Bridging Digital Divides in the Learning Process: Challenges of Integrating ICTs in Learning

Janak Adhikari
Massey University

David Parsons
Massey University

This study is investigating the phenomenon of digital divides, in the context of integrating one-to-one ICTs into the learning process. For this purpose, we are studying a ‘bring your own device’ (BYOD) initiative by a New Zealand School. This poster discusses the background and agenda of the study, as well as some of the initial findings from an analysis of the baseline data.

Keywords: ICT integration, digital divide, learning outcomes

Background of the Study

Based on the potential benefits and opportunities that the introduction of ICTs can bring to students’ learning, educational organizations have developed projects and policies to make the learning process more engaging and participative by integrating ICTs to generate better academic outcomes (Anderson, 2009; Prestridge, 2007). Although the introduction of ICTs provides potentially valuable resources for learners’ educational and social development (Demiraslan & Usluel, 2008), previous digital opportunities projects in New Zealand show that it might end up contributing nothing more than just an effort to facilitate material access to ICTs (Rivers & Rivers, 2004). The Digital Opportunities Project was an initiative by the New Zealand government in collaboration with participating schools and associated businesses aiming to assist in bridging the digital divide in low decile schools by providing (a) material access (b) professional development, and (c) infrastructure to promote collaboration. Despite good strategy and infrastructural support, the overall goal of bridging the digital divide was not achieved (Bolstad, 2004; Parr & Ward, 2004; Rivers & Rivers, 2004; Winter, 2004a, 2004b).

The results and experiences from the digital opportunities pilot projects raised several implications for future ICT interventions of a similar kind. It has also raised the question of whether we are doing everything required to attain the goal of achieving digital inclusion for every student in the learning process. In other words, is achieving digital inclusion in access and capability sufficient, or is there any other aspect that needs to be taken into account when integrating ICTs into the learning process? To address the concerns that emerged from the initial digital opportunity projects, the Ministry of Education announced an ICT strategic framework for education in 2006. The goal of ICT strategic framework was to develop a more student-centered learning culture where education agencies and organisations focus on the students’ learning outcomes rather than the technology. However, even after the strategic framework for education there are still some unanswered questions around why these projects are still not very successful in equalising digital inclusion in the context of integrating ICTs into the learning process.

Agenda for the Study

Investigation of past and current digital opportunities projects shows that these projects are not very successful in achieving equalised digital inclusion for every student. Therefore there is a need to rethink the digital divides in learning underpinning the concept of ICT initiatives.

The opportunity to have equitable material access to ICTs and digital capability can be the necessary first step towards digital inclusion for every student, but is not sufficient. Therefore, to attain the complete digital inclusion for every student and to bridge digital divides in the learning process, we need to look at aspects of the digital divide beyond just access and capability, which has not been taken into account by the previous initiatives. This additional aspect is the learning outcomes of the student participating in the ICT mediated learning process. According to Wei, Teo, Chan, & Tan (2011), as ICT adoption advances there arise newer forms of digital divide, and even after ensuring the equalised digital access and digital capability, there is a possibility of having differences in the outcomes achieved by the individuals (in saying this, the access and capability aspects are still important because these divides are still persistent and could impact negatively on digital inclusion and students’ learning outcomes). Based on the relevant literature and the investigation of past and current ICT initiatives in New Zealand, we have been able to identify some factors which have the potential to affect the learning process mediated by one-to-one ICTs, and might also impact the digital inclusion of every student from the perspective of learning outcomes. These factors are: (a) attitude and motivation of individual learner towards ICTs, (b) nature of ICT usage, and (c) learners' capability of meaning making. Therefore, these factors should be investigated in depth to find the impact of these on digital inclusion. The BYOD project provides an opportunity to investigate these factors in a real world context of integrating one-to-one ICTs into learning.

Findings from Baseline Data

The baseline data has already been collected and analysed. This helped us to draw some preliminary conclusions. Some key findings of the analysis of the baseline data, which are of significant interest to us, are as follows:

Top 5 Positives:

1. Students can gather information quickly and easily from various sources.
2. Students don't need to carry books etc., just one device.
3. Engagement of students in learning activities has improved.
4. Students carry and use their devices anytime and anywhere they want.
5. Students do many other activities to improve their learning experience. E.g. take photos and record videos of their performance in dance, drama, and physical education.

Top 5 Negatives:

1. Distraction and lack of control in the classroom.
2. Internet problems and non-recommended devices disrupt learning activities.
3. Digital devices do not prepare students for written exams.
4. Negative impact on the students' critical thinking.
5. Increased teacher workload.

Top 5 Findings:

1. Some students do not have adequate access to ICTs, including one-to-one device ownership
2. More than half the students spend most of their digital time in activities other than learning
3. There is a significant difference in the level of digital and information literacy among students
4. Teachers tend to focus on one specific device
5. Teachers are continuing with their old method of instruction (i.e. teacher to classroom).

Students are seeking flexible study opportunities. Smartphones have potential to support learning at times and places chosen by learners but their introduction presents challenges in negotiating the changes in the behaviour of learners and in the materials and activities provided by university courses. This project, funded by DEHub in two Queensland universities, explored how students used mobile devices with many characteristics of smartphones. This paper reports on the first phase that investigated the changes required to facilitate access to course materials and activities using the devices. Data have been viewed through the lens of activity theory. The results confirmed the need for developing skills and managing expectations of learners and academics and for adjustments to design of course materials and delivery systems to facilitate access.

Keywords: mlearning, activity theory, teacher education, smartphone, iPod Touch, distance education, online education

Introduction and background

Family and work commitments are prompting more students to choose distance or online modes of study for all or part of their degrees. Implicit in their decisions is a desire for flexibility that can be limited by the delivery of bulky printed materials or media that require computers for access. One challenge faced by universities is the provision of flexible study opportunities that match the needs of students.

We live in an age of *mobilism* and access by learners to personal mobile computing devices is becoming commonplace (Norris & Soloway, 2011). Devices small enough to be ‘always’ carried by the user could overcome many barriers that limit access to study material and support more flexible distance or online learning. Although developed primarily for business and entertainment, many current mobile devices are powerful computers capable of running educational applications.

Smartphones are significant because they merge telephone, Internet-connected computer, camera (still and video), audio recorder and player, and ebook reader. Of the 89% of Australian adults owning a mobile phone in April 2011, 37% had a smartphone and the number of users going online with their mobile phone had increased by 63% from 2.4 million to 3.9 million between June 2010 and June 2011 (ACMA, 2011). Smartphones, and similar devices, offer learners more options for ‘anywhere, anytime’ learning than do larger portable devices such as laptops. They can store learning materials for later access or support remote synchronous or asynchronous interaction with content, teaching staff, and peers. As more students have access to smartphones and a growing preference for flexible learning, it is important that universities investigate both the potential of smartphones for learning and the changes that may be necessary to facilitate their use.

Literature review

Australian undergraduates include many mature students seeking career change opportunities. In 2009, 24% of Australian undergraduates were aged 25 or older and 15% were older than 30 years (DEEWR, 2010). The proportion varies across universities and disciplines with a survey of final year teacher education students reporting 45% aged 25 or older and 10% aged 40 or older (DEST, 2006). Many of these students have family and employment commitments that affect their availability for on campus classes. In 2006 the typical Australian university student was undertaking substantial paid employment during the semester (James, Bexley, Devlin, & Marginson, 2007), with as many as 70% of full-time undergraduates working almost 15 hours per week on average, 15% working more than 20 hours per week, and almost 5% working full-time. It is not surprising that students seek flexible options to meet individual needs for balancing study, family and work commitments.

From 2001 to 2010 the proportion of Australian undergraduates studying part-time declined from 27% to 21% (DEEWR, 2011). Over the same period the proportion of undergraduates studying in internal (on campus) mode remained steady at 83% to 84%, while external enrolments decreased from 13% to 8% and multi-modal enrolments (study units taken partially internally and partially externally) rose from 4% to 8%. For USQ from 2006 to 2010 undergraduate enrolment density (ratio of head count enrolments to full-time equivalent load) decreased slightly from 1.99 to 1.86, indicating a slight increase in the proportion of full-time students. Over the same period internal and external enrolments reduced from 15% and 75% to 13% and 74% respectively while multi-modal enrolments rose from 10% to 13%. The number of web-based subjects offered rose from 119 to 198 and web-based student enrolments rose from 2676 to 12485, an increase of more than 400% (USQ, 2012). These trends are reflected in the observation that in 2012 up to 70% of Bachelor of Education students at USQ are studying at least some subjects online. Moreover students studying on campus are likely to access some of their study materials and activities from online sources. The evidence suggests that flexibility of study is increasingly important to students and that the mobility afforded by smartphones and similar devices will be part of the solution for meeting the need for flexible study options for students. Hence it is important to understand both the potential and the implications of adopting and adapting mobile technologies for learning and teaching.

Affordances and limitations of mobile devices

Cheung and Hew (2009) referred to “mobile handheld devices as any small machines that can be carried easily in one's palm and provide computing, as well as information storage and retrieval capabilities.” Wireless Handheld Devices (WHDs) represent a subset of such devices with affordances that render them highly appropriate as learning tools in distance education (Soloway, Norris, Blumenfeld, & Fishman, 2001). Figure 1 represents the relationship between WHDs and related devices.

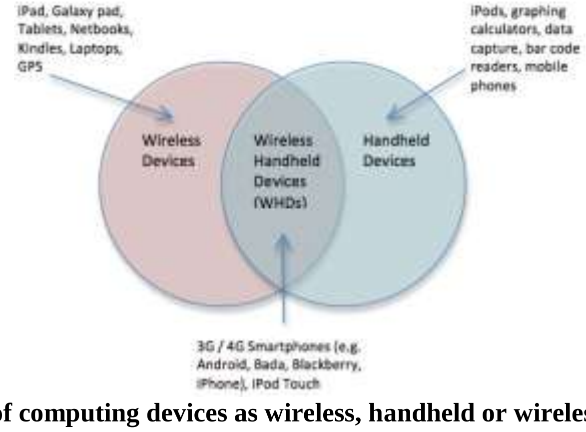

Figure 1: Categorization of computing devices as wireless, handheld or wireless handheld devices (WHD)

WHDs exhibit properties, including portability, potential for social interactivity, context sensitivity, connectivity, personal ownership, and ease of use, that can facilitate collaborative mobile learning (Naismith, Lonsdale, Vavoula, & Sharples, 2004). They are a comparatively inexpensive means for students to access multimedia content and communicate but are subject to constraints imposed by physical, logical and socio-cultural factors (Song, 2011). Physical constraints include screen size, slow processors, difficulty with text input and limited functionality. Logical constraints include availability and price of appropriate programs, difficulties in ending programs, and system instability. Socio-cultural factors include user expectations and preferences.

mLearning

Because this study investigated learning at a distance it is useful to review the praxis between distance education and mobility. Initially mLearning was viewed as a variant of distance education, which could occur at any place and time unlike conventional education that occurred at a set place and time (Keegan, 2005). The flexibility of distance education was curtailed by online learning because it required access to information from a desktop computer (Dye, Fagerberg, & Rekkedall, 2005). WHDs promise to restore flexibility to the distance learner.

Distance Education has been conceptually refined to encompass Contextual Life-long Learning (CoLL) which holds that learning is not confined to specified times and places and that traditional education cannot provide all the knowledge and skills people need to prosper throughout life (Sharples, 2000). Technologies to support CoLL need to be portable, individual, unobtrusive, available anywhere, adaptable to context of learning, and relevant to the learner's evolving skills and knowledge, persistent, useful, and easy to use (Jueming Chen, 2005). WHDs, as described above, meet these requirements.

Technologies, from posted print materials to synchronous online interaction, have always mediated the experience of distance education. As technologies change, so does pedagogy. Recent thinking recognises that new generations have not supplanted what has gone before but that layers have been added for a more complete experience embracing elements of behaviourism, constructivism, and connectivism (Anderson & Dron, 2011). Recent expansion of online learning raises questions about the nature of interaction in distance education. Moore (1993) suggested that distance in distance education is about psychological rather than geographical distance and introduced the concept of transactional distance. In an earlier paper he had clarified understanding of interaction in learning as being of the learner with content, instructor and other learners (Moore, 1989). WHDs have potential to make all three forms of interaction more conveniently available at diverse times and places, thereby enhancing learning by reducing transactional distance between learner and teacher and between learner and learner. However, for this to be achieved it is important to understand how the introduction of WHDs affects the interactions of university learners and teachers, which in turn has pedagogical implications.

Activity theory

The affordances of WHDs make them potentially useful for learning but determining their suitability requires understanding of the pedagogy appropriate to such devices. In this paper we will use Activity Theory as a lens for examining the effect of WHDs on the experiences of university learners and teachers. Activity Theory aims to understand human beings in their natural, daily circumstances through analysis of the genesis, structure, and processes of their activities. Activity is understood as a purposeful interaction of the subject with the world, a process in which mutual transformations between the poles of ‘subject–object’, via the use of tools, are accomplished (Kaptelinin & Nardi, 2006). Engeström (1987) reconceptualised Activity Theory from the initial subject-tools-object triangle into a six element model (Figure 2) which has become an analytical tool used in a wide range of educational research (Blin & Munro, 2008; Larkin & Finger, 2011; Lloyd & Albion, 2009).

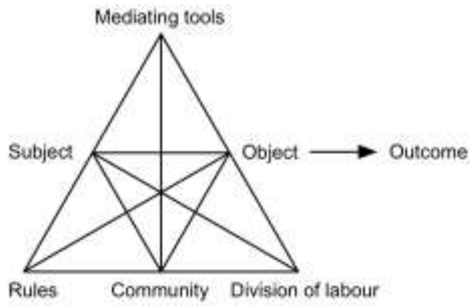

Figure 2. An Activity System (Engeström, 1987, p. 37)

Engeström's (1987) framework provides a tool for examining the various socio-cultural elements that affect the relationship between the subject and the community in attaining an outcome. Individuals and the community grow through the resolution of tensions and contradictions leading to transformations and expansions within the system. Contradictions exist when external influences change elements of activities causing imbalances between them, for example, the introduction of the iPod Touch in this study as a means of accessing course materials. Consequently, Activity Systems are almost always in flux as they work through contradictions that manifest themselves as problems, ruptures, breakdowns, or clashes (Scanlon & Issroff, 2005).

Appropriateness of Activity Theory to conceptualise use of WHDs

Activity Theory and its iteration as Activity Systems allow the researcher to critically examine the praxis between individual and society, and between object and subject, seeking to explain cognitive development through psychological processes driven by the individual but mediated by a variety of tools in a context (Larkin, 2010). It provides a coherent, theoretical framework to investigate multi-faceted sites to provide a broad and deep account of the actions of people as an activity unfolds over a period of time.

Activity Theory has been used by previous researchers in mobile learning and was used as the basis for a proposed “theory of learning for the mobile age” (Sharples, Taylor & Vavoula, 2010). Other researchers have identified limitations of Activity Theory as a basis for studies of mobile learning and suggested that an ecological approach would be more appropriate (Pachler, Bachmair & Cook, 2010). Nevertheless, Activity Theory was adopted for this study because of the prior experience of team members undertaking studies using Activity Theory (Lloyd & Albion, 2009; Larkin, 2010), and three features of Engeström’s (1987) Activity Systems that render it appropriate to our research context. First the collective activity system is taken as a unit of analysis, giving context and meaning to seemingly random events; second, the activity system and its components are understood historically; and third, inner contradictions of the activity system are analysed as the source of the disruption, change and development of that system (Young, 2005). This research adds to the body of knowledge by using Activity Systems to reveal systemic contradictions and transformations stemming from the use of WHDs in a higher education and distance learning context.

Method

The research was conducted in two Queensland universities during 2011 and 2012 in the context of undergraduate Education and Nursing courses. Each university had 40 iPod Touch devices available for distribution to distance or online students in selected Nursing and Education subjects who responded to invitations to participate.

Data to enable rich descriptions of cases based on participating classes were collected using:
1. A pre-test & post-test survey based on previously validated instruments,
2. Reflections by students and facilitators logged in an online system,
3. Interviews conducted with student participants,
4. Online discussion forums involving students and facilitators, and
5. Software developed to record applications installed on returned iPods.

Although the primary focus of the research was on the use of the iPods for learning, the researchers were interested in any use of the iPods, including personal use (even that by other family members) because of the potential effects on the participants’ learning activity systems. This paper reports data from participating Education students at one university in the first semester of the project. Other papers will report data from the broader group of participants across both semesters.

Participants and setting

Participants for whom data are reported in this paper comprised distance students completing an ICT and pedagogy course within a Bachelor of Education program at a regional university. The course explores the use of ICT for teaching and learning within school classrooms and included students from Early Childhood, Primary, Secondary, and Special Education specializations within the third year of a four year program. Participating students volunteered to use the iPod for course learning purposes and also during their professional experience where possible.

Twenty iPod touches were available for distribution and two students joined the project using their own iPhones. During the semester three students withdrew due to workload commitments, leaving 19 participants who completed the semester in the project. Each student completed a research consent form and an acceptable usage agreement form. The iPods, and iTunes gift cards ($30) to support the purchase of relevant software, were distributed to the volunteers by regular mail.

The course was offered online using the Moodle learning management system to provide recorded lectures, learning activities, additional readings, and facilitated online discussions related to the course content and assessment. Materials were not modified for mobile delivery in the first semester of this project. Students in the iPod project were supported within the Moodle space through a separate area that included information on how to use iPods, online discussion areas for asynchronous discussion, synchronous discussion opportunities through Wimba, and links to project documentation such as consent forms and surveys. It also provided wikis for students to share ways of learning with WHDs, including their use in classrooms.

Data collection

Questionnaires

Questionnaires were administered online using LimeSurvey® (www.limesurvey.org) in the first and last weeks of semester. Data were transferred to SPSS 19 for analysis. They included multiple scales, each comprising several statements to which participants registered levels of agreement on a 5-point Likert scale from strongly disagree (1) to strongly agree (5), except for the frequency of use scale which used a 6-point scale (1=Not Used; 2=Once/twice a semester; 3=Once/twice a month; 4=Once/twice a week; 5=Once a day; 6=Several times a day**)**. The scales addressed interest in and attitude toward using ICT for learning (13 items), expected (actual in the post-test) ease of use of the iPod Touch for learning (6 items), expected (actual in the post-test) usefulness of the iPod Touch for learning (6 items), frequency of use of ICT (iPod Touch in the post-test) for various study activities (30 items), and desirability of a mobile device for study (13 items). Scores on the scales were calculated and reported as average ratings.

Qualitative data collection

Reflections were collected online, with the students and the facilitator completing the online form every two to three weeks. The reflections, online discussion archives and interview data were analyzed using the constant comparison method. The researchers searched for common themes and patterns within the data and inconsistencies were also noted. On receipt of the iPods returned by the participants software was used record the applications installed on the iPods.

Results

Survey data

From the 19 Education students who participated, 10 completed data sets matched for pre-test and post-test were extracted for analysis. The students were asked to record their access to various ICT hardware and services. All reported exclusive access to a computer, with nine having access to a laptop. While all of the students had home broadband Internet access, eight did not know the speed of their connection but agreed it was fast enough. Of the remaining two students, one had a connection speed of 8000kbps and the other had 1500kbps. Five of the students had a home monthly data limit of 10GB or more, one student had between 5 and 10GB and three students had between 1 and 5GB. Given these levels of Internet access, all would have been able to access study materials in the LMS. Most students reported limited or no access to portable devices such as MP3 players, eBook readers or tablet devices suggesting that addition of an iPod Touch would be a significant change in their access to ICT but also that lack of experience might result in some time being required for familiarization.

The pre- and post-test data for the 10 students were compared using paired samples *t*-tests for each of the five scales described above and these results are presented in Table 1. Mean differences were calculated as pre - post so that positive values represent a decrease in mean rating from pre- to post-test.

Table 1: Analysis of changes in ratings on the 5 key scales (N = 10)

	Paired Differences							
	Mean Diff	Std. Devn	Std Err Mean	95% Confidence Interval of the difference		*t*	df	Sig. (2-tailed)
				Lower	Upper			
Interest in & attitude to ICT for learning	-.046	.224	.071	-.206	.114	-.651	9	.531
Ease of Use of iPod Touch for learning	.350	.506	.160	-.012	.712	2.188	9	.056
Usefulness of iPod Touch for learning	.800	.987	.312	.094	1.506	2.563	9	.031
Frequency of Use in learning	1.803	.721	.228	1.288	2.319	7.915	9	.000
Desirability of iPod touch for learning	1.115	1.280	.405	.200	2.031	2.755	9	.022

As is evident in Table 1, interest in and attitude to use of ICT for learning increased slightly (pre-test mean = 4.38, post-test mean = 4.42), but not significantly, across the semester and expectations about ease of use of the iPod Touch decreased slightly (pre-test mean = 3.47, post-test mean = 3.12), but not significantly. Measures for usefulness of the iPod Touch for learning (pre-test = 3.30, post-test = 2.50), frequency of use (ICT on pre-test, iPod Touch on post-test) for learning (pre-test = 3.65, post-test = 1.85), and desirability of the iPod Touch for learning (pre-test = 3.82, post-test = 2.70) all recorded statistically significant ($p < .05$) decreases across the semester. Individual items from those measures were inspected for patterns that might explain the differences.

The six items on the usefulness scale had registered between 3.1 and 3.7 on the pre-test and decreased to 2.4 to 2.6 on the post-test suggesting that expectations about the iPod enabling quicker and easier access to course materials and enhancing communication were not realized. The decreases were reasonably consistent across the scale items with no evident pattern.

The frequency of use scale on the pre-test referred to use of ICT and included some tasks (e.g., create and present multimedia, upload files) that might not be possible using the iPod Touch and others (e.g., publish podcasts or other audio files, maintain a blog as part of course requirements) that were not required in the course. In that light it would be surprising if responses to post-test items phrased to ask about actual use of the iPod Touch had attracted agreement as strong as those recorded on equivalent pre-test items asking about potential use of generic ICT for the same purposes in the absence of sure knowledge of course requirements. Items that scored higher average responses related to looking up reference information on the web (3.0), accessing social networks (2.9), email (2.8), downloading course files (2.8) and accessing study material (2.7). These averages are on a scale where 3 indicated once or twice a month.

The scale referred to as "Desirability of iPod Touch for learning" sought agreement (or not) with 13 reasons for using WHDs for study purposes. The statistically significant decrease on that scale was driven by a decrease on all 13 items with the extent of change varying from 0.8 (easier and more frequent communication with peers) to 1.9 (better understanding of subject material). Items with smaller decreases (less than the mean decrease of 1.12) focused on ease and frequency of communication with peers or lecturers, better results, increased general ICT skills, and convenience for completing course work. Items with larger decreases were those related to having a wider range of tools for study, improved career prospects, and better understanding of the subject.

Qualitative data

Initial analysis of the text of student responses identified frequently occurring words (including 'access', 'lectures', 'information', 'people', and 'remote') that could be used as starting points for thematic analysis. Text was scanned to generate a key phrase list, which was used to tag responses from individual respondents to each of the questions that had been posed to them. This tagging of participants' responses against the key phrase list was used in Microsoft Excel to produce a frequency table and associated radar chart (Figure 3 below) showing the relative frequencies with which identified themes appeared in responses to three key questions.

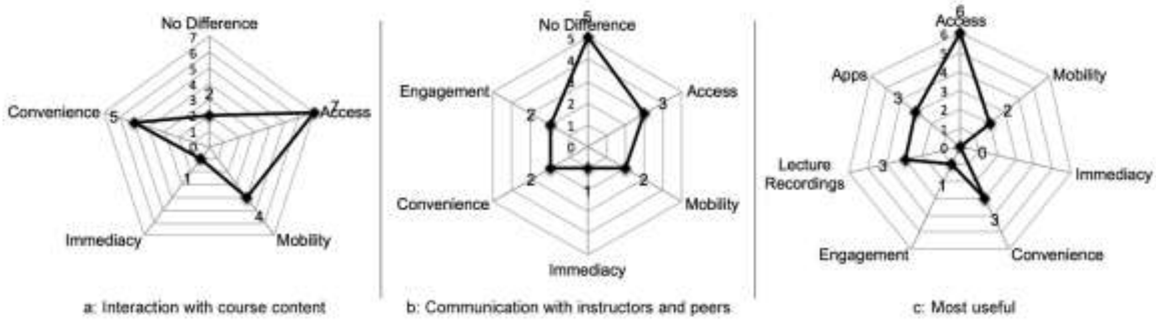

Figure 3: Radar plots of key themes from student interview data

The first question asked about differences that the iPod Touch may have made to interaction with course content (Figure 3a). Major themes in the responses were *access*, *convenience* and *mobility* with comments including being "able to listen to lectures while I walked my dogs" and "time management [becoming] less of an issue because I didn't have to rely on my home computer to access…readings and tools." One respondent mentioned *immediacy* of access "at the drop of a hat without having to set up my laptop and wait for it to load."

The second question asked about changes to patterns of communication with instructors and peers (Figure 3b). Most participants reported no difference but where changes occurred they mostly related to access, mobility, convenience, and engagement. Specific comments referred to more convenient access to email "instead of having to turn on my laptop", to access while away from home, and to being "able to record myself in the car and while taking part in normal day to day activities that I could then recall and send to my lecturers and peers."

The third question asked what participants found most useful about the iPod Touch (Figure 3c). The dominant theme was *access*, represented by comments about use away from home, mobility facilitated by the small size, and being able to watch or listen to recorded lectures "while I walked my dogs."

Across the three questions the most common themes were *access* (16 instances), *convenience* (10), and *mobility* (8) but these three and other concepts were often linked in a single statement, for example, the student who reported using the iPod to "listen to lectures while I walked my dogs." Most participants reported no change to communication resulting from the iPod; changes to interaction with course content were more numerous; and the responses for *access* in the question concerning the most useful aspects were predominantly about accessing recorded lectures or other course material.

Discussion

As noted in the literature review, Activity Theory provides a useful framework for conceptualizing the interactions of human beings with the various components of systems with which they interact in order to accomplish desired outcomes. Figure 2 represented the relationships among components in a generalized activity system. Figure 4 presents possible representations of the salient components of the activity systems experienced by students and academics participating in this study. In each case the generalized labels have been substituted with labels particular to the systems under consideration in this study. The activity systems experienced by students and academics will interact and have common components, some of which are apparent in the labels. Although the real activity systems will be more complex and will vary for individuals the representations include what we believe to be the most significant elements from this study.

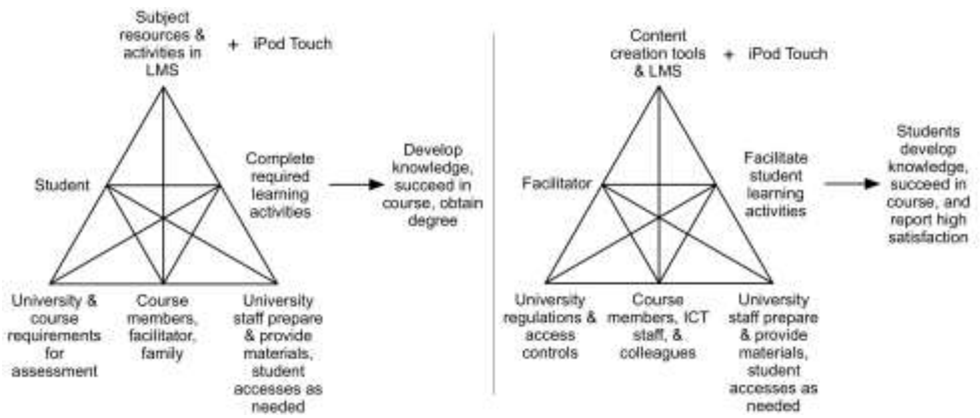

Figure 4: Activity systems experienced by students and academic facilitators

Students are represented as directing their activity toward successful completion of required learning activities as the object in their activity system with their outcome being to pass the subject and ultimately their degree. The object and outcome for the academic facilitators are related to those for the students but with a difference in emphasis on facilitating student completion resulting in passes and satisfaction with the course. Other parts of the systems are similarly parallel with variations in perspective according to the different roles being played in the systems. In each case the addition of the iPod Touch to the available tools represents a potential contradiction to the system that will affect, and be affected by, other elements of the system.

The results presented in the previous section offer some insights into how the introduction of an iPod Touch might have affected the activity systems being experienced by these student participants. Students reported positive attitudes toward the use of ICT for learning, together with levels of availability of computers and Internet connectivity that would have enabled them to conveniently access course materials and interactions through the LMS when at home or in similarly equipped locations. Most students reported limited or no access to mobile devices suggesting that access to an iPod Touch would increase the variety of locations in which they might be able to access suitably packaged course content and learning interactions.

These expectations were reflected in their responses to the questionnaire at the beginning of the semester. On the 'ease of use' scale they expected that it would be easy to learn how to use the iPod (mean = 3.8) and to get it to do what they wanted in the course (3.6), which appeared to focus more on communication with staff (3.6) and peers (3.4) rather than on access to materials (3.2) or completion of assessment (3.2). Expectations about 'usefulness' focused on increased interaction with course materials (3.7), increased communication with staff and peers (3.4), easier completion of the course (3.4) and improvements in results (3.1) through being able to work more quickly (3.1) and easily (3.1). Among these expectations the only one that was realized was the ease of learning to use the iPod, which registered an increase in mean rating from 3.8 (pre) to 4.3 (post). Every other item on the scales for 'ease of use' and 'usefulness' recorded a decrease from pre-test to post-test. Items with larger (greater than average) decreases in mean scores from pre-test to post-test included those that focused on communication, ease of completing assessment and the course, and increased interaction with course materials. The latter recorded the largest change of all items from 3.7 (pre) to 2.5 (post) which is somewhat surprising in light of the qualitative data in which accessing course materials, especially recordings, emerged as a major theme. The explanation may lie in the change being in the mode and location of access to materials rather than an increase in *amount* of access. Another explanation may be that the type or format of the materials limited the affordances of mobility because some are less than satisfactory on current WHDs. For example, PDF files may not zoom or, if they do, require inconvenient horizontal scrolling to read.

From the perspective of the activity system, students clearly anticipated the introduction of the iPod Touch as an additional tool to bring changes that would facilitate their achievement of the object and outcome. However, the effects in most areas were less than anticipated. At least part of this may be attributable to the short time over which the project ran. Allowing for time taken to recruit students for the project, distribute the iPods and return them at end of semester, and for the 3 weeks during which students were on professional experience, the participants had approximately 9 to 10 weeks of regular class time during which to experience working with the iPod Touch. Expectations about it being easy to learn to use were fulfilled but students may have needed some time to learn its use and may not have discovered all the functionality either inherent in the device and its OS or available through installable apps. Moreover, the short timeframe limited the time available for course leaders to identify, from student feedback, the resources that were problematic and provide alternatives. If course resources are to be device-independent and WHD-friendly, course leaders will need time to experiment with a range of devices to ensure maximum accessibility for students using these devices.

The course materials in this course were not modified specifically to support access using the iPod but the file formats provided in the course (.htm, .doc, .ppt, .pdf, .mp4, .mp3) were capable of being accessed using the iPod touch. Some files could be downloaded and stored for later access on the iPod Touch without access to a computer, some could be streamed while connected to the Internet, but some could be downloaded only on a computer and then transferred to the iPod, limiting the potential of the device to be the 'total' access solution. However, access to audio content, supported by the mobile devices would not have been possible otherwise for some students. Although it appears that the total amount of interaction with materials did not increase as a result, students reported greater mobility of use, for example, while mowing or walking the dog. The iPod has therefore had a perceptible effect on the activity system with regard to access to and use of course materials.

Introduction of the iPods brought fewer benefits for communication than students had anticipated. In part, this may have resulted from restricted network connectivity (WiFi only where available) of the iPod compared to a smartphone, but part will have resulted from interaction between the iPod and other tools in the activity system. Synchronous communication in the course used Wimba, which requires Java and as a consequence does not work on the iPod. Asynchronous communication using the discussion forums in the LMS (Moodle) is possible but sometimes awkward because the default configuration of the LMS is not well tuned for use on the smaller screens of mobile devices. Some students mentioned using the iPod successfully for email but other modes of communication characteristic of small mobile devices (SMS, Twitter, Facebook) are not officially supported by the university and may or may not have been in use by members of the course community in the activity system. Thus the iPod had only a limited effect on communication within the course activity system because of technical limitations in the device and historical factors in the existing tools, rules and community of the activity system.

In seeking to understand the effect of introducing the iPod Touch on the course activity system it is also important to consider the system also from the alternative perspective of the facilitator responsible for the course. As described in the section about participants and setting, although there was a specific section of the LMS space developed to facilitate students participating in the iPod project the first semester of iPod Touch use in the course involved no significant modification of course materials to support the new device. The division of labour is a key node in this activity system, with the facilitator providing links and creating the spaces for interaction and students using the links and contributing experiences in the forum. Like the students, the facilitator was constrained by the existing tools in the system that had variable levels of usability with the iPods. Resources on the web were generally accessible from the iPod by following the links provided; discussion forums were workable with effort; Wimba could not be used; and the format, and ease of downloading for offline use, of recorded materials was determined by the standard tools (Camtasia Relay) available as part of the university learning and teaching systems. Rules in the activity system, in the form of university regulations and controls on access to systems, effectively constrained the use of the iPods to substituting for a computer to access existing types of materials and interactions. Provision of materials in different formats; the inclusion of Web-based activities; and assessments that used the capabilities of the iPod to capture, create, and submit student-generated content, were restricted by existing system capabilities or university regulations that would have required more time than was available to negotiate adjustments to the course. These limitations by rules and access to technical support within the community element of the activity system may have caused contradictions between student and object that resulted in students' expectations for access to material, communications and assessment not being realized.

Conclusion

This study has limitations associated with its small size (19 student participants), restricted context (a single Education course) and limited timeline (a single semester with limited preparation). However, despite those limitations it has demonstrated the potential for WHDs to disrupt existing activity systems by facilitating access to study materials at a wider variety of times and locations. It has also identified elements of the learning activity system that may need modification in order to facilitate greater use of WHDs and suggests areas in which attention to course design might enable more of the potential of WHDs for learning to be realized.

Although students were able to access most course content using the iPod Touch, there are changes that could usefully be made to improve readability on the small screen and to make it more convenient to download files from the LMS for storage and offline use on the device. These considerations apply to all WHDs even smartphones, which are likely to be more frequently connected to the network than the WiFi-only iPod touch but can still benefit from offline access for savings of time and data costs. Communication within the constraints of existing university systems presented more challenges. The LMS and associated systems need to be reviewed for compatibility with smaller screens and there are likely benefits in considering options for shorter form communications characteristic of mobile users. SMS, Twitter and Facebook exemplify messaging that works well on mobile devices and similar functionality could be incorporated within the LMS or associated systems.

Both students and facilitators require time to become familiar with the core and extended functionality of WHDs before their true potential for learning and teaching can be realized. As the capabilities of such devices evolve it will be important for university regulations and systems, the 'rules' and 'division of labour' of activity systems, to provide for creative exploration of the possibilities for delivery of content to learners, communication within the learning environment, and the collection, possibly for assessment, of content captured or generated by students using WHDs. Shared exploration by learners and teachers will be important in enabling universities to address the challenges of providing students with the flexible learning opportunities they are seeking.

Creativity in practice: social media in higher education

Belinda Allen
Learning and Teaching Unit/School of Education

Creativity, both as a professional capability and as a personal attribute, is acknowledged as an important dimension of education for a fast-changing world, relevant to future practice in the professions and for learners and teachers. New social media tools, which place creation, publication and critique in the hands of web users, have been recognised as having a role in democratising creativity, making the means of production and distribution accessible to most of the developed world. Using these tools to facilitate learning activities in higher education can promote creativity and many other related capabilities: digital literacy, independent learning, collaboration and communication skills, and critical thinking. It requires creativity on the part of teachers to develop and manage learning environments and tasks that are not traditional and may be quite experimental. This paper asks some university teachers who are innovating their teaching by using social media to reflect on how creativity informs their practice and the learning of their students.

Keywords: creativity, social media, higher education, graduate capabilities, digital literacy

Creativity in Higher Education (HE)

In learning for the future, creativity as an aspirational graduate attribute in higher education is related to demands from business and industry for creative graduates able to devise innovative solutions to complex problems in the new millennium knowledge economies of the developed (and increasingly the developing) world (Amabile, 1996; Pink, 2005). Progressive educationalists have revived calls to embrace a holistic education that develops all aspects of human personality and potential, including creativity (Robinson, 2000; Jackson, 2006). Creativity can be understood as systemic – a product of personal creative activity within a particular context which supports and recognises it (Csikszentmihalyi, 1999). As a personal quality, creativity can be characterised more as a disposition than a specific skill, and related to identity formation rather than knowledge. Dispositional aspects of creativity include preparedness to take risks, curiosity and perseverance. Generic graduate capabilities such as independent learning, communication, critical thinking, problem-solving and inter-disciplinary practice can all relate to a disposition for creativity.

Creative teaching and learning

Academics and students perceive creativity as a learning outcome to be closely related to creative learning activities, and creative approaches in teaching and assessment (Fryer, 2006; McWilliam & Dawson, 2007). It has also been suggested that an effective way to teach creativity is to model creative practice for students (Sternberg, 1996). Taking a creative approach to teaching, which may encompass collaborative activity, incorporating fun and play, and devolving responsibility for learning to students, is likely to be challenging to most university teachers who have not themselves had such creative models. Creative dispositional qualities already mentioned such as risk-taking and collaboration, as well as a creative approach to 'designing' a learning environment and activities which support creativity, must be brought to the teaching situation. Teachers, no less than students, need the ability to critically reflect on their creative activities to ensure that outcomes are met.

Digital literacy for creative learning

Digital literacy is also emerging as a critical capability for the future. The Horizon Report for 2012 (New Media Consortium, 2012), which is concerned with identifying trends in technology and new media for education, identifies several key trends relating to contemporary learning contexts and creative inquiry. These include the growing use of cloud-based technologies, the increasingly collaborative nature of work, and the more flexible and personalised nature of learning experiences. While a currently popular view is that the ‘net generation’ are ‘digital natives’ who are comfortable in a technology-mediated world, research indicates that student use of and skills with technologies are not uniform, and tend to be focused on ad hoc uses of established technologies (Kennedy et al, 2010). Simultaneous with shifts in technology use, ways of managing information in the world have evolved from ownership and guardianship of knowledge to ‘knowledge networking’ (Allen & Long, 2009), making digital literacy an important component of the information literacy that graduates must develop. Higher education needs to have a role in both enabling learners to manage the abundance of resources and relationships that are accessible via the internet, and in positioning them as leaders in the development and use of digital tools for knowledge management and production.

Social media for learning

The growth of the social software applications characterised as ‘social media’ that lie at the heart of Web 2.0 has been matched by the growing interest of educators who see this as an important extension of the closed functionality of the traditional Learning Management System (LMS) (Dalsgaard, 2006). A common theme underlying much current commentary on the educational web is how the user-participation and production functionality of social media opens up new approaches to learning and teaching, and challenges the traditional roles of learners and teachers (Allen, 2011; Downes, 2011). Social media tools, being socially-oriented and democratically organised, are not only more conducive to communication and collaboration, but control (and responsibility) are moving into the hands of the learner.

Technology-mediation of activities is now significant in everyday life and work, yet authentic contexts for integration of technology into pedagogy have been slow to develop. The kind of activities suggested by an authentic, learner-directed pedagogy have been hitherto poorly supported by learning technologies designed around teacher-centred pedagogy, and institutional administrative requirements. The NMC report (2012, p.6) warns that “Digital media literacy continues its rise in importance as a key skill in every discipline and profession”, but “Institutional barriers present formidable challenges to moving forward in a constructive way with emerging technologies”. The use of social media tools for teaching and learning is not systematically supported in most higher education institutions, hamstrung by policy issues around IP, copyright and security of data. However, many academics, finding that institutionally provided systems do not offer flexibility, are independently realising the benefits of innovating their teaching in this space.

Case studies

Following are examples from The University of New South Wales, where social media tools have been used to foster student interaction and participation. While creativity was not explicitly stated as a learning outcome in these instances, the course conveners reflect on how their ideas of creativity in teaching and learning were represented in the course design and its outcomes.

Collaboration and critique in Wikis (Helen Caple, School of the Arts and Media)

A first-year undergraduate media gateway course, ‘Media, Society, Politics’, makes use of the collaborative attributes of wikis in designing and assessing an online group assessment project. In terms of creativity, this project has significant implications both for the student learning experience and for the assessment protocol for the tutors involved in marking this project.

Like other social media technologies, wikis maximise the “architecture of participation” (Gross Davis, 2009, p. 181), by allowing multiple users to write and edit a web document. Versatility in content management and display in wikis means that contributors can reference a variety of different media types in the wiki page, including text, embedded (or externally linked) video, audio, pdfs, slideshows, and still images, to name but a few. Thus the architecture of the page is limited only by the creativity of the contributors.

At the same time, wikis provide complete transparency in who has contributed what and when to the page (since all page edits are tracked and stored in a page ‘history’). Such transparency impacts greatly on how tutors are able to assess the group project. It is well-known that one of the major concerns with group work lies in how the project is assessed, both in terms of what is assessed (process and/or product) and how marks are to be allocated, for instance, to the group, to the individual, to be distributed among the members, through peer review (Lejk et al, 1996). Assessing the process may mean measuring the individual’s contribution to the group or to the task, time spent on the project or the quality/quantity of work produced (Sharp 2006, Orr 2010), and gathering reliable evidence of such contributions is a major challenge. Assessing only the final product leads to inevitable inequities in the allocation of grades where the efforts of hard working students may be missed and students who ‘free ride’ are unjustly rewarded (James et al, 2002, p. 48; Pieterse and Thompson, 2010, p. 356). Wikis provide creative solutions to such issues in that they allow tutors to monitor, and consequently assess, both the *process* and the *product* of the group task, at the same time as exposing free-riders. One of the benefits to teaching and learning of this approach is shifting the focus from measuring the final outcome of a task towards supporting the learning process.

Managing communications and networking in Ning (Tam Nguyen, Faculty of the Built Environment)

A case study was conducted using a blended learning environment for design students, combining the face-to-face studio environment with an online social network to facilitate student publication, communication and autonomy. The study aimed to examine the use of a web-assisted model of assessment, interaction and publication as a mechanism for measuring the effectiveness of inclusive design learning when supported by the constructs of social interaction.

The face-to-face studio environment is typical of most practice-based forms of design education. Tutorial groups are based around small groups of students in a problem-solving setting led by individual studio tutors. Studio activities involve presentations and discussions, aimed at facilitating common understandings of design limits and possibilities, and develop into individual consultations, aimed at refining design ideas. One of the key challenges with this format is the time required to complete an activity with a student and the teacher-centric nature of class management. Students often spend long periods of solitary time, waiting for their allocated consultation with their tutor.

Ning, an online social network service, was introduced to encourage more student interaction and publication. The *Ning* site was designed for visual appeal and social presence. Social presence here is defined as the "degree of salience of the other person in the interaction and the consequent salience of the interpersonal relationships" (Jusoff & Khodabandelou, 2009). It is also seen as the ability of learners to project themselves socially and affectively into a community of inquiry (Rourke, Anderson, Garrison, & Archer, 2001). Social presence is a complicated construct and involves privacy, social relationships, communication styles, the nature of the task, feedback, and immediacy (Tu, 2002), and can have a significant impact on student progression, improved learning, motivation and engagement (Jusoff & Khodabandelou, 2009; Richardson & Swan, 2003). The *Ning* site was centred around an 'activity feature' on the front page, which contained a stream of up-to-the-minute activity within the site. Students could immediately see and interact with tutors' comments, developmental work in student blogs, course discussions and announcements. They could also establish their own relationships with peers, at varying levels of intimacy. The social presence of the site produced intense communication between students and staff, ranging from social chats to critical review of work. Tutor feedback was driven by student initiative, shifting the responsibility of learning to the student. Feedback from both students and staff indicated the value of the social network to their sense of identity and belonging to a community of learners. It is clear that this social media technology is able to enhance identity formation and collaboration, promoting better sharing, inclusion and enjoyment of course activities. Online social interaction can greatly enrich engagement for both student and staff, encouraging a more creative approach to learning and teaching.

Independent learning in Facebook (Kate Coleman, College of Fine Arts)

Is creativity in the execution or the thinking that encourages participation online?

The act of creativity in this teaching instance was establishing a social media collaborative site to extend student discussion from the end of the lecture to the tutorial and back to the lecture in a learning loop. For a teacher who is an avid user of social media and has a strong philosophy in utilising the best technologies for student learning and community, *Facebook* offered a space to develop this community, to also encourage creative thought and ultimately creativity in community. The creativity that encouraged the students was the act of participating in an ever-changing discussion that continued to grow and develop. This group of students is in the creative industries, and students who graduate and seek employment in this field require good networking, strong communication skills and the ability to self promote (Bridgstock, 2005). With this in mind, *Facebook* was selected to be the predominant social community space alongside the LMS, *Moodle*, for lecture summaries, slides and recordings and a micro blog, *TodaysMeet*, for student commentary in lectures.

Utilising social media in face-to-face teaching doesn't require changing the course design, its function is to engage the students in the act of developing and sharing learning content and resources. Use of these tools for social and creative learning also encouraged a growth in digital literacy among these students, who developed a practice of sharing *YouTube* links related to lectures, including links to exhibition openings, student run projects and assessment topic discussion. Student posts were content- and course-related, supportive of assessment and driven by student need. Creating a student-owned page outside the LMS allowed for creative freedom in writing, sharing, reflecting and publishing of content related and course related material. To promote student ownership of the activity, students could nominate as co-administrators so that they too could manage requests and add students to the group, making enrolment easier and quicker.

Positive outcomes included increased interaction between students and peers, students and lecturer, and students and tutors, which led to development of a learning community with shared resources. An unexpected but important outcome was that students contextualised their learning in relationship to other courses in the degree programs, as they began quite early in the semester posting queries regarding other courses, asking for advice on assessment from other course components and chatting generally about their learning in the program. In this way students developed a way of working informally in *Facebook* in the context of their learning.

Conclusion

In these instances of course activities utilising social media, teachers were asked to retrospectively consider aspects of the teaching or learning that they consider to be 'creative'. For teaching, creativity was seen to be inherent in:

- taking a creative approach to designing the learning activity and learning environment
- being creative in their role as a teacher by both providing and participating in social communications
- becoming familiar with the social media tools that facilitate this approach through personal use and experimentation.

For students, creativity was promoted by expectations that they:

- collaborate and contribute a range of media inputs
- publish and reflect on instances of their own creative output, and give feedback to others
- participate in a community of learning where they are expected to contribute course resources.

Creativity requires a propensity to take risks, and a preparedness to fail, but this is not generally supported in the current university environment. The kinds of activities described here provide a moderated environment for students to practice being more creative in activities and communications. However, their propensity to take risks is dependent upon how these activities will be assessed. The potential of these technologies to promote formative assessment, and assessment of process rather than product is helpful, as is the opportunity for students to develop their own abilities for self and peer assessment. These kinds of activities also require risk-taking on the part of the teacher - to be prepared to assume a role as co-learner, and to experiment with technologies that do not have the institutional imprimatur. To achieve the potential for learning for the future offered by new and emerging technologies, institutions must support such experimental practice.

LMS Encounters: Promises and Realities – (e)Learning for Sustainable Futures?

Reem Al-Mahmood
Academic Language and Learning Unit/ Faculty of Science, Technology & Engineering
Curriculum Learning & Teaching Centre
La Trobe University

Although there are radical opportunities afforded by e-learning technologies (Hemmi, Bayne & Land, 2009), digital Learning Management Systems (LMSs) can be risky and "disorienting spaces" for participants (Bayne & Ross, 2007) even though they often replicate traditional rituals and forms of university bricks and mortar teaching spaces. Whilst we need e-platform standards, we also need flexibility and diversity to avoid replicating sameness in LMS design and implementation. In any educational platform selection, there are always risks and uncertainties, but if we embrace informed, sustainable and ecological design, we can evolve beyond purely market-driven agendas towards pedagogical designs that have a "learning-centric university mission" (Ellis & Goodyear, 2010, p. 153). This paper juxtaposes LMS discourses *in theory* with participant LMS experiences *in practice*. Emergent tensions of *(hyper)textualising* the university are discussed with/against neoliberal agendas of the (dis)embodied individual. At the forefront of our research agendas, we need to move beyond espoused e-learning technology promises to consider participant realities to inform (e)learning designs and choices, whilst experimenting with how to create sustainable learning/knowledge spaces for sustainable (e)learning futures.

Keywords: LMS, VLE, digital spaces, sustainable spaces, learning design, affect, subjectivities, identities, Actor-Network Theory, Non-Representational Theory, e-learning, e-teaching

If universities are to sustain and renew their digital spaces and presences then new (e)learning cultures necessitate "cultivating the imagination" in "a world of constant change" (Thomas & Seely-Brown, 2011). As early as 2002, Salmon (2002) advocated that universities explore "creative possibilities" rather than relying on "forecasting the future" through various scenarios to consider their desired (e)learning and (e)teaching possibilities. She outlined four scenarios to envision potential digital futures ranging from 1) "Contenteous" which relied on transfer and transmission models, 2) "Instantia" which involved actual e-learning, 3) "Nomadict" which involved mobile learning where physical campuses do not matter much and learners are mobile across institutions and cultures, to 4) "Cafélattia" where u-learning ('u' is for universal) proliferates through learning communities that extend globally beyond the walls of an academy. In u-learning, the "(clicks and mortar) are of key importance" (Salmon, 2002). The learning social context is paramount, and learners find "… like-minded individuals anywhere (e.g. by gender, by interest group, by profession)". Here the e-moderators can "… think globally but are able to turn their thinking into local commitment. They see the technologies as yet another teaching and learning environment rather than as tools" (Salmon, 2002). Wherever universities might be in terms of these scenarios, and whatever the extent of their (e)learning delivery, institutional digital spaces are essential for sustaining current university (e)learning and (e)teaching practices.

Currently, Learning Management Systems (LMSs), also known as Virtual Learning Environments (VLSs), or Course Management Systems (CMSs) are *the rock* of a university's (e)teaching and (e)learning enterprise. How these are used depends on whether they are viewed as tools or as environments (spaces), which is "a matter of perspective rather than something inherent in the tool/space itself" (Ellis & Goodyear, 2010, p. 139). I consider LMSs to be both spaces and tools, depending on their relationship with other entities. Whilst a proliferation of various university physical spaces abound, there are comparatively fewer variations in the digital learning platforms used – the Learning Management Systems. We need to consider the sustainable ecologies of LMS platforms. Whilst there are many LMS promises and challenges, Ellis and Goodyear (2010, p. 188, original emphasis) highlight that:

> It takes time for researchers to make sense of new pedagogies and the affordances of each new technology. It takes more time to produce useful sources of guidance and to disseminate them effectively. But it is rarely possible to put innovation 'on hold' while experts or enthusiasts try to sort out optimal strategies. Instead, university leaders must work with the ecology of learning that a good university needs to be. This means promoting the healthy functioning of the ecology, but also relying on it to adjust to new challenges.

In part, what LMS platforms help sustain are the discourses of the enterprising university (Marginson & Considine, 2000) in a neoliberal managerial bureaucratic sense (Davies, 2005; Davies & Bansel, 2007) of universities becoming organisational business structures with entrepreneurial autonomy, intensified work conditions and a culture of surveillance. Learning *Management* Systems imply that learning is *managed*. In the entrepreneurial bid to develop and benchmark e-courses for global access, curriculum becomes a modularised commodity (more so unintentionally). Yet, "It is ironic that most universities are using a medium that enables endless travel to construct learning within the confines of a module or course" (Cousin, 2005, p. 127). LMSs support a neoliberal agenda that placates critical scholarly resistance by virtue of 'access' to everything to a 'consumer' of everything. "By offering electronic users the appearance of a world controlled from their keyboard, a world in which everything can be 'accessed' and everything can be had, as in fairy tales, by a simple tap of the finger, multinational companies have ensured that, on the one hand, users will not protest against being turned into consumers ..." (Manguel, 2008, p. 227, original emphasis). How then will universities and their e-courses distinguish themselves in standardised LMS platforms to maintain their individuality?

The aim of this paper is to juxtapose LMS discourses *in theory* with participant LMS experiences *in practice*. Emergent tensions of *(hyper)textualising* the university (because of the LMSs) are discussed with/against neoliberal agendas of the (dis)embodied individual. The term 'text' in this paper refers to digital text used via the LMSs. Typed text still dominates within LMS use and discussion forums. (At the time of data collection there was limited use of multimedia texts due to bandwidth and LMS limitations. Todays enriched ease of multimedia embedding within LMSs given bandwidth improvements and updated LMS versions would alter potentially alter user experiences no doubt, but it is not the focus of the texts used in this study.) By using a sociomaterial lens of Actor-Network Theory (ANT) (Fenwick, 2010; Fenwick & Edwards, 2010; Latour, 2005; Law, 2004;) and an affective lens via Non-Representational Theory (NRT) (Thrift, 2008) to focus up material, spatial and affective considerations, the aim is to highlight learning from participant realities to inform learning design and choices of digital platforms of the future. Far from technological determinism, where technology determines society, or social determinism, where humans configure technology, I favour a relational sociomaterial perspective of socio-technical emergence – where technology and society co-shape the other and are more complex and unpredictable. I move to argue that the LMS is multiple *affectively charged spaces* (Navaro-Yashin, 2009) in practice — *The LMS Multiple* — drawing on Mol's (2002) notion that an object is performed through multiple enactments that emerge in various sociomaterial practices.

I first contrast the *LMS in theory* to highlight the discourses surrounding selection issues made by universities and then move to the *LMS enactments in practice*. I conclude by discussing emergent tensions of *(hyper)textualising* the university with/against neoliberal agendas of the (dis)embodied individual.

The LMS In Theory

Universities have to make digital platform choices guided by their educational, IT and visionary leaders. Whilst there are choices to be made between open source and commercial products (e.g. WebCT versus Moodle, etc.), there are many shared commonalities in LMS formats and styles that replicate notions of the 'traditional academy'. Even based on LMS names (e.g. *Moodle*, *Sakai*, *WebCT* and so on), one is uncertain of any major distinguishing or differentiating feature amongst them. However, more recently new such as *Desire2Learn* promises to be "more than just an LMS"[1] with a more student-centred approach that integrates diverse technologies. Nonetheless, most LMS products have tended to replicate 'traditional academic' delivery formats of the lecture. Far from being transformative, one can ask to what extent are LMSs contributing to any major "paradigm shift in teaching and learning" in adhering to traditional delivery formats (Cousin, 2005, p. 124)? In the mantras of e-learning and e-teaching innovation, standardised traditional face-to-face practices underpin much of e-teaching and e-leaning LMS platforms. The ambivalences surrounding traditional formats of the lecture, tutorial and exam as a pedagogical technique to stimulate student learning have been questioned (Laurillard, 2002; Phillips, 2005; van den Eynde, Newcombe & Steel, 2007, p. 1041). Sheely (2006, p. 769) argues that lectures have been placed as a central discourse of the academy and its educational activities, such that lecturing is aligned to teaching, so that moving teaching online for many lecturers involves moving lectures online. He echoes Phillips (2005) who is concerned by this persistent dissonance. Sheely (2006, pp. 772-773) suggests that not only do we need to talk about (and question) the technology we are moving to but the technology we are moving from — the lecture. Whilst many LMS platforms promise innovations and transformations in learning, these are based too often on replicating traditional formats of the academy online.

[1] http://www.desire2learn.com/

So how might universities select from LMS platforms? EDUCAUSE's (2011) "LMS evaluation" initiative recommends asking questions of the LMS in terms of: 1) What is it? 2) How does it work? 3) Who's doing it? 4) Why is it significant? 5) What are the downsides? 6) Where is it going? And 7) What are the implications for teaching and learning? Whilst the issue of pedagogy is placed last and more pragmatic and instrumentalist issues are raised first, further LMS viability consideration issues are suggested by Childs, Korkusca and Swartz (2009) and Katsifli (2010) to:

1) Start from a basis of teaching and learning principles, rather than financial cost prioritization.
2) Consider project management phases: Initiation ~ Consultation ~ Evaluation~ Selection ~ Transition ~ Implementation.
3) Develop a campus/university strategy: e.g. Teaching and Learning, IT, etc.
4) Decide between open source and commercial LMS products. Consider:
    a. Support-end (cost, quality, availability, transition, long-term quality investment)
    b. Stability and reliability for end-users
    c. Licenses (Free versus commercial motivations)
    d. Transition (transferring context online is a demanding and time consuming effort)
    e. Decision choice (5-10 year time-scale)
    f. Investment in human capital
    g. Innovation directions (Hierarchical versus distributed models)
    h. Expectation management (be attuned to campus staff concerns, outsourcings versus in-house)
    i. Risks (What risks can you take? What are the systemic pressures and software's ecology?)
    j. Stakeholders (consult all stakeholders, especially students)
    k. Security (critical mass, back-office vs. front-office help, ease of code fixing, vulnerabilities, critical mass, cost of security updates …)
    l. The product life cycle (LMS lifetime/shelf-life and how long to wait to recycle it, open source versus commercial permanence and viability)
    m. Exit strategies (what costs are there if you need to make a change, lock in issues, maturity upgrades…).

Choices are complicated in that the answer to which LMS to choose and its future longevity depends on the context and the future an educational organisation envisages for its (e)teaching and (e)learning. An academic community may be more likely to support an open source LMS more readily as it moves towards open scholarly communities, open universities, and open source journals. Whilst LMSs may wither as we move towards cloud and wave computing and new emergent environments in the future, within the next 5-years, the investment in LMSs will remain. Who and what informs their design, purchase, implementation, and use are vital actors in the e-pedagogies that emerge and are made possible (or not).

Consequently, we need to consider espoused (explicit and implicit) LMS configuration designs and pedagogical underpinnings (e.g. student-centred, learning-centred, collaborative, flexible, accessible) versus actual participant, desires, uses and practices. Hannon (2009, p. 423) highlights the need to explore the transformations that are enacted in practice "and their effects on the participants of online learning" which "tend to be less prominent in large-scale discussions" (Hannon, 2009, p. 423). Whilst some studies have dealt with some of these aspects (Al-Mahmood, 2006, 2008a, 2008b), Coates (2005, p. 68) has advocated detailed analysis of LMS engagement styles given that "… almost every institution has invested in an LMS as a means of leveraging the Internet to enhance some kind of competitive advantage. The challenge that institutions now face is not technological or financial, but educational. Institutions need to identify how to maximise the return on their investments by using LMSs to manage the quality of university education." For as he says, "our understanding of the influence of LMSs on student engagement remains in its infancy" (Coates 2005, p. 66). Higher education e-learning and e-teaching are still "works in progress" and "in flux" (Poster, 2001).We need to consider sustainable and ecological designs (Ellis & Goodyear 2010) in our choices and understand these new emergent learning environments more — these "learnplaces" (Goodyear, 2008). It is in this vein that I move to consider what occurs *in e-learning practice* from participant perspectives to understand these LMS spaces beyond instrumental and fiscal organisational concerns to inform (e)pedagogy.

The Study

This qualitative study involved a multi-sited ethnography (Leander & McKim, 2003; Marcus, 1998) of four fully online postgraduate subjects in an Australian university. Ethnography was chosen to facilitate prolonged and immersive exploration of participant e-learning and e-teaching engagements. Physical ethnography (Marcus, 1998) and virtual ethnography (Hine, 2000, 2005) were used to gather and observe the minutiae of participants' everyday practices across physical and digital spaces. Participants were invited to participate in the study, and methods to deal with physical and digital (im)mobilities were used (Büscher & Urry, 2009; Büscher, Urry & Witchger, 2011; Sheller & Urry, 2006) to capture various actors across physical and digital spaces. These methods included participant interviews, participant observation, photographic data, and participant reflections across physical and digital spaces over a period of 6-10 months, as well as document analyses. This facilitated qualitative validity via triangulation from multiple data sources. Triangulation is "a validity procedure where researchers search for convergence among multiple and different sources of information to form themes or categories in a study" (Creswell & Miller, 2000, p. 126). Data were collected from 24 participants — 19 online postgraduate learners, and 5 teaching staff (2 females and 3 males) ranging in age and teaching experiences. Daily scheduled observation diaries of the online subject sites were recorded, and participants were invited to record their reflections and provide images of their various learning spaces. A wealth of detailed data were amassed. Whilst the aim was to add to the world through ANT and NRT lenses, glimpses into human, spatial, discursive and artefact interactions were 'traced' (Markaskuite, 2011, p. 244), whilst attempting to 'capture' and '(re)present' the sensuous and affective dispositions and spatial ambiences.

THE LMS In Practice

The three enactments and discussion that follow include participant segments based on detailed thematic analysis of face-to-face in-depth interviews/conversations (each ranging from 1.5-2 hours each) and participant reflections. These fragment selections highlight spatial subjectivities rendered with/against current neoliberal climates. Through these enactments, screening practices and the effects of textual LMS thresholds, their politics, and limits to subjectivities are illustrated. What emerges are the configurations of censoring and censored selves in the (im)mutable LMS spaces in the three enactments that follow titled *tracing*, *labouring*, and *viewing*.

Enactment 1 — Tracing

- **Visibility — "There are consequences!"**
  "… you need to lay down some foundations that people have an understanding, particularly when it's written … that there are consequences of the written word … sometimes people don't realise the harshness of an online interaction and that it stays sitting there on the web (laughter) to be revisited and revisited …. as opposed to a comment that can pass and then be forgotten …"
  (Bernie, lecturer, with recent experience in e-teaching and digital technologies)

- **Riskiness — "Putting your head on the chopping block!"**
  "… there's still that sort of reticence to put your identity or reveal too much about yourself … it's a requirement of the interaction to put stuff out there and some people even put their photographs on. I didn't do that … and … sometimes, in some ways, I felt like a little girl … because you're putting this stuff out there, you're actually almost putting your head on the chopping block …"
  (Peta, student with extensive experience as a face-to-face lecturer and online lecturer in her professional life but new to being an online student)

- **Permanency — "It's there forever!"**
  "… being an online student is a bit more threatening than being face-to-face … because everything you're doing is … written. If you are online, you say something, no one's going to forget. When it's online, it's there forever! It's recorded! So if you don't understand something, like your stupidity is there for the whole online community …"
  (Sandy, student who experienced strong negative aspects of online learning)

- **Masking — "Revealing a part of yourself in time"**
  "… if I was sitting up at one o'clock at night and I wanted to send my email, I didn't ... because I didn't want the lecturer to think I was some weirdo person sitting up at one o'clock at night (laughter) …. Maybe it's because it's the one part of learning online where you actually reveal a part of yourself … outside of academia. It's yoohoo, I sit up at two or it's five o'clock in the morning …"
  (Natalie, student who loves the newness of the online learning medium and sees it as an adventure and novelty despite the uncertainty of not having done any prior online study)

- **Photographs online — "I put up a photo of my office…"**
  "… getting back to photos on the Internet, a couple of years ago, because there's a lecturer's page, and I did have on my lecturer's page … photographs, and then I took them off because I read a paper about why on earth would you ever put your photograph on the web, because it can be taken by anybody, it can be

manipulated. You could be starring in a porn movie because you innocently put your photograph up. … it's actually a security measure so I decided to take photos off … I put up a photo of my office to make it a bit more personal …"
(Peta, student with extensive experience as a face-to-face lecturer and online lecturer in her professional life but new to being an online student)

- **Censorship, surveillance, and codes of practice — "… everything is traceable…"**
"… the subject content was fairly innocuous so it wasn't as if I had to reveal a personal political view or have a debate ... Had it been that … I would've been extremely uncomfortable in the current climate to say much at all … as everything is traceable …. I suppose I'd have to say that I'd probably censor what I'd say! What's really absent is a code of ethics, of rights and obligations for how students" and lecturers" online content is going to be treated and stored … so far I've never seen anyone address this issue openly or in a policy sense or even raise awareness of it …"
(Miranda, student who has had extensive experience teaching in blended university environments who is enrolled as a student online for the first time and other online digital environments are a strong feature of her daily interactions)

- **Transparency and accountability — "… you can track me down"**
"… and you can track me down, you can see how I respond to you, you can see from the dates. It goes 13th, 20th, 27th, absolutely to the week. Because it all started in one of the earlier years where there was this cry there was no support, and the Dean, I don't know, there was some letter that went to the Dean and he came to me and said, "What's been going on?", and luckily I kept all the email log and I was able to furnish him with all the contact and of course he then said, he laughed and said, „Well, she [the student] doesn't have a leg to stand on here, but I have."
(Sam, lecturer, who is a highly and extensively experienced and engaging face-to-face lecturer who has taught online for some years but sees the online LMS as not providing the same richness of face-to-face teaching)

- **Private and public intersections — "Can you imagine…"**
"Can you imagine if some classmates recognise you in the street and say, "Koko you are a student in the [x] course". You'd be terribly shocked, and your privacy would be a little bit invaded … just like if you … put your picture on a very famous Yahoo website …"
(Koko, student, who is a 21 year-old international Chinese student who is digitally savvy and views the university technologies being used as old and antiquated)

The LMS space and its permanence, visibility, and longevity raise significant complex traceability and surveillance issues for students and lecturers (Bennett & Regan, 2004). For the four online subject content of this study, the content was fairly innocuous, there were no major political ramifications or viewpoint *voicings* about *political* issues required. Participants though still alluded to censoring their content, destroying the myth of anonymous, democratic online spaces. Jones (2005: 105) emphasises just "how little anonymity the internet *actually* provides to its users". The panopticon (Foucault, 1979, 1988) of constant (self)surveillance (Poster, 1996, 2001a, 2001b) is even more applicable *online* (Land & Bayne, 2005b). Ironically, LMS tracking facilities were originally designed to assist lecturers to monitor and understand their students' learning (Phillips, 2006). Whilst lecturers benefit from being able to improve their online courses through continual evaluation (Goldberg, 2000 cited in Land & Bayne, 2005b, pp. 165 & 166), there is rarely *disclosure* to students. Poster (1996) refers to *virtuality* as a "superpanoptican" because of the detailed possibilities of surveillance. Land and Bayne (2005b, p. 171, original emphasis) remind us:

> … not to underestimate the extent to which this power to constitute and disperse subjects can be applied in virtual learning environments. Whilst humanist ways of knowing might resist the idea that identity formation can take place outside the skin of the individual, we need to consider the possibility that the online student may be starkly objectified in her virtual construction, that 'the learner' may be, as far as our systems are concerned, to some extent constituted by records of her first login, last login, frequency of login, number of discussion board submissions, pattern of page visitation across the site, and so on. Such an identity might exist not only beyond the control of the individual learner, but its very existence — and possibility of 'judgement' being applied to it either wittingly or not — might remain unknown to them.

This may well be the case with the rise of web analytics and its uses to analyse behaviour patterns. Philips at al. (2011) have shown the limitations of using quantitative web analytics and the need to include rich qualitative data to extend understanding of how participants learn and use LMS environments. There are significant ramifications that arise regarding public and private online personas (Burbules, 2000, 2002, 2006a, 2006b; Conole & Dyke, 2004; Dawson, 2006). Yet detailed archiving, visibility, and permanency can provide transparency that puts lecturers' teaching *out there* providing evidence against student complaints. However, the roles and privileges remain unequal for both sides. In LMS design configurations, "There is an unequal power relationship between the seer and the seen — the visibility of the seen enables the seer to 'know' them, to alter them. Access to this knowledge, to this power, is of course unevenly distributed" (Land & Bayne, 2005b, p. 168).

Enactment 2 — Labouring

Here, I address human/machine/material thresholds regarding how students and lecturers *labour* in using the LMS. We see online textual translations of selves as *laboured* and *labouring*, not assuaged by the apparently considered responses of their lecturers in these cases.

- **Glued to the machine!**
  "I had a love hate relationship with my machine, because I was entranced by the online world, I was glued to the screen, my mouse and keyboard, the tension in my shoulders, arms and neck was excruciating, not to mention the long hours just sitting there with glazed eyes. I keep thinking I have to move away from it and get out and hug some trees (laughter)!"
  (Miranda, student who has had extensive experience teaching in blended university environments who is enrolled as a student online for the first time and other online digital environments are a strong feature of her day-today interactions)

- **Online forum as "glorified email"!**
  "It was a glorified email. That's all it was!"
  (Sandy, student with strong negative experiences of the online learning spaces)

- **Talking to a machine!**
  "I was talking to myself" and "I told you, I felt like I was talking to my computer!"
  (Sandy, student with strong negative experiences of the online learning spaces)

- **Consumed by email deluge!**
  "..There might be hundreds of unread messages… and it's quite interesting… I just don't bother, it's just, already your life is consumed with the instant email that comes through …"
  (Meg, who has extensive experience teaching face-to-face and has returned to study online for the first time)

The human-machine configurations are further complicated by bodily challenges of screen reading and subject LMS platforms, as Meg, says:

> … he [lecturer] posted [via hard copy] the first three weeks of readings, which is good; I appreciated that. Then I had to brace myself that I was going to have to access the rest of it online, and I can download, and once I've downloaded stuff then … it's straightforward reading. I'm fine with being just a lone student, engaging with paper and print. I don't like reading on the screen for a great length of time, because in terms of reading stuff, I want to highlight it, scribble notes in the margin, make connections and links …

Online reading is further aggravated beyond the screen issues by being confined to a chair, desk, and laptop for some students. Meg highlights, "you're confined to your chair and to your desk and to this laptop for so many hours in a day". Ergonomics (Goodyear, 2000, 2005) is a pertinent issue for students and lecturers — seldom discussed. Indeed, how will ever smaller gadgets impact on physical well-being? Participant accounts attest to the density, volume, screen reading, and printing required online. Far from being paperless offices and studies, hard-copy rescue missions are required to sustain students, as Peta highlights, "I always print out the notes …. I haven't fully adapted to the technology in that I still like a print-out as well. It's a bit hard to read on your computer in bed at night, but you can flick through your notes". Sam also highlights that text is tiring for lecturers, saying, "... I find it tiring to type.… I never send anything out because I've always got to reread it and make sure it's correct and makes sense … if you're a lecturer at university, you've got to come out as somebody who knows something".

Sam’s further frustration is with the inadequacy of online text to reveal her embodied self as a lecturer, saying: “… it can’t convey me very well”. She elaborates: “Yes, well actually I think … online, I’m fairly boring. I respond, I try to raise it [online interactions] a bit, but it’s nothing like my face-to-face where you can have a joke and where I do a lot more. You can see I talk a lot but as I don’t write a lot, I feel it can’t convey me very well down in writing”. Yet, for Barrie (lecturer), who loves the online medium and sees it as efficient, saying, “I just bang out a reply back!” to students, highlights:

> … We’ve got a rule, if they send me an email, if I haven’t got time to read it, I just bang a reply back, “Got it!” That takes two seconds …. That’s not a bad system of doing it … it’s very quick … you say: “How’re you doing? Haven’t seen you for a while”. That’s it, it takes 30 seconds …. but I’ve been lucky — my class size has always been about 20 or so.

Yet, the online screen and textual manifestations of self can be a source of anxiety. Sandy (student) who had experienced the online space as highly limiting points to LMS postings being like “glorified email” and like *talking to herself*, highlighting her palpable concerns in feeling quite alone, asking: “Is anyone out there?”. She points to the intimidation she feels by another student’s textual persona. Clearly, digital textual footprints can (im)press *loudly*!

> … there was someone who intimidated me completely. … she was so professional … she probably did 10 of these things [online courses] already. Everything she did was so like a text book. I was like, “Oh my gosh”. I thought people were supposed to be new to this subject. This person was writing as if she had probably [completed] 500 already … Any attempt that you made at anything, you saw her response and you thought: “Oh my gosh, forget mine”. … So you see people’s depth of how they respond or how short they respond. …. It’s like you’ve got to be that daring or confident person who is going to be the first person to respond. Like you break the water and everyone else sort of follows after that.

Yet the online textual medium can be democratising, as Brian (lecturer who has extensive experience of teaching face-to-face and is most engaging, as well as experience teaching online) suggests, conceding though that “language difficulties will come through”, that the medium is:

> … probably the democratisation of education in … that you aren’t prejudiced … you don’t necessarily colour the feedback you give according to whether the person is older than you, younger than you, extremely senior, less experienced, from another country. None of those things are immediately transparent.

Typing, clicking and sending in the e-learning medium changes the sense of engagement. Despite its efficiency, it creates a feel of commercialism. Here, we witness realities of efficiency coupled with realities of commercialisation abutting each other as Lillian (a softly spoken and poetic Chinese student who majored in English literature in China and hence is aware of English language textual nuances) highlights:

> I think that makes it more efficient …. The teacher can go out and leave and do his own business, but still he can teach and I’m also, I mean, efficient at doing this, and I type out and didn’t go to the classroom and sit in [for] three hours. Okay more efficient. But also I think that makes peoples’ interaction and communication less and less and so makes you feel other things are more commercial…

In summary, these *screening* enactments highlight e-learning and e-teaching materialities and thresholds. LMS environments are complex multiple actor-networks. Online space can be seen as providing a fluid space in LMS forum postings, where students and lecturers respond (or not) to postings. The LMS screen configures users, and the postings act as mediators. Postings to the LMS are permanent, visible to all, and stable; yet they are also deemed fluid by participants as the can be moved, archived, and screened by potential unknown others any time. The various LMS posting features from tone, font, timing, and so on, simultaneously (dis)connect participants — whilst (dis)enrolling some and not others. Hence, LMS postings censure and/or extend some participants to configure more censured, anxious, or fragile subjectivities online. The LMS is *multiple* and not singular — it can take on “different forms, different performances, different realities, that co-exist in the present” (Mol, 1999, p. 79). Different relationalities and materialities lead to different threshold *screenings.*

Next, I move to a final enactment to consider how the LMS platform is *viewed* aesthetically, an area too often neglected in terms of the affective consequences.

Enactment 3 — Viewing

- **LMS Aesthetics**
  "Well the two courses that I've done online at Cyberia [de-identified] university both had the same look about them. Cyberia Uni uses, what do they use [x, LMS de-identified] system and they're identical in format. Visually unexciting I suppose you would have to say, and as I said, I feel that they are just there simply to have notes online. There's nothing more. There's no third dimension to it. …"
  (Peta, student with extensive experience as a face-to-face lecturer and online lecturer in her professional life but new to being an online student)

- **Flatness of text!**
  "I found after a while of reading all the posts and the emails, I really started to want to see someone's personality in some way through the text. I grew sick of the flatness of the text, everyone having the same default font of the LMS, the same colour, the same font …. of course you could get a sense of people's tone through words and their subtle nuances, but I started to get really bored by the flatness of the text, its physical flatness! It would've been so good to have had people come to life more through font choices maybe … just to alleviate the monotonous **flatness** …"
  (Miranda, student who has had extensive experience teaching in blended university environments who is enrolled as a student online for the first time and other online digital environments are a strong feature of her day-today interactions)

  "…. but I started to get really bored by the flatness of the text, its physical flatness!"
  (Miranda, student who has had extensive experience teaching in blended university environments who is enrolled as a student online for the first time and other online digital environments are a strong feature of her day-today interactions)

- **LMS design look and feel affecting *"the classroom"* feel!**
  "It [the LMS] looks too boring and dull. The colour and all the things — the colour is so ugly. … it can be like Yahoo and you can add some expressions and little icons …. Emoticons … emoticons or something like that and the colour can be more like, more beautiful. Why don't they ask some people who really learnt about art and about the design to design this beautifully? That [the subject LMS] makes the classroom ugly … So for me, my online classroom is that forum, and that classroom is ugly. So I just get inside — so, I just write down my answers — my tasks — in word processing — word processor, and after that I just copy and paste it to the classroom and send. So I only stay there for a few minutes. So I won't stay there for longer. … I think make it more — just more beautiful."
  (Lillian, a softly spoken and poetic Chinese student who majored in English literature in China and hence is aware of English language textual nuances)

  "It [the LMS] was just a bit dull."
  (Sandy, student with strong negative experiences of the online learning spaces)

What I have highlighted in this section are glimpses into LMS engagement issues *in practice* to show multiplicities, complexities, and materialities, as well as configurations of/by various actors. Whatever the limitations, universities need to consider the emotional and affective aspects of LMS engagement and "visual ergonomics" regarding the "look and feel", the fonts (Danet 2001), as well as "intuitive navigation and iconic signalling" preferred by participants — too often ignored by multimedia designers (Flood 2004, online). Bayne (2008a) also invites consideration of the impact of visuality of LMS spaces and suggests that higher education online is a visual practice.

The LMS Multiple

In practice, LMS encounters and spaces are much more complex, unruly, and unpredictable. In some instances, the LMS is a fluid object/space with less tangible and more fluid boundaries where university LMS subject borders are stretched to wider global Internet resources. The LMS was also perceived and used multiply from a "fantastic" connecting global knowledge space to a space of "deluge" and caution — for some, digital spaces are potentially disruptive and unruly places that threaten to drown them with information exceeding the limits of information manageability. The LMS can be viewed as a fluid ambivalent and changeable object with multiple identities and enactments. The LMS as a fluid technology (De Laet & Mol, 2000) has its boundaries enacted in various configurations. For one participant, the LMS may be a life-saving space, and for another, an ugly and bounded space; and yet for another, an enticing space; and for another, a disorienting space, and so on. The

LMS might be better viewed then as a boundary object (Star & Griesemer, 1989, p. 387) performing differently in different worlds (Star 1995, p. 12), or a fractional object that performs itself as one entity in "irreducibly different ways in different circumstances" (Law 2002, 2004). Implicit throughout these enactments are the varied effects of LMS spaces. At times, they act as boundary objects (Star & Griesemer, 1989) providing thresholds for crossing through, from, to, into, and beyond — opening up possibilities. Their (dis)locations vary according to their status across various networks.

Our subjectivities are configured by our digital spaces, as much as we attempt to configure them (Woolgar, 1991a, 1991b). For example, our configurations by Google and the production of knowledge are extraordinary, and there are implications for neuroplasticity changes (Brabazon, 2007) in how we think/act in digital worlds. Digital spaces can seduce, entice, command attention, and become "space invaders"; yet they too can be deserted and abandoned in favour of new technologies. LMSs command our spaces/places as they too change or stagnate and age. Current LMSs, however, remain predominantly, entrenched in textual practices, bringing with it, the *(hyper)textualisation* of universities with further ramifications in current neoliberal university climates.

(Hyper)textualising The University

Whilst one could argue that much of the traditional university has been textualised through books, notes, etc., in the online medium everything and everyone is *hyper*textualised. We become mediated through e-text through infinite computer screen wordings. Through the textual typeface, we become infinitely worded — digitally *(hyper)textualised*. In moving the university online through digital textual inscriptions, digital academe becomes simultaneously (de)stabilised in various ways in its boundaries, aesthetics, longevity, and yearnings.

The LMS hypertextualises (e-)learning and (e-)teaching. These provide boundaries that are productive and secure for some, yet limiting and intolerable for others. For example, the bounded space of the subject LMS and the inability to go beyond the university's LMS boundaries facilitate a sense of safety in containing, limiting, and gate-keeping information/knowledge flows for some students. Knowledge here is regionalised, and students are not overwhelmed by massive information — tolerance boundaries and thresholds are controlled. Boundaries can help enclose and secure participants from the big WWW, and shield them from information overload — hence, pragmatic and practical selves (and roles) emerge productively in *(hyper)textualised* e-learning worlds. Here, boundaries and limits enable do-able e-learning.

In terms of the textual limiting aspects (intolerances), the LMS already configures users by virtue of its design and aesthetics (or lack of). For some, lack of aesthetic appeal and user-choice limit participants' contributions and exposure to the subject's LMS. So we see the yearners, yearning for things to be otherwise. The look and feel of the LMS (in its "clunkiness" and "ugliness") only serves to highlight the LMS as a commercialised educational product, devoid of any "personal touch" (human touch). For some, this cannot equate to the quality of engagement with a lecturer in the flesh. Human yearnings (in the flesh) are not only echoed by students, but also by some lecturers, who would have "face-to-face any day". So we have not only disenchanted and disillusioned selves, but also enduring selves — as participants find ways to resist, endure, and survive e-learning and e-teaching challenges.

In these accounts, the LMS in its look and feel, its limitations, its erasures, its standardised spaces, its flatness and its lack of a "3rd dimension" in the words of one participant, make e-learning and e-teaching a limiting experience. The LMS configures and is configuring of how participants engage (or not) in e-learning and e-teaching.

Further, bodies are configured and restricted to be "glued to the screen" as one student put it. As our bodies traverse the boundaries of work, home, and digital academe, ergonomic and EHS (Environment Health and Safety) issues spread across various locales. There are few policies that place limits on student numbers or the additional hours required for e-delivery. In Sam's (lecturer) case, her department made no distinction in her workload between her enrolled e-students and face-to-face students; rather, these two groups were enrolled in the same subject code. Hence the invisible additional e-work required of her, remained just that — invisible! Bodies, however, need care and demand attention! Whilst universities tend to address EHS issues in their physical university spaces, they tend to be remiss in addressing them for e-teaching and e-learning across other locales.

In online LMS (hyper)textualisation, there is a significant concern with the longevity and visibility of participant textual contributions — these risky spaces of the LMS are potentially "there forever". This leads to censured selves and further self-censoring and extra editing work. The LMS platform configures the learning spaces as potentially risky, where participants' vulnerabilities are visible and remain permanently online, for example, when Sandy suggests that one's "stupidity is there for the whole online community" to see, or when a student may not respond because of the time visibility of their contributions and possible judgements placed on them. The configuration is towards self-censured responses and contributions due to the visibility and permanency of the online text. What are the effects of the residues and traces of selves, knowledge and materials left behind online? What digital imprints and traces do we leave in the e-academy in our digital archived selves?

These imprints raise digital anxieties regarding digital fingerprints. Indeed, the extent to which online media are "democratic" and "freeing" is contestable. I would like to think that "all identities are fictional to any degree, and all points of departure are available" (Cousin, 2005, p. 127), but are they? I have alluded to LMS tracking facilities and their intended uses and archiving concerns for academic selves, views, and curricula. McShane (2006) refers to the tensions of the archived academic. Archiving of online textual interactions can have multiple ramifications, although this may seem fairly innocuous, but in the digital age where there are visible traces of political, moral and substantive viewpoints, there can be serious consequences. Yet, beyond the "petrified selves of audit" (Stronach et al., 2002, p. 121), for Sam (lecturer), the archived online interactions provided evidence of her diligence and responsiveness against a student's dissatisfaction complaint. Archiving and visibility are ambivalent spaces and practices. There are serious educational issues regarding archival permanence (Land & Bayne, 2005b, p. 172). Burge (2007) passionately discusses significant issues regarding students' rights to privacy and confidentiality versus an institution's right to data capture. She asks "burning" questions about a lecturer's material becoming available online, and what public access could do, from fears of plagiarism to peer critique. She also asks if it is appropriate or fair to subject the online classroom to "scrutiny at a higher standard than we would a ground-based classroom" (Burge 2008b, online; Burge 2008a). In 2007, Campbell and Oblinger (2007) rated security as a number two concern in e-learning and e-teaching, and in 2008 Allison and DeBlois (2008) found that security was the number one issue of concern. Further, a number of ethical concerns are raised in the literature about the e-academy and online education (Anderson & Simpson 2007; Demiray & Sharma, 2009; Haughey 2007; Hinman, 2005; Spinello, 2006; Tavani, 2007).

Perhaps surprisingly, the greatest limitation of (hyper)textualisation for some e-learners was yearning for the lecturer in the flesh as the body is 'lost in translation' online. The LMS with its access and flexibility simply can never make the mark — yielding nostalgic selves, yearning selves, grieving, and mourning selves. What becomes of embodied educators and their skills as they become a "hybrid subject shaped by other networks and flows in which they are enfolded" (Edwards & Usher, 2008, p. 92)? For Dreyfus (2009), e-learning and e-teaching can never approximate the presence of a lecturer in the flesh; e-learning can only ever be an approximation or a loss and can only ever produce competence — which can never equate to the engagement in the flesh in a scholarly community. e-Learning for Dreyfus (and for some participants) is forever tenuous and remains untenable — ever in a comparative state with *what it is not* rather than with *what it is* and *might or could be*.

Whilst the (in)visibility of the flesh is a cause for grief for some, there are other losses in invisibilities via *hypertextualisation*. Sky (an international student new to the online medium) highlighted how the LMS textual medium placed her Canadian nationality under erasure as it became difficult to glean from the typed English screen text. She also mentioned that many of the Australian idioms were not easily transparent or understandable, saying, "just because we speak the same words doesn't mean that they have the same meaning" — highlighting that just because we 'speak' (write) English, doesn't mean we 'speak' (write) *the same* English. This is significant for international students, although textually some aspects of the non-native speaking of English may be more transparent via text. Here we have a national identity erased to a large degree by virtue of the medium. Yet for others, this *hypertextualisation* is a welcome opportunity for the individualised one-to-one email interactions between the lecturer and the student, where there is an increased and heightened sense of lecturer presence.

So with what consequences do we translate ourselves digitally across geographical borders — with what erasures, with what (in)visibilities? We need to find ways to imbue e-learning and e-teaching LMS platforms with more embodied richness to allow for diversity.

I have shown that there are multiple ramifications of *(hyper)textualising* the university online. The strength of qualitative studies and their contextualisation contribution is to add depth and richness to understanding LMS use *in practice* based on actual participant practices to help understand what might lead to sustainable digital spaces in (e)learning platform evolutions.

(e)Learning for sustainable futures?

Regardless of the élan of digital learning technologies, whatever our LMS and digital platform selections, we will need to know how to use and transform knowledge to consider what constitutes desirable designs for e-learning and e-teaching? Oblinger and Hawkins (2006) suggest that the question, "Does technology make a difference?" depends on how we ask the question — for *what* and for *whom* and in *what way*. They point to the added flexibility, affordances and also to moving beyond replicating our existing teaching practices to consider *redesigning what we do*. "Are we doing the same things with technology, or are we taking advantage of the unique capabilities of technology and redesigning our activities?" (Oblinger & Hawkins, 2006: 15). *LMS-ing* of knowledge can make e-teaching and e-learning (*inadvertently*) much more *teacher-centred* than the intended and purported *student-centred* or *learning-centred* LMS designs. How might we work with/against these tensions?

Further, with increasing conceptualisations of education as a commercial enterprise (Marginson & Considine, 2000) and knowledges as mass commodities, what will it mean to teach in a *borderless* university — at what cost, to whom, and for whom? In the enterprising e-university, we see students, lecturers, and the academy (by virtue of its buy-in to LMS companies) as consumers, so knowledge readily becomes a commodity. Enterprising in a commercial sense is not always experienced positively, despite the implied e-learning flexibility and access, because here the pedagogical student-teacher relationship becomes one of facilitator-customer/client.

Whilst these "less familiar and less stable environments" (Hannon, 2009, p. 428) of LMSs could provide new pedagogies and paradigm shifts (McLoughlin & Lee, 2008), we need to explore how to move beyond the textual drowning and linear restrictions of LMS standardised designs. How do we imbue aesthetics of educational design — for aesthetics matter (Udsen & Jørgensen, 2005)? There are marketing and policy implications for what a university looks like via its LMS platform, what it exudes, how universally accessible it is, and how immersive it is — as well as its spatial atmospheres. How can we create LMSs with multiple places for students to explore and mingle beyond the linearly ordered and the academic — where social spaces (e.g. digital university cafés, digital noticeboards) might co-exist alongside the serendipitous, surprising, and unexpected?

A more encompassing and ecological approach might involve embracing a "learning-centric university mission" (Ellis & Goodyear, 2010, p. 153). Despite the radical opportunities afforded by these technologies (Hemmi, Bayne & Land, 2009), they are risky and "disorienting spaces" for students and lecturers (Bayne & Ross, 2007). How might we create multiple LMS platforms designed and individualised to consider diverse learning and teaching styles, pedagogies, curriculum, and preferences? In commercialised LMS platforms, uniformity and standardisations of formalised traditional academe dominate. Whilst we need standards, we also need flexibilities so we do not merely replicate sameness, but embrace, innovations, diversities, and differences. We need counter-narratives beyond the studies by large multinational digital knowledge companies that have a vested interest in presenting their products enthusiastically; rather, we might seriously consider student expectations from LMSs and their e-lecturers (Steel 2007) to inform design. We need to experiment with how to create sustainable learning/knowledge spaces, keeping these issues alive on our research agendas (Ellis & Goodyear, 2010; Riddle & Howell, 2008). These are questions and issues I raise for system and policy planners, e-learning and e-teaching designers, and education practitioners. We need to *renegotiate* — in all sorts of ways and with all sorts of *things such as the LMSs* — how we go about learning and living. In any educational planning, there is always uncertainty (Ellis & Goodyear 2010: 106), but if we have at our base a willingness towards sustainable and ecological design then we can find ways to explore and evolve beyond purely market-driven technologies towards innovative pedagogical designs that have at their heart user-choice, universal accessibility, and flexibility. To consider our possible (e)learning futures, we need to take heed ultimately, of what Agre (1999, p. 39) points out that "Our choice is not technology versus no technology, but a wider determination of the concepts and the values that higher education should embody".

Over a decade of promising pedagogical models and technology for music teaching: Can the past still reliably guide the future?

Alan Anderson
Centre for Teaching and Learning
University of Newcastle, Australia

Research papers reporting the potential of new technologies and pedagogical models have a tendency to mushroom as educators disseminate the results of promising pilot studies. Some ideas and technologies gain traction and prove sustainable while others are superseded or fall by the way side in search of the next best thing. As a first step towards examining the sustainability of new models and technology for music teaching, this concise paper compares relevant themes in a selection of current publications with those in past publications around the turn of the millennium. In so doing, this paper also considers the ASCILITE 2012 "premise that what happened in the past is no longer a reliable guide to the future."

Keywords: music technology, teaching, higher education, models

Introduction

In spite of some early teething problems, the Internet along with advances in digital music technology has empowered teachers, producers and consumers of music in ways that were virtually unimaginable several decades ago (Lipshitz, 2005). The capability to preview and purchase music online is clearly a benefit to consumers. For musicians and students of music, especially those working at the grass roots level, modern home studio technology enables essentially 'do it yourself' production of higher quality recordings than were possible using the typical four-track analogue tape recording machines of the previous generation. In addition, the Internet can be used for accessing professional mastering studios, distribution services, and for promotion and professional networking via social media.

The unforeseen impact of such changes would seem to support the ASCILITE 2012 premise that "what happened in the past is no longer a reliable guide to the future." On the other hand, a broader historical perspective offered by Laurillard (2005) is also worth considering. Comparing new media and delivery technologies for information processing (1970s - 2000s) with their functional equivalents for reading and writing, and in turn with information and communication technologies developed throughout history, Laurillard suggests:

> "The development in information and communication technologies over the last three decades is comparable with the development in information and communication technologies over the last three millennia" (2005, p.8).

Continuing on to discuss the learning support function of recent developments, Laurillard concedes, "it is difficult to represent the importance of computer-mediated conferencing, for example, as there is really no clear historical equivalent to enabling large group discussion across huge distances (ibid)."

Moving music education online

In the 1990s through to the early 2000s, many education research papers focused on the feasibility of online teaching and learning. Technical constraints and related concerns about equity of access were topical, as a significant proportion of the population did not own a computer with an Internet connection. The quest for appropriate pedagogical models also featured prominently as it does today.

As high-speed broadband access improved across institutions and households, the potential of streaming multimedia for instructional purposes captured the imagination of early adopter music teachers. Instructional videos of serviceable quality could now be produced and distributed via the Internet using 'plug n play' web cam technology that required little, if any, training to operate (Karlsen, 2002; Anderson & Ellis, 2002). In addition, desktop videoconferencing via web cam offered possibilities for synchronous tuition one-on-one or in small groups, although latency has continued to impose some constraints to the present day in spite of faster connections and readily accessible software such as Skype. Large room-based videoconference systems were also being trialed by a number of universities and conservatoriums around the world (Maki, 2001; Eberle, 2003). Subsequent studies investigated how to effectively blend the use of these corporate room-based videoconference and Learning Management Systems with applications that individual teachers could use to create and distribute content with from their personal computer.

All the abovementioned technological developments were part of the Information Communications Technology (ICT) landscape by 2000, however, in practice web resources were commonly treated as supplementary rather than integral to course design (Webster, 2011). Learning Management Systems (LMS) have often been used in a similar fashion, although some teachers began to investigate the possibilities of making LMS environments more central to student learning of musical instruments through the integration of replayable media such as MIDI files, music notation files and video recordings of music teachers, students and guest lecturers demonstrating performance technique (Anderson & Fitzgerald, 2007). More recent developments in Web 2.0 social media and mobile learning applications are making it even easier for music educators to design courses with student-generated multimedia content and collaborative group work in mind. To that end, some of the earlier studies outlining instructional strategies for multimedia-assisted teaching and learning can still be useful to inform the development of new pedagogical models and practices. The same could be said of computer laptop orchestras that began around a decade ago yet foreshadowed the kind of collaborative networked music making and educational opportunities that could well be taken for granted today.

Past assertions and models reiterated

Towards determining whether lessons learned from the previous decade can reliably inform the future, an online library catalogue search for relevant journal articles was conducted using the keywords: music technology, music teaching and higher education. Closer inspection of a sample revealed that many claims reiterated what had been said in past journal and conference publications. In table 1, the first column shows author-date referenced assertions or models proposed in recent publications; the second column shows past publications that raised the same or similar issues, models or predictions about tapping the potential of new technology.

Theoretical models based on research into improvisational cognition (Sarath, 1996).

Summary

As a first step to assessing the sustainability of new models and technology for music teaching, themes in a sample of recent music education and music technology publications were compared with themes in turn of the millennium publications. Upon closer examination many of the recent publications reiterated or expanded on assertions made in the earlier publications. For example, calls for improved access to high quality music tuition were evident in a number of successive government reports. The potential of videoconferencing technology was reiterated in relation to music teaching and higher education in general. Calls for teachers to consider new ICT-enhanced pedagogical approaches were also repeated.

The expansion of social media hosting user-generated content (Webster, 2011) stands out as a disruptive yet positive change providing new opportunities for collaborative music making and learning. Efforts to ascertain the sustainability of this phenomenon, however, must surely take into account its influence on how other technologies are used. For example, in regard to laptop computer orchestras, recent advances in digital audio and mobile social media connectivity are helping to bridge practice and conceptual gaps between the traditionally specialist domain of the computer music composer and that of the music enthusiast in the broader community. Similarly, the rise of e-mastering services has empowered grass roots musicians and music students by giving them unprecedented speed of access to professional mastering studios around the world.

The notion that such developments were largely unforeseen by most bodes well for the ASCILITE 2012 premise that "what happened in the past is no longer a reliable guide to the future." However, assessing future sustainability remains - as Laurillard notes in regard to computer-mediated conferencing - "difficult to represent … as there is really no clear historical equivalent … (2008, p. 8)." Perhaps more reliably based on past history is the fact that significant advances in technology have often taken the world by storm, largely unforeseen by the masses. This view suggests there is still much to be learned from the past, especially concerning the way that people have historically learned to exploit initially disruptive technological innovations.

Humanizing e-lecturers and engaging online writing students via dialogic video

Martin Andrew
College of Education
Victoria University, Melbourne

This paper reports on a study of integrating instructor-produced video 'profcasts' (Edirisingha, Salmon & Fothergill, 2007) into all 12 units of an online Master of Arts in Writing delivered asynchronously. While the value of short, targeted, quickly-made podcasts and extensive streamed video lectures in educational contexts has been researched (Williams, Birch & Hancock, 2012), few studies consider how customized videocasts supplement and complement core content to create engaging units of learning that learners value. Instead of producing instructivist, sage-on-stage, reiterative lectures, the Writing team filmed lecturers in semi-spontaneous dialogues to create critically challenging interactive experiences. The teaching and learning challenge is deeper than humanizing e-lecturers; it is about creating sustainable interfaces drawing on unique human capital: the lecturers as future-makers. It is a journey of creating enduring and impactful resources. Foregrounded by a literature review, this paper presents qualitative data from students and staff responding to the question of how valuable dialogic videos are to students' experiences as online students of Writing. In addition to confirming students appreciate the humanizing of lecturers, data shows video makes ideas more accessible to visual learners and more engaging overall. Most importantly, informal dialogues with their exchanges of ideas clarify written course materials, supporting learning while helping to future-proof the program in a time of change.

Keywords: Audiovisual materials; Education; online teaching and learning; Writing

Introduction: The need for audiovisual dialogues

In an age where technology must constantly respond to change, e-educators play a major role in delivering, maintaining and sequencing authentic, engaging and reusable learning objects within cohesive pedagogical frameworks (Juweh, 2006). The conception of online learning environments as comprising a motivating array of dynamic multimedia resources has effectively led to a new culture of learning. Within this culture, e-learners potentially face nearly unlimited resources and multiple possibilities for interconnectivity (Thomas & Brown, 2011). This culture provides 'environments that are bounded yet provide complete freedom of action within those boundaries' (Thomas & Brown, 2011, p.18). Absent, though, are opportunities for imagining the lecturer as either a cohesive pedagogical presence or a thinking human being. As Fowler and Mayes argued in 1999, *who* learners learn from is crucial in constructivist environments mediated by technology.

Educationalists in disciplines such as Writing strive to create sustainable learning environments within their disciplines; but at the same time the investment learners have in developing their identities as writers depends on trust (Andrew & Arnold, 2011). Writing learners need to develop trust in their peers and tutor, and this involves getting to know them. This paper proposes an effective way to get to know the tutors while creating authentic, engaging and reusable learning objects: Dialogic 'profcasts' (Edirisingha, Salmon & Fothergill, 2007). These exemplify the role of innovation in online teaching and learning in the discipline of Writing, and highlight the need for the human in the Humanities. Whatever the discipline, educationalists need to be aware of their roles as future-makers: creating reusable resources that continnnue to engage target learners. To cite Diana Laurillard's (2002) comment on teachers as future-makers in a world where univeristies need to future-proof themselves: 'as the new technology requires, as the knowledge industry requires, and as students demand — then it follows that academics must become researchers in teaching' (p.22).

This paper reports a case study focusing on integrating customized, pedagogical audiovisuals into an online Master of Arts in Writing delivered asynchronously at Swinburne University. Foregrounded by an investigation into previous studies of using audio-videos, podcasts and profcasts to enhance learning and a description of the project, this paper presents qualitative data from 26 students and 8 staff responding to the question of the value of customized profcasts to their learning experience. The study is similar in nature to that of Stodel, Thompson and MacDonald (2006), who discovered that the elements of F2F learning online students miss most are the robustness of online dialogue, spontaneity and improvisation, perceiving and being perceived, getting to know others, and learning to learn online. This study hypothesizes that informal dialogues with their exchanges of ideas model robust online dialogue, offer natural spontaneity and provide a visual image of teaching presence where learners can ‘perceive’ their teachers, getting to know them in the process. This study investigates how such interventions support the learning that characterizes a Writing program.

Both research into online learning in asynchronous modalities and our own student evaluations indicate that a key challenge lies in learners’ perception of the e-lecturer as *faceless* (Flecksenstein, 2005; Stodel et al., 2006). Hence, the teaching team decided to incorporate audiovisual representations of lecturers enacting their knowledge and being themselves as learning objects. In addition to introducing faces – and voices and body language – the team wanted to portray the personalities of all teaching staff, both lecturers and tutors. The team followed the hypothesis that content is more engaging when it is delivered by personalities rather than figures. As practitioner-researchers, team members built their hunch by reflecting on the use of audiovisual dialogues to build perspectives in ‘real world’ creative enterprises: The addition of ‘extras’, particularly interviews with personnel, to the media of DVD and Blu-Ray adds value to the experience of those experiencing the art form. Similarly, the interviews with artists in the Metropolitan Opera’s High Density (HD) cinema series (http://www.metoperafamily.org/metopera/liveinhd/LiveinHD.aspx) adds exegetical value to the experience of viewers. ’Exegetical value’ can be understood thus: learning about being involved in creative enterprise from insiders’ perspectives produces an intertextuality that elucidates both the creation itself and the act of creation. In Writing, this, to return to Laurrilard (2002) and Stodel et al. (2006), is what students demand.

At the program level, the team aimed to create dynamic learning objects to motivate and provoke students through the incorporation of the human into the electronic. At an institutional level the challenge is deeper than merely proving lecturers are not, as several students commented, ‘cyberbots’; it’s about creating more future-proofed and sustainable learning interfaces drawing on unique human capital. This capital comprises the teaching staff themselves. It’s the personalities that make the materials unique and different from other institutions’ products. Instead of producing streamed talking-head lectures replicating lecture material in a sage-on-stage manner, the team decided to have lecturers and tutors in dialogic conversation to create a more socially constructivist, more challenging, interactive televisual experience for students.

This paper plays into a discernible research gap around non-reiterative customized audiovisual production for online delivery, particularly in the postgraduate levels in Writing. ‘Non-reiterative’ refers to materials that do not replicate the materials of ‘the lecture; or ‘the text’, but which are spontaneously co-constructed dialogically by specialists in the field. Few studies in the wake of Edirisingha, Salmon and Fothergill’s ‘profcasts’ (2007) have, however, considered how audiovisual materials designed for asynchronous use can be used to supplement and complement core lecture material to create more a more engaging and sustainable learning interface.

Background: The project

Swinburne University, allied with Open Universities Australia (OUA), has delivered its 12-unit online MA in Writing since 2002. Since that time many other institutions have produced their own, often competing, online Writing programs. The original iteration of the program used HTML lectures together with mostly static, lecturer-led monologues paraphrasing these lectures. These are delivered via the Learning Management System (LMS) Blackboard. Several lectures contained interviews, where lecturers captured writers in the workplaces and created stretches of authentic, two-way, situated dialogue. These, but not the talking heads, were well regarded in student evaluations of units.

In 2009 it was the institution’s and the discipline’s challenge to create unique pedagogical features to individuate its product, future-proofing the program and competitive advantages and migrating from the lecturer-unfriendly Dreamweaver to ‘easy-to-use’ Contribute (http://www.adobe.com/au/products/contribute.html). As part of a *carpe diem* project involving lecturers, information technology specialists and librarians, the goal was to draw on lecturers’ potential as effective future-makers and update the suite incorporating insights from research and experience. We knew more about online praxis, how learners construct knowledge and what media are most effective in creating multi-dynamic weekly modules scaffolded into 12-week sequences of learning according to constructivist patterns. We began with an audit of our assets.

The Writing discipline’s most identifiable assets are its staff - published, industry-based teaching and writing professionals – and ‘how they get their acts together’, their ‘Discourses’ and ‘ways of being’. The terms ‘how people get their acts together’. ‘Discourses’ and ‘ways of being’ come from literacy scholar James P. Gee (1990), who argues that effective learning occurs most readily in situated contexts, within authentic environments. It happens among real identities being themselves; that is, using naturally the big-D Discourse of their discourse community or community of practice. For Gee, ‘Discourses’ are:

> Ways of behaving, interacting, valuing, thinking, believing, speaking, and often reading and writing, that are accepted as instantiations of particular identities by specific groups … They are 'ways of being' in the world. (Gee, 1990, pp. 2, 161)

The goal in the Writing program was to create authentic audiovisual materials featuring the university's unique teaching staff using their 'Discourses' naturally, as we observed in the well-evaluated early interviews. It is about 'ways of being'; about making Discourses accessible. In the logistically simpler audio-podcasting championed by Salmon and Erdirisingha (2008), the human voice has power. Situated literacies theory enables us to argue for the pedagogical power of the contextualized ('situated') whole person over that of the faceless voice. Further, Sian Bayne (2004) suggested 'embodying' the lecturer adds value to online learning. As analysis of the views of one student in Bayne's study of embodiment in cyberspace suggests, 'the body of the teacher … becomes a locus for the aspirations of the learner' (p.111).

In representing the teaching staff as embodied, this study draws on Bourdieu's (1977) understanding of thought and discipline knowledge as embedded in embodied practices. The spontaneous nature of the spoken word profcasts allows writer-lecturers to access and project what Gee would consider their 'ways of being' or what to Bourdieu are their living practices, sensibilities, modes of speech, manners and tastes. In the process, the team marks itself as belonging to a particular social group, that of the Writing discipline. The lecturer identities the profcasts convey aligns with Bourdieu's concept of the *habitus,* marking the writer-teachers as representatives of the social order of Writing. In the eyes of students, this builds trust and credibility.

In a study of possible relations between text lectures and audio or audiovisual postcasts, McGarr (2009) identified three relations: *substitutional, supplementary* and *creative.* In the findings of the study, the first of these is ineffective while the second and third can affect active learning. Accordingly, the Writing team wanted the profcasts to work as *supplements* or *complements* to the canonical 'printed' lectures produced by the specialist lecturer in each module. The nature of the relation between written lecture and audiovisual supplement/complement is crucial since Copley (2007) valorised 'supplementary' audio and visual podcasts for on-campus students. We define 'supplements' as working alongside the lecture, bringing in additional perspectives, examples and materials, while 'complements' offer a contrasting or alternative interrogative position, effectively deconstructing the canonical nature of 'the lecture'. Clearly, the goal is to create more balanced, engaging and critically challenging technology-generated materials. They not only appeal to a wide range of learning orientations, but they also increase accessibility and flexibility since the audiovisuals can be downloaded as either video or sound files and played on portable mobile devices.

In analysing the role of conversation in constructivist learning, Allen (2005) wrote: 'One of our greatest learning and teaching tools within higher education is language. By this we mean genuine dialogue not monologue' (p.253). Similarly, the team chose to use dialogues rather than monologues to capture a more engaging and interactive audiovisual pedagogical sequence involving natural, yet organized, conversational turn-taking. The dialogues can reflect a range of dynamics:

Peer-on-peer: A balanced two-way conversation, discussion or debate with equal turn-taking on a key topic.
Interviewer-to-expert: In cases where a specialist or industry-based guest lecturer participates, they are given more talking time through the use of targeted interviewer cues with a lecturer.
Member-to-apprentice: Sessional tutors who have been students are interviewed for lecture 1 in the sequences of 12 to clarify aspects of the unit's key assignments. This brings a voice closer to that of the students and better targets their potential concerns. This also affords sessional tutors visibility and positions them as important identities and voices in the pedagogical team. Students can relate to sessional who, like themselves, are positioned as apprentices to a desired community of enquiry.
Platonic symposium: The Platonic dialogue, where lecturers take on expert but sometimes dogmatic and controversial positions (for instance about the role and value of critical theory for writers) is a valuable pedagogical device because it involves the use of devil's advocacy and the creation of multiple positions. Its goal is to emulate, anticipate and give voice to the range of objections and contrasting opinions students may have. Introductions to these dialogues contextualize what follows so students clearly understand that lecturers are representing positions that may not be their own.
Panel discussion: Two 'experts' are interviewed in relation to particular cues relevant to the unit.

Not only do the voices vary, countering the boredom that may come with listening to monologues, but there is also room for multiple perspectives. The dialogues are based on cues negotiated in advance by the two participants so that broad subject areas and trajectories of discussion are agreed. The performances, however, are unrehearsed, spontaneous and authentic: 'They are 'ways of being" in the world' (Gee, 1990, p.161). The semi-scripted nature of the enterprise allows for interesting opportunistic digressions while keeping the timing of the interviews controlled: the target length is 12 minutes, a length designed to avoid both outstaying its welcome and being mistaken for a lecture substitute.

From 2009 to 2012, the recordings were variously made in a once-camera blue-screen studio or a two-camera television studio and required the help of a technician or technicians who operated the camera(s) and organized postproduction. The more expensive two-camera set-up allowed for close-ups to be interspersed with long-shorts for dynamic variation, while the one-camera set-up is static, requiring more dynamism and movement from the lecturers. Postproduction involves editing, the superimposition of a suitable backdrop and the interspacing of introductory sequences, captions and inter-titles and leads to a quality branded product. The Writing discipline remodeled the units between 2009 and 2012 and needed to evaluate the usefulness of these pedagogical innovations. Informed in general by action research's reflective learning cycles, the researcher sought evaluative responses from two stakeholder groups: students and tutors. The question asked was open: 'How valuable are the videos in the Writing discipline's delivery of its Writing subjects?'

Literature review

Koumi (2006) surveyed the potential of video as an e-learning tool under three key categories: *assisting cognitive learning and skills development; providing experiences unavailable through other media* and *nurturing feelings and motivations.* This drew attention to the potential of video resources. Valorizing discussion-embedded video lectures, Haga (2002) argued 'watching a video enables learners to study as if they were participating in traditional classroom' (p.120). Athey (2010, online) suggested video infuses asynchronous e-Learning with human interaction and visual demonstrations that can be lost outside of live instruction. Berner and Adams (2003) noted that while adding video to audioslides is 'expensive' it also 'personalizes' learning (p.190) particularly where lecturers are more expressive. In one rare study of bespoke audiovisuals, Tantrarungroj (2011) demonstrated the capacity of learning interfaces utilising streaming video to improve learning performance in neuroscience by improving retention of content knowledge.

The majority of relevant studies on podcasting investigate practice-based applications within specific learning environments. Larkin (2010) concluded that audio podcasts represent 'an opportunity to add value to existing teaching and educational strategies' (p.247). Usefully, the study challenges online teachers to ensure that lectures not merely used to convey information but 'to support the transformative nature of real learning' (p.248). Copley (2007) reported positive student evaluations of AV podcasts, while Lonn and Teasley (2009) found little evidence they help teaching. Lazzari (2009) and Demetriadis and Pombortsis (2007) see minor impact on grades when students are lectured via AV lectures. In a medical radiation program, Scutter, Stupans, Sawyer and King (2010) found podcasts were reported to improve students' learning, partly because of their ability to be replayed at leisure, even though this learning may be of a passive and superficial variety. For them podcasts were substitutional – 'the uploading of lectures onto the subject website' (p.180). It is unsurprising the researchers remain unconvinced about the value of podcasts for teaching deep and abstract concepts but enthusiastic about their intermittent value to clarify key points. Demetriadis and Pombortsis (2007), too, stress their usefulness in knowledge acquisition, but not knowledge construction. Peden and Domask (2011) showed 'there is little evidence regarding the relationship between podcasts and student engagement' (p.175) and a lack of compelling evidence that they impact student learning outcomes.

The value and applicability of podcasting with MP3s in distance learning is clear in research-based studies of the 'podogogical' use of podcasts to improve reflective capacity, promote dialogue and maximise the transference of skills (Salmon & Erdirisingha, 2008), amongst other things. These studies show teaching using podcasting can impact student learning by:

> supporting organizational aspects of learning; developing positive attitudes towards the lecturer, bringing in an informality and fun to formal learning; helping with independent learning; enabling deep engagement with learning material; providing access while being mobile (Edirisingha, Salmon & Fothergill, 2007, p.134).

Two of their findings are the themes *Sense of informality in learning* and *Deeper engagement with learning material and a deeper understanding.* Lee and Chan's (2007) discovered podcasts can help decrease feelings of isolation and increase sense of community. The enthusiastic work of teaching practitioners like Guertin (2010) suggest a wide range of creative possibilities for activity-based and task-based learning using podcasts in weekly discussions, opening the door to creating community. Broadly, any discipline can create and use profcasts to target their units' learning outcomes, and create effective tools for review. There are clear guidelines about their instructional design and they can use video (Edirisingha, Salmon & Fothergill, 2007; Salmon, Erdirisingha, Mobbs, Mobbs & Dennett, 2008). In a multimedia communication program, Lazarri (2008) concluded the use of podcasting 'in an appropriate and challenging educational context can influence the quality of the learning experience and help students achieve good results' (p.33).

The use of web-based learning technologies (WBLT) such as Lectopia has produced many studies, most dealing with face-to-face (F2F) versus flexible/ blended deliveries. Most report little difference in efficiency. Demestriadis and Pombortsis (2007) suggest recordings made with WBLT could be valuable in online and blended deliveries, but recommend 'thematically-focused, short e-lectures that need not be regularly updated' (p.148). Like Demestriadis and Pombortsis, Brechy & Ogilby (2008) argue that so long as they match student learning styles, e-lectures are beneficial, being course-related, replayable, flexible and portable. Bennett and Maniar (2008) warn videoed lectures make learning unengaging and hinder independent learning. Bennett, Maniar, Clark and King (2008) report supplementary podcasts in on-campus programs add value for students.

Little of the research, Williams, Birch and Hancock (2012), write, tells us more than that students like them (for their time-flexibility and replay-ability) but that they can lack engagement and prevent the lecturer's personality from shining through. Many argue their mere existence mitigates against lecture attendance, but, like Larkin (2010), emphasise that perceiving the use of WBLT as a *substitut*e is counter-intuitive. Harnessing its potential as a non-reiterative *supplement* or *complement,* as this study of audiovisual profcasts does, is more the point. It's about deepening the learning experience and increasing engagement through multimedia. Williams et al. (2012) conclude that students using recordings as a substitute are less successful than those viewing them as a complement. This insight is useful in application to designing units for online delivery: the meaningful relation of other material placed beside 'the lecture' needs to be clear.

Methodology

This study reports on the evaluation stage of an action research project inestigating the value of an innovation – dialogic profcasts – in response to a key problem in the teaching and learning environment: the need to future proof the Writing program while integrating lecturers' 'lived Discourses' into our learning environment. In action research, reflecting on experience involves problematising and meta-thinking and is a crucial source of authentic data in teachers' lives leading to theories for practice (Burns, 2010). These practices accord with Little's (2012) description of action research: 'as teachers continue to teach, implement new methods and resources, and reflect on the results, the goal is to improve student learning' (p.70). This action research uses a method characteristic of case studies. Case studies are detailed contextual analyses of a limited number of events or conditions and their relationships and relate to everyday experience. The study's main method is a single-event case study generating discourse involving 26 student and seven tutor responses to a directed cue.

Procedure

Twenty-six students and seven tutors voluntarily replied to a one-question email survey sent to 55 students enrolled in semester 1, 2012 and the entire cohort of 10 tutors. Respondents wrote freely, cued by the following question: 'How valuable are the videos in the Writing discipline's delivery of its Writing subjects?' All students and tutors gave permission to cite them anonymously. Accordingly, they are described as student 1-26 (S1-26) and tutor 1-7 (T1-7). In this methodology, counting responses as they emerge does not have statistical significance, but indicates to the researcher issues closest to the forefront of respondents' consciousness.

Data analysis and presentation

In isolating and presenting themes, the researcher uses the qualitative descriptive methodology Sandelowski (1995) employed in analysing naturalistic texts in nursing contexts. She described a method of closely reading material, identifying key storylines to understand everyday practices and underlining key phrases 'because they make some as yet inchoate sense' (p.73). This method draws on recognized qualitative word-based and scrutiny-based techniques of readerly observation, and has allegiances with thematic analysis and narrative enquiry. The findings are presented as themes and discussed in the light of issues raised in the literature review.

This is a small-scale project with a data set from tutors triangulating that of students and informed by the researcher's reflective observations as writer-teacher-researcher. It's an example of how teachers might be future-makers by applying to their own practice the analytic phases of *immersion, incubation, illumination, explication* and *creative synthesis* (Moustakas, 1994).

Because this research occurs in the context of creative arts, there is more awareness of the researchers' implicitness and agency, to echo Bakhtin (1990). I have created and appeared in more than 40 educational videos, and my educational philosophies, epistemological stances and understandings of ontology impact on the project. Concurring with Richardson (1994), I believe my researcher and lived selves as writer-educator are inseparable; indeed I have already impacted on the responses of my subjects due to the wording of my cue and my personal history of communications with my respondents and, as with all researchers, I am part of my data. Although the findings merely report the themes, the methodology used forces me to storify them.

Findings

Theme 1: 'Not cyberbots – real!'

The first theme groups together a range of ideas related to the benefits for students of seeing their tutors. T1 sums it up neatly:

> *One of the difficulties frequently discussed by online students is the facelessness of their encounters. The video not only puts a face to their tutors but also a personality, allowing students to see themselves as mentored by real people rather than faceless representatives of a dmbodied authority.*

S5 wrote with ironic tongue-in-cheek: *They were not cyberbots out there with automated course content. My tutors were real!* T6 reiterates the metaphor: *It's important for them to know we are not automatons!*. S17 adds: *There are humans on the other end of this course after all!*.

1.1 Know our tutors' personality
Students and tutors positively comment on videos' ability to personal the lecturer and the adjectives *real* and *personal* resound in the responses, along with the verbs *human* and *meet*. *I find it personally valuable to put faces and voices to the people on the other end of the lesson* (S14) is a typical response. 'It gives us a sense of character' writes S19. As T7 points out, *in a real tutorial, you'd see your tutor's expressions and hear his or her thoughts, and you'd gain insight into the person.* The profcasts personal materials and allow personalities with *mannerisms* (S18) to shine: *There's a sense of their becoming real people with personalities, while lectures tend to show them at their self-conscious scholarly best* (T7). In addition to creating more authentic communication channels, the videos also allow access to 'voice': *The video component allows us to 'know' our tutors and lecturers a little better – tone of voice is very helpful in 'hearing' their messages* (S1). Over and above the tone of voice and its inflexions is the paralinguistic communication: S4 appreciates the paralinguistic *hand gestures* used as underlining and T4 mentions the *warm dynamic* lecturers exhibit on screen using what S15 calls *spontaneous exchanges of information.*

1.2 The casual complements the formal
The spontaneous, informal nature of conversations and discussions is also viewed as a positive and the adjectives *more interesting* and *more engaging* appear with iterations of this theme. S14 gives a typical description: *The informal nature of the interviews makes the video content more accessible*. The fact that they are casual discussions not formal lectures is mentioned in 14 responses. The casual nature allows the staff to *drop their guard and their passions to show* (T7) allowing students to access *extra bits and pieces beyond the content of the written lecture notes* (S15) and providing an *extra dimension* (T5). S6 writes: *To have a more casual discussion…is also useful and provides a backup to what we have been reading about*. The casual videos support the formal lectures. *Sometimes the informal view just clarifies a point not quite understood in the written lectures.* They also *assign a human identity to the 'ruling authority' in the learning transaction* (T1), meaning that the informal humanity projected augments the formality of the knowledge embodied in lectures, turning them into approachable 'mentors'. T4 adds the videos students favour *show a bouncing backwards and forwards of ideas between interviewees rather than the formal question and answer style* and that students need explicitly to know that videos are a complement not a substitute. The data suggests students do understand the complementary relation: *The video lectures always cover extra areas to the written lectures and do complement them quite well* (S17) and *add analysis to the written material* (S20).

1.3 Reducing isolationism
S23 argues videos are *a step forwards – they reduce the isolation of online studies.* Along with 8 others, S21 shares her experience of aloneness: *As a long distance student, my study would otherw be conducted in solitude with only the printed word for company*. The 'otherw' indicates a contextual reference to the role of the videos in creating a human presence in the learning suite. *While flexibility is a plus,* S21 continues, the *isolation can be*

at times a negative. T3 adds, *the online learning environment can be an isolating experience for many and the video lectures go some way to address this issue.*

Theme 2: 'Unlocking' understanding

2.1. Use of different media solidifies learning
When S22 writes videos *create a variety and helps stimulate learning,* she is one of 12 articulating the idea that triangulating learning materials with different media is a key strategy. The video dialogues help to unlock understanding: *listening to these discussions clarifies and expounds aspects of the learning material* (S21). The metaphor comes from S3, who says *the videos…have been key to my understanding* and requests more. (S4 wants more too and suggests Skype, with S7 wanting *video link ups).* S6 writes the videos *helped transform* (subject name) *from an unknown beast into a comfortable friend* and that the type of articulation they convey *floors* her. S13 tells a similar story:

> *In the discourse … one or another of the two participants often reveal gems of ideas that motivate me and encourage me to become involved in the learning process in a way that would not be possible had I just read those same words on paper.*

2.2. Variations in dynamics aid engagement
The contrast in dynamics between the lectures and the videos is an important subtheme, with the videos validated for being more *personal* and *direct* and lectures called *bland. They provide a great starting place in understanding and engaging with the material in the lecture*, says S9, who supposedly chooses to watch the video before reading the lecture. *They are a stepping stone to the provided learning materials,* writes T2. *Videos are a worthwhile learning tool that complement the written material and, with technology…there are many possibilities for the future…films, poetry readings and even links to Youtube* (T2). T5 points out, *interviews are easier to digest than reading lectures.* S20 concurs: *Some days my head is full of written words already and audio adds another dimension.* S23 explains why: *Videos contribute to a more rich and diverse study experience.* S20 gives an example: *I like the interaction where* (lecturer) *paraphrased one of* (lecturer's) *questions. It clarified … the debate … I'm still coming to grips with many new concepts.*

2.3. Consolidating moments of serendipity
Video exchanges can crystall 'a-ha' moments. S14 writes, *I often pause the video and refer back to my notes and have the inevitable 'a-ha- moment.* T1 thinks that for some learning styles they better *encapsulate* key ideas. S10 describes changing her mind about her choices for the assignment as a result of one such spontaneous interchange and S11 reals what a *cop-out* she has been in avoiding journal writing as a research strategy. The scenarios described in the dialogues create stories and vignettes with which students can relate and project their own thinking. The fact that students often refer to the videos as resources in their weekly posts makes it clear to T2 that students really *connect to and engage with these videos-not only as a starter point for further discourse…but as a way to build connections with their tutors.*

Theme 3: Becoming part of the discussion

While videos cannot provide the same experience as being there, they can provide a simulacrum, making S9 feel *the same as we would if we were actually attending a university lecture in person*. S25 agrees: *It makes me feel I am attending a normal lecture…It gives me hope for the future of my own writing*. Feeling she is part of the discussion helps her to feel part of a future, imagined community of writing. S13 says *the videos allow me to feel we are on a journey of discovery together.* S2 finds the videos *amazing: I feel I can be part of the two-way discussions…It's more like a tutorial.* S2 goes on to speak of i*mmediacy* and *connectiveness* in contrast to autocue monologues. The 'inclusive' nature of the encounter is important for S21 and 10 others: *Watching the dynamic interchange between members of the staff is both insightful and effective.*

The visual nature of the material is the key here: *I believe that visual material contributes to a feeling of real life contact with the lecturers.* Ours is a visual age and, as S24 asserts, *we have a right as students to expect at the very least to have videos.* Three respondents state they are auditory learners, with S25 listening to the lectures *in the background* and finding it an effective way to learn.

Discussion

Using bespoke audiovisual dialogues involving teaching staff appears to have value as a teaching and learning innovation. As learning objects, they create a complementary and supplementary relation to formal lectures by using positive and casual interchanges. Their purpose and relation need to be explicit. They are ‘non-reiterative’ and not intended as pedagogical substitutes. They are a creative use of the medium, of the sort described in Guertin’s (2010) study of podcasts. They foregrounding the ‘Discourses’ of teachers as unique learning capital that learners value because it humanizes lecturers and provides provocation and clarification.

Audiovisuals involving interacting academics are a way of engaging learners by employing different dynamics from print e-lectures. They also incorporate socialisation by giving lecturers faces and personalities, creating for many a feeling of ‘being there’. This adds to the sense of social presence Stodel et al. (2006) identified as lacking in online learners’ experience. For some students, dialogic videos help reducing isolationism. This study supports Lee and Chan’s (2007) belief that podcasts help decrease feelings of isolation, specifically by showing lecturers are not cyberbots. While the study does not show they contribute to the increases sense of community Lee and Chan also saw, there is a clear sense that learners see podcasts’ potential to humanize the lecturers and bring the university tutorial room into the online environment as engaging and valuable. Together with dynamically used discussion forums and the ‘community of enquiry’ pedagogy Stodel et al (2006) describe, they can be part of a teaching and learning package that promotes community (Andrew & Armold, 2011). The fact that the profcasts are customized is testament both to the regard for students and to the program’s need to futureproof itself with a pedagogical variation on the unique selling proposition. There are, unsuprisingly, no comments on the futureproofing calue of the audiovisuals; only on their pedagogical value.

The study supports the claim that AV profcasts’ multiplicity, flexibility and portability appeal to many learners. They enable a crystallisation of learning for some and an ‘a-ha’ moment for others and this suggests a more than superficial or passive engagement of the kind Scutter et al. report (2010). There is no evidence that the bespoke profcasts are unengaging or that they hinder independent learning, charges laid against WBLT. Where research on podcasts might tend to suggest they, too, are unengaging and add insufficient value, the Writing discipline’s creation of dialogic profcasts suggests students are engaged and value their impact.

These media allow personalities to shine where it might be formalized or even appear haphazard in WBLT like Lectopia. Indeed, the findings concur with Edirisingha et al. (2007) and support two of the study’s findings - *Sense of informality in learning* and *Deeper engagement with learning material and a deeper understanding.* The profcasts’ tone of casualness and their participants’ ability to discuss and debate, throwing the ball from one to the other, appeals to learners and creates a learning intervention that complements and supplements and certainly cements knowledge conveyed in lectures. The findings suggest the embodiment of the teaching staff serves as the kind of aspirational spur Bayne (2004) identified.

Conclusions

The profcasts described in this project have a number of unique features which impact on their value. The fact that their relation to the lecture is supplementary or complementary, adding alternative or different views and voices, is a part of their effectiveness. This supports studies by McGarr (2009), Copley (2007) and Larkin (2010), preferring a supplementary relation between podcasts and lecture materials. As supplements or complements, their relation to the lecture needs to be clearly conveyed in the curricula. They are not substitutes, and research suggests pedagogical interventions conveying similar information in a similar way lack value (Larkin, 2010; Williams et al., 2012). Their length – up to 12 minutes – is a virtue, as is the fact that they are dialogues, simulating the dynamics of a lively collegiality. Their ability to bear an interrogative relation to the lecture provides a space for critical thinking and reflection. Their potential to present a range of identities and ‘ways of being’, at the same time embodying *habitus*, is valuable too since it codifies the teaching staff as members of the Writing community to which the learners aspire. It is a way of valorising sessional staff through presence and representing those who are apprentices to the community of practice of the Writing discipline.

An insight into the *habitus* of lecturers is an insight into that of practicing academic-writers and a mirror into the students' imagined communities and aspirational goals. In this way, the profcasts connect the here and now with the aspirational futures of learners. They effectively model Gee’s (1990) ‘ways of being’ by ‘situating’ the Discourse of lecturers in an accessible learning environment. For many of the writing students, getting to know the teaching staff via profcasts adds value to the online learning experience while providing materials that supplement and/or complement the written lectures. The authentic, embodied practices portrayed in the videocasts together with the 'ways of being' conveyed combine to create this engagement. As well as providing engagement, they mark the MA in Writing as unique and contribute to future-proofing.

The adoption of the *carpe diem* process for creating and rewriting online units signals a team approach where the lecturer, not the instructional designer, generates sequences of content and where representations of teacher identities are as central as those of students. This study corroborates the idea that teacher identities can be used as tools for engaging pedagogically with students. It is possible for teachers to create interchanges which are involving and inclusive and which will last over time: teachers as future-makers, contributing to pedagogic and resourcing sustainability.

To foreground and even commodify the teaching staff as bearers of disciplinary and institutional banners is to move a long way from the online learning worlds of 1997 when McWilliam and Taylor noticed the teacher's 'material presence in the learning context' was represented almost as an 'impediment to learning, a stumbling block in the path of access to information' (p.2). The new culture of technology-mediated constructivist learning using multimedia learning objects needs to celebrate the *who* and not just the *how.*

Distance learners’ use of non-institutional social media to augment and enhance their learning experience

Dr Trish Andrews
Teaching and Educational Development Institute
The University of Queensland

Professor Belinda Tynan
Global Learning
University of Southern Queensland

Ms Kendra Backstrom
SeE - Student e-Experience Project
The University of Adelaide

This paper reports on initial data elicited from two related studies which draw on the learner voice in relation to experiences of distance learners in their use of social media in higher education contexts across four universities. Data from these studies suggest that the wide availability, accessibility and affordances of social media create alternative learning options for some distance learners. The studies reported here draw upon affordance theory and identify that some distant learners are actively and deliberately using popular, non-institutional social media tools to augment and extend their learning experiences. This brief paper discusses emerging findings and the possible implications of these findings for the sector.

Keywords: Distance learners, social media, affordances, higher education

Introduction

Distance learning is a rapidly growing segment of the education market with more learners moving to online distance learning every year (Allen & Seaman, 2010). Online distance learners are those whose learning is delivered and mediated by technology and who have little or no face-to-face interaction with teachers or other students (Keegan, 2008). Social media is becoming a major form of communication, interaction and information access and generation for people globally and as Selwyn (2012) suggests, in recent years the wide-scale uptake of these tools ‘has transformed the ways in which the internet is experienced by most end users’ (p. 1). However, it remains that widespread benefits of web-based tools have largely failed to materialize for the majority of distance learners. The focus of much online learning is still based on the delivery of content rather than the emergent possibilities for engagement and interaction (Lonn & Teasley, 2009; McKeogh & Fox, 2009).

This paper draws on data from two phenomenological studies. One pilot study completed and reported elsewhere (Andrews & Tynan, 2012; Andrews, Tynan & James, 2011) and the second building on the findings of the pilot study to a) attest the veracity and extant of the early findings; and b) develop the research towards unanswered and raised questions of the pilot study. Emergent findings are reported as follows and illustrate that social media plays an important role for some distance learners whose use of social media for social and emotional learning support is surprisingly a deliberate and considered choice of students. Social media is being used by students outside of the intended curriculum design without teacher intervention.

The rise of social media

Social media, as now very well known, comes in many forms with Facebook, Twitter, YouTube, and Wikipedia being some of the most commonly used and recognised tools (Selwyn, 2012). Despite the variations in the activities they support or enable, social media “rely on openly shared digital content that is authored, critiqued and re-configured by a mass of users” (Selwyn, 2012, p.X). It has also become apparent that social media use is not just the province of young people with large numbers of older people adopting these tools for a wide range of activities (Lenhart, Purcell, Smith, & Zickhur, 2010). While the social use of these tools is undisputed, use of social media for teaching and learning activities remains less explored. Much of the current literature reporting on the use of social media for teaching and learning suggests that on-campus learners do not generally use social media much for deliberate or teacher constructed teaching and learning activities As Selwyn suggests probably no more than 10% of these leaners fall into this category. However these studies have not investigated the ways in which online distance learners use social media in relation to teaching and learning activities.

Conceptual framework: Affordance theory and its application to social media and learning

Originally conceived by Gibson (1979), affordance theory is described as a way of explaining 'what the environment offers an organism … and were thus seen as properties of the environment relative to a specific organism of group of organisms of the' (Day & Lloyd, 2007, p18.) Over time the concept has evolved with Norman's (1998) addition of the understanding of the distinction between actual and perceived affordances to more recent additions by Day and Lloyd (2007) who draw upon contextual factors in applying affordance theory. This could be extrapolated to include curriculum development, teacher facilitation and the learning environment more generally. Affordance theory therefore becomes a welcome lens to explore the wide availability and ease of use of social media (as the environment) and their wide spread use by students (human interaction). The intersection of the environment, student interaction and learners contexts (contextual factors) and the purposes for which social media have arisen may well alter and will no doubt evolve from what they were originally envisaged.

Investigating learner experience

Distance learners from five different Australian universities are participating in the studies reported here. As noted earlier the study builds and extends on a previous pilot study conducted in 2010. The original pilot study explored the 'lived experience' of twelve distance learners use of ICT for teaching and learning (Andrews & Tynan, 2012; Andrews, Tynan & James, 2011). The current study is further testing the findings of the initial study and expanding on the recommendations of that study which included amongst others further investigation of distance learners' use of social media. Forty learners across the partner universities, have been recruited under strict ethical approvals. Appropriate ethical clearance for the studies was obtained from all participant institutions, with particular attention being paid for permission to use photos, videos and voice data for presentations. To date thirty eight students have completed the current round of data collection activities and data collection will be completed by the middle of October, 2012.

Methodology

The two studies discussed here adopted a phenomenological approach to investigate the 'lived experience' of distance learners' use of technology for teaching and learning (van Manen, 1997). Students were purposively selected for participation in the study on the basis of identified criteria including: students currently actively participating in distance learning courses; students working full time and studying part time; international students; students representing a range of different course; postgraduate students; undergraduate students and students living on-campus and studying via online distance learning materials. The current study also had a specific focus on recruiting males as in the original pilot study all participants were female.

The same tools were utilised by both studies to collect data to provide 'thick descriptions' (Mayes, 2006) of distance learners' daily experiences with technology for teaching and learning. The data collection tools which included two journal tools, the Day Experience Method (Riddle & Arnold, 2007) and Charting the Week's Activities (Andrews & Tynan, 2012) provided the participants with an opportunity to provide detailed daily accounts of their activities.

The Day Experience Method (DEM) is designed to collect a snapshot of participants' activities. It involves sending text messages with a set of questions to participants on their mobile phones at irregular times throughout a 24 hour period (Riddle and Arnold, 2007) Participants were required to answer the questions at the time they receive the message in as much detail as possible. The questions asked participants to identify their activities at the time the messages were received as well as information about who they were with, what technologies they were using and how they were feeling. For the purpose of these studies the DEM was adapted slightly to cover an eighteen-hour period and during this time participants received 7-8 msn messages.

The Charting the Week's activities (CWA) was developed by the first author for the pilot study to overcome perceived limitations in the DEM method in developing an understanding of patterns and routines in the ways in which distance learners use technology for teaching and learning. For the CWA, participants were required to provide a summary of their daily activities including learning activities across a week. Participants could use print, video or audio for their diary activities. Participants were required to provide a photo or photos of their learning spaces. Learning space was identified as any space they used to engage in learning activities. The photos were used as prompts in follow up focus group discussions conducted using Skype and a software tool that plugs into Skype, Call Recording, was used to record the Skype conversations.

Analysis was undertaken using Interpretative Phenomenological Analysis, (IPA) an approach described by Mayes (2006) and requiring reading and re-reading the data to extract themes and meaning.

Results and discussion

As noted above analysis was conducted using IPA, with the conceptual framework of affordance theory being used for the first time to assist in the explanation of the learners experiences. Fifty students from five universities have completed the study so far. These students represent a wide range of distance learning contexts including international students, postgraduates, undergraduates, males and females, full and part time workers, full and part time students. Programs represented include Primary Teaching, Secondary Teaching, Education, Environmental Science, Psychology, History, Social Science, Music, French, Italian, Business, Science, Maths and Agricultural Science. To date, ten males have participated in the study. These participants also represent a great deal of diversity in their ages, personal circumstances, work and family situations. The analysis of data, although in the early stages, suggests that use of social media to augment and extend the learning experience is emerging as a strong trend from both studies. While there is no doubt that some learners make little use of social media for teaching and learning as suggested by Selwyn (2012), forty one (more than eighty percent) of the students that have completed the study to date, currently make deliberate use of social media to augment their learning in some way. Below in table 1 is a summary of some of the social media technologies being utilized by distance learners, the ways in which these learners are using them to support teaching and learning activities and their reasons for adopting these tools.

Table 1: Distance students' use of social media to support teaching and learning activities

Social media	Activity	Reason for using social media
Facebook	Replacement of BB discussion forum Language learning Creating a learning community Connecting to experts	Dissatisfaction with quality of discussion Dissatisfaction with BB discussion forum interface Practicing a foreign language in a safe environment Passion for learning and desire to connect with other learners around items of interest Accessing other 'expert' opinions
Skype	Assignment Discussions Completion of quizzes Participation in informal learning	Opportunity for real time discussions Discussion of assignments/developing an awareness of different perspectives
MSN	Connecting with other learners	
Blogs	Connecting to other professionals	Seeking alternative expert viewpoints Engaging in professional discourse around course topics Participating in special interest groups related to studies
YouTube	Watching educational videos Animations	Dissatisfaction with quality of institutional lecture recordings Seeking other recognised experts' views on subject matter Seeking additional content to that provided Seeking increased understanding of content
Yahoo groups	Discussion with experts Special interest groups	Seeking alternative viewpoints Engaging in professional discussions
Google tools	Special interest groups	Engaging in professional discourse around course topics

As shown in Table 1 our emergent findings are explicitly identifying ways in which some distance learners are using social media to augment and enhance their learning experience. As noted, some make considered decisions to 'stretch their understanding' beyond what is provided by the institution. The affordances of social media enable easy access to 'experts' or professionals in the field who are themselves active users of social media. Furthermore, this kind of activity has enriched and extended students' learning experience well beyond what was perhaps intended by their universities. In some cases this kind of activity was motivated by a lack of meaningful interaction on institutional forums. For others it was a desire to extend their learning and develop alternative perspectives to deepen their understanding. There are also indications that some students, familiar with the ease of use of widely available social networking tools and other popular online technologies struggle with the perceived un-user friendliness of tools such as institutional learning management systems and are shifting their learning activities, both formal and informal to these tools: *It's so hard to find anything in blackboard (discussion) and so difficult to search. I don't know why they don't do it like Facebook* (participant, CQU University, 2012). These emergent findings offer insights when viewed through the conceptual framework of affordance theory. It appears that where learners augment their learning experiences through the adoption of social media that they are demonstrating an evolving new use of social media where the learning context and human interaction as afforded by social media (Day & Lloyd, 2007) are merging into an unexpected learning space which was previously used for more personal and social interactions.

Conclusions

The emergent ideas presented here suggest that there is a need for universities to recognise that distance learners are using social media to support a range of learning needs in unexpected ways and that this trend is most likely one that will continue to grow as internet users develop greater familiarity with the range of technologies and resources available and accessible online and the affordances they enable in teaching and learning contexts.
It may be worth noting that learners need to be able to perceive potential affordances in order for them to be actualised and learning conditions need to support the use of those potential affordances. If, as the data here suggests, there is an emerging trend in the use of social media by online learners in higher education, the implications for institutions will include the need to help all students to see the potential affordances of social media within the learning context and to support the realisation/utilisation of those potential affordances. Such support could include re-structuring of learning and teaching activities, support and development of teachers and support of technology. Furthermore, given that students are accessing study materials from a diverse range of sources, rather than relying on those provided by the institutions at which they are undertaking their studies, there is an increasing need to ensure that students possess the skills necessary to evaluate the credibility of the sources they are using to augmenting their learning.

Engaging higher education students via digital curation

Amy Antonio
University of Southern Queensland

Neil Martin
University of Southern Queensland

Adrian Stagg
University of Southern Queensland

The emergence and adoption of freely available digital curation tools has shown a public desire to locate, evaluate and organise web content into manageable, shareable collections. These tools occupy a unique niche, often overlapping with other web tools. This necessitates a clear definition of tools laying claim to this space and suggestion and direction for the use of digital curation to build student engagement. A definition is suggested, as well as a discussion on the emotional design principles and how they build sustained engagement with users.

Keywords: digital curation, digital literacy, information literacy, student engagement, higher education

Introduction

The ubiquity of the internet has led to the easy availability of vast amounts of information. Therefore, the development of information and digital literacy skills is critical for the 21st century learner. An emergent suite of digital tools have aligned themselves to the perceived need to locate, select and synthesise web content into open, user-organised collections. Constructively aligned with learning outcomes, these tools potentially support the development of academic reading, writing, and research skills for higher education. This paper will, firstly, establish a definition of digital curation which will robustly stand apart from the mainstream, market-driven catchphrases already in existence; attendant with which is the construction of a framework for evaluating the fit of digital tools to the curation definition. Secondly, the emotional design of these tools to potentially improve student learning outcomes is explored and, thirdly, practical suggestions for using these tools to enhance the learning experience are offered.

Defining Digital Curation

While definitions of curation have been proposed, they have not been applied to, or tested against, the tools that could benefit from such a classification. Prior definitions have included the addition of an active and ongoing editorial component to a digital collection of content (Scime, 2009) or the human filtering and organisation of information (Rosenbaum, 2010). The maturation of these tools necessitates a more fulsome definition of digital curation, which is proposed as:

> an active process whereby content/artefacts are purposely selected to be preserved for future access. In the digital environment, additional elements can be leveraged, such as the inclusion of social media to disseminate collected content, the ability for other users to suggest content or leave comments and the critical evaluation and selection of aggregated content. This latter part especially is important in defining this as an active process.

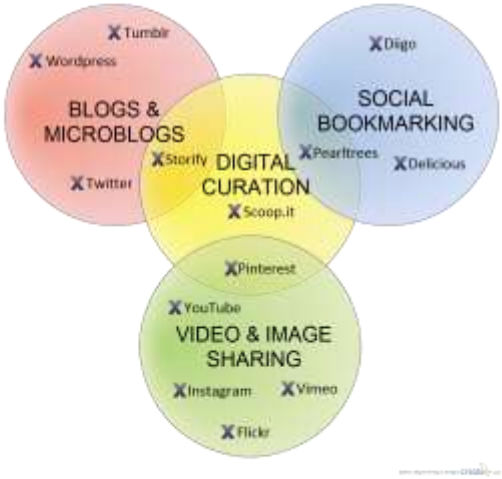

Figure 1: Digital Curation Tools

Conceptually, this definition can be expanded to four distinct, yet overlapping areas (Figure 1), informed by the users' primary activity within the tool. These are blogs and microblogs, social bookmarking, video and image sharing, and, at the centre, digital curation. Scoop.it requires the user to define the sources from which potential content will be suggested. These automated searches gather content from the selected sources, but the decision for content inclusion rests completely with the end-user, making this an active process. A social element is also introduced as users can suggest content to others, and collect content from other collections. Some tools (Storify, Pearltrees, and Pinterest) overlap with but are not exclusively curational, yet require tangential discussion to establish the validity of the definition proposed by the authors. Storify (a blogging and curational service) allows users to actively draw in content from disparate sources (such as news feeds, websites and social media) in order to construct a narrative. However, there is no functionality to embed suggested content from other users or aggregated content based on keywords. Pearltrees facilitates web content collection similar to social bookmarking and visually presents the linked content but it is dependent on user-discovered information. Pinterest curates information and supports image sharing by allowing users to both post their own content on 'pinboards' and collect content from other users (referred to as 're-pinning'). While Pinterest has aspects of digital curation, it lacks the ability to suggest content for the user.

Emotional Design

The complex interplay between cognitive, emotional and behavioural responses to create positive and engaging online experiences is influenced by Maslow's Hierarchy of Needs (see Maslow, 1954: p. 236). The reconceptualisation of the hierarchy for web user needs is directly relevant to the design and adoption of digital curation tools (see Walter, 2011: see Chapter. 1) (Figure 2). Functional needs refer to the user's ability to complete the task required (despite the lack of 'smoothness' of the experience) while reliability depends on the consistent, 24-hour availability of the web. Usability denotes how the design principles impact on the ease of use of initial exposure to the technology whilst emotion, (represented by the uppermost segment in Figure 2) pertains to positive emotional responses such as pleasure, fun, and delight. This latter is particularly pertinent to the potential of these tools to engage learners.

Figure 2: Web User Needs (Walter, 2011)

Prior research has shown a correlation between emotions and the learning process. Isen (see Isen, 1990: p. 76) examined the impact of feelings on cognition and social behaviour, finding that positive feelings facilitate active information recall. Izard, Kagan and Zajonc (see Izard, Kagan & Zajonc, 1984: pp. 5-6) argued that one's emotional state before learning may affect one's cognitive results. Alternatively, emotions may develop throughout the learning process and, in such cases, emotions tend to shift a person's prior goals to something new. It is reasonable to assume that emotions play a role in determining how much knowledge is retained (Hay, 2008: pp. 1269-1283). Excessive negative emotions may hinder the learning process while positive emotions are likely to build confidence and self-efficacy, thus encouraging the student to attempt and persist in new learning opportunities (Bandura, 1982: pp. 122-123). Bandura's social cognitive theory of psychological functioning (see Bandura, 1977) suggests that much of human learning occurs in social environments. Self-efficacy is a key tenet of Bandura's work suggesting that a higher sense of self-efficacy (one's perceived capabilities for learning or performing actions at designated levels) positively affects learning, achievement, self-regulation and motivation. As students perform tasks and observe their learning progress, self-efficacy for continued learning is enhanced (Schunk & Mullen, 2012: p. 221).

Emotional and social components of learning are intrinsically linked. If educational technologies (particularly digital curation tools) can yield positive emotional responses, then their use in higher education potentially leads to positive learning experiences and, by extension, improvement in learning outcomes. In a study that explored the relationship between emotions and the acquisition of computer knowledge, it was found that negative emotions were negatively correlated with ability (in relation to nine computer-based skills measures), while positive emotions (happiness) showed a positive correlation (Hay, 2008: p. 1275). Social networks, such as Twitter (Junco, Heiberger & Loken, 2011: pp. 119-132; Hoffman, 2009: pp. 92-100) have shown a positive influence on student motivation, retention and engagement, while similar conclusions have been drawn in previous studies of community college students (Hughes, Karp & O'Gara, 2009: p. 195; Karp & Hughes, 2009: pp. 73-82). In these cases, students tended to benefit from social experiences integrated with their course learning. While the existing research has focused on harnessing social media tools to increase student involvement, the potential of digital technologies to emit an emotional response and engage the learner is still in its infancy.

This paper proposes that digital curation tools (specifically Storify, Pearltrees, Pinterest and Scoop.it) can be utilised in higher education curricula to increase student motivation and engagement and, potentially, improve student learning outcomes. Evidence (see Reeve, 2012: p. 149) suggests that students' engaged in self-directed learning display higher levels of motivation, and it is the convergence of autonomy, engagement and educational technology driving our exploration of these tools. Each tool fosters a sense of ownership and potential for personalised learning. Moreover, the aesthetically pleasing layout of these tools is a foundation for emotional attachment which makes sustained engagement in the activity desirable. The learner also gains a sense of autonomy and ownership of the digital collection. We contend that this has the potential to encourage the learner to interact with these tools on a regular basis. The learner has a certain degree of control over their learning journey, in terms of the ability to synthesise and filter the information coming to them, and control over the final presentation of that content. If the social component of learning can be successfully integrated into the curricula, then it can be reasonably argued that curation likewise has educational potential.

Digital Curation Tools in Higher Education

Table 1 offers a number of suggestions for using each of these digital curation tools in higher education.

Table 1: Applications of Digital Curation Tools in Higher Education

Tool	Possible use in Higher Education	Extending on the work of…
Storify	**Journalism students** could use Storify to depict a current story as a series of images and social media posts to engage a wider, authentic readership. **Political science students** could map an election, and responses to policy in this format.	Harsch, B, 2011 Markey, L, 2011
Pearltrees	**Philosophy students** could evaluate and visually organise disparate web resources for assessment tasks. **Tutors** could curate and build a visual representation of resources in their subject area.	Team Plenk, 2010
Pinterest	**Visual Arts students** could create a portfolio showcasing their work whilst gathering inspiration from others. **Marketing students** could explore brand image and social media marketing strategies.	Yale University, 2012 Duke University, 2012
Scoop.it	**Literature students** could filter and synthesise web content, creating an annotated bibliography. **Knowledge Management students** could create a group repository of knowledge.	Dixon, S, 2012

Conclusion

Emotional design principles can shape learning and teaching experiences, and recognising their significance merits further consideration in both learning theory and pedagogical practice. This paper has offered a number of suggestions for embedding digital curation tools into higher education, focusing on increasing student motivation, engagement and, potentially, student learning outcomes. The proposed definition seeks to give practitioners a framework for aligning a tools' purpose with learning and assessment activities.

Follow me! Increasing participation in online conferences

Amy Antonio
Australian Digital Futures Institute
University of Southern Queensland

There have been mixed reviews about the use of Twitter for increasing interaction during online conferences. Social media platforms such as Twitter have the potential to satisfy a perceived need for networking and communication opportunities that are commensurate with the face-to-face environment but generally lacking in the online world. However, a reluctance to adopt new and emerging technologies, or perhaps a lack of understanding about how to use Twitter for a more interactive conference experience, has inhibited its success. This paper reports on the use of Twitter in the Follow the Sun Online Learning Festival and provides an overview of the challenges involved in encouraging and sustaining participation in a virtual environment.

Keywords: Twitter, social media, online conferencing

Introduction and Background

Conference organisers have already discovered that Twitter is ‘a powerful component of one’s networking activity’ (Reinhardt et al, 2009, p. 147) and are thus using this microblogging platform as an additional form of communication during face-to-face conferences. In an analysis of ‘How people are using Twitter during conferences’, Reinhardt et al (2009, p. 153) argued that ‘Twitter helps you reach out to others with similar interests [and] provides networking potential’. Martin Ebnar (2009, p. 97) likewise found that the use of Twitter during a conference ‘enhanced the words of the keynote speaker [and] turned the presentation into an interactive, highly attention-evoking act’. Twitter enabled ‘the previously hidden thoughts of the participants…to become visible and thus helped to deepen the presented subject’ (Ebnar, 2009, p. 97). While the use of Twitter for increasing interaction during face-to-face conferences has been widely documented, little is known about the potential of Twitter for creating networking opportunities in online events.

This paper reports on the use of Twitter as part of an online, synchronous conference, which was organised by the Australian Digital Futures Institute at USQ, Beyond Distance Research Alliance at the University of Leicester and Athabasca University, and the challenges involved in encouraging participants to adopt and interact with this written, and often foreign, form of communication. There is no doubt that the social component of the traditional conference contributes to its appeal. Most people like to travel and to ‘meet and interact with other people who are physically present’ (Kimura & Ho, 2008, p. 121) and the ‘spontaneous and random socialising and networking that can happen…may be inhibited or even eliminated by online participation’ (Anderson & Anderson, 2009). However, online conferences can be organised to utilise an array of communication modes to promote interaction. The purpose of using Twitter during the Follow the Sun Online Learning Festival was to analyse how people are using social media during online events.

Establishing a Twitter presence for #FTS12

Twitter was used during the Follow the Sun Online Learning Festival to add a dimension to the conference by allowing geographically dispersed individuals to communicate with each other. At the conclusion of the conference, delegates received a survey that analysed their social media usage throughout the event and the main messages that were expressed via Tweets. Delegates who consented to their Tweets being analysed were required to use the conference hash tag (#FTS12). It was found that the majority of Tweets were informative, instructional, promotional or conversational. (See Table 1)

Table 1: Categorisation of Tweets from Follow the Sun

Tweet Category	Example Tweet
Informative: Tweets that pointed to resources with an accompanying link	'Recordings from #fts12 now available @ http://t.co/smWYn413'
Instructional: Tweets with a directive to perform an activity.	'Click latecomers link to join! http://t.co/5iTLCwN'
Promotional: Tweets that promoted an upcoming presentation.	'Nominal Group Technique Session @ #fts12. Join us!'
Conversational: Tweets that included an observation or expressed an opinion.	'Interesting conversation about the future of the world' or 'Very impressive start to Follow the Sun!'

Twitter usage, according to Java et al (2007), can be roughly categorised into three types: information sharing, information seeking and friendship-wise relationship. However, analysis of the Tweets emanating from the Follow the Sun Online Learning Festival indicates that information sharing was the primary motivator for using Twitter during the online event. The informative, instructional and promotional Tweets invariably provided information for others regarding an upcoming presentation, change of location or a complementary link to issues discussed. There was no evidence to suggest that conference delegates used Twitter as a friendship-wise relationship tool. In fact, despite the networking potential of social media platforms, only 41% of survey respondents indicated that they were actively listening, asking questions and/or communicating using social media during the sessions and 36.2% of respondents said that they did not communicate with others during or after the festival. This suggests that, despite the best attempts by the conference organisers to facilitate an interactive, social learning climate, creating a community or network is challenging in the text-based environment.

Conclusion

Initial indications suggest that when used appropriately, Twitter is extremely useful for the fast exchange of thoughts, ideas and information. Twitter proponents value its potential as a backchannel for the reportage of live events and the layer of interconnectivity it provides, while its critics chastise the tool as a meaningless distraction. A number of challenges need to be addressed before Twitter can be used as a networking tool at online events. This form of written communication does not come naturally to most people and it cannot be assumed that all conference delegates will embrace it. Conference organisers need to both educate participants on how to network in an online community and find alternate means of interacting with those who are disengaged with Twitter. From the outset, conference facilitators need to explain that the intent is to share important ideas, gage audience reactions and push thoughts and ideas to a new place. The key is to figure out how to implement these social networking platforms, whilst managing expectations of what is actually possible in an online verses face-to-face environment.

Using a Learning Management System organisation as a resource site for blended learning

Liz Askew
Centre for Support and Advancement of Learning and Teaching (C-SALT)
University of the Sunshine Coast

The majority of universities in Australia provide learning and teaching resources to staff via their corporate website, or through their own intranet system. This is not possible at the University of the Sunshine Coast and so an alternative had to be provided. Rather than place many files in a central area, it was decided to utilise the organisation facility of the Blackboard Learning Management System (LMS). This poster outlines the goals and processes of designing the site as well the future plans for its implementation.

Keywords: Blended learning, learning management system, professional development

Introduction

By 2011 the University of the Sunshine Coast, a predominantly on campus teaching institution, reached the stage whereby every course delivered was required to have an online presence. As a result, all teaching staff were beginning or continuing their journey into blended learning. Support for teaching staff up until that point was delivered predominantly through individual faculties, with few university-wide resources. To provide professional development resources to all staff, allowing anywhere, anytime access, a central repository of material was needed. A Blackboard organisation was chosen to become the access point for these university-wide resources, in lieu of an ability to utilise the university website.

Development

Initially it was thought that the use of an organisation in Blackboard would be limiting. Concerns included the limited flexibility of presentation and arrangement/management of material. However, on further consideration it was decided that there were potential benefits of using the LMS, along with elements that could be maximised to encourage staff development in the online environment. The analysis of using Blackboard is outlined in Table 1.

Table 1: Analysis of the Blackboard environment as a resource site

Challenges	Advantages
Difficult to format and make visually appealing	Model layout and design
How to manage high volume of material in folders	Model good practice in presenting material e.g. learning modules
Lack flexibility of HTML formatting	Good practice examples of educational tools available in the LMS
	Demonstrate future possibilities e.g. template material
	Opportunities to use and model collaboration tools
	Closed to public – potential to encourage sharing

By using the LMS, staff will be able to experience modelling of elements of course design directly in the LMS itself, share in an safe environment with a known audience and see examples of pedagogy from the showcase area, all of which are characteristics of effective professional development for teachers (Harlen & Doubler, 2007). Including and encouraging examples of staff practice will demystify the unknown of what colleagues are doing, seen as a significant barrier to educators integrating blended learning approaches into their teaching practice (Diaz & Brown, 2010). The use of the LMS blended learning site will both ‘emulate the student experience’ along with providing a home for a learning community, both factors used as guiding principles in Penn State University development of blended learning (Diaz & Brown, 2010).

A secondary outcome of the site is that it will become an educational tool to build staff competencies, and this aspect is already being trialled at sessional staff development workshops. Staff are guided through the site to find resources to address their individual learning needs, and are encouraged to take an experiential learning approach to ‘help themselves’ with future queries.

Design

The site was geared towards those staff beginning their journey into blended learning, but provided considerations for staff who were further along the blended learning continuum. A conscious effort was also made to not overload the site with information. For example, the key areas of good practice and planning included a one page overview of each topic, a more detailed explanation for those interested to learn more, then a case study from a university staff member to illustrate each topic. An outline of the structure is provided in Table 2.

Table 2: Blended Learning site structure

The essentials	Blended Learning frameworks including good practice and planning Best practice modules – based on available tools Student survey results Accessibility, Copyright, Netiquette
What's new	A snapshot of sites indicating the future of blended learning in higher education
Blended Learning at USC	Blended Learning Statement Support details
Showcase USC	Examples of technology being used by staff
What works for me	Blog – staff contributions
Educational technologies	Summary of available technologies plus support material
Blackboard help	Orientation material, Tip sheets, Examples

Next Stage

A key development of the blended learning site will be to make it dynamic and endeavour to grow a community of practice among its users. This will require an investment of time and energy of support staff, as virtual environments are prone to decline in activity (Johnson, 2001). A communication plan will be required to notify staff of the changes, developments, new resources, along with notification of responses to their feedback. Strategies will need to be developed to promote and maintain interest in the site, along with activities to encourage active engagement; factors recommended for enhanced practice (Keppell, McDermott & Hard, 2011). It is hoped that an advantage of using the LMS will be the closed but familiar environment, potentially providing a private community for USC staff and therefore increasing the potential growth of a community of practice (Wenger, McDermott & Snyder (2002).

At an appropriate time, the site will be formally evaluated. An analysis of the Blackboard usage statistics will be conducted to gauge the level of activity in each area. A follow-up survey will be implemented to gather staff feedback regarding the usefulness of the site and to inform future developments. Evidence gathered will be fed into a University level Action Research project lead by a member of the Blended Learning Team.

Growing, leading and measuring online Communities of Practice

Diana Ayling
LLB, MBS, GDHE
Te Puna Ako – Learning and Teaching Unit
Unitec Institute of Technology

Diana Ayling is an academic staff developer and community co-ordinator of New Zealand's largest online community of practice for professional development.

Hazel Owen
BA (First Class Hons), MA (First Class Hons), MLitt (MPhil equivalent), CELTA
Director, Ethos Consultancy NZ Ltd

Hazel Owen is an education consultant with an interest in all aspects of ICT Enhanced Learning and Teaching, especially when underpinned by social learning and communities of practice. In addition, Hazel is keen to develop creative ways of scaffolding and empowering learners, and to foster learner-led, culturally responsive, contextualised approaches.

Intended audience and degree of expertise/past experience required

This workshop is suitable for leaders of learning who are considering establishing online learning communities in their organisations. Some experience with social networking would be an advantage but not necessary.

Statement of objectives for the workshop

By the end of the workshop the participants will:

Knowledge: Understand the key concepts, principles and terminology of leading online learning communities.
Skills: Identified the key skills of facilitating and leading an online community of practice.
Values: Appreciate the value of learning and sharing together to enhance learning opportunities and enhanced performance in the workplace.
People: Have strategies to connect, and collaborate with others to build and lead an online community
Learn: Locate, evaluate and share resources for building online learning communities.
Integrate: Integrate an online learning community into their existing practice and a learning leader.

Detailed description

The workshop participants in groups will plan, create and develop an online community of learners. The facilitators will share strategies and approaches they have learned from the experience of establishing and facilitating two growing, vibrant online communities of practice that are specifically focussed on professional development within education contexts. There will also be guidelines on how to grow an online community of practice from scratch, as well as ideas that will help manage expectations, and manage risks.

The participants, during this workshop will 'learn by doing' as they become part of a live community. The aim is to create a live learning community that supports the facilitators and developers of other online communities as workshop participants establish them.

Thinking, researching and living in virtual professional development community of practice

Diana Ayling
Unitec Institute of Technology

Hazel Owen
Ethos Consultancy Ltd

Edward Flagg
Unitec Institute of Technology

This paper is a comparative case study of two virtual professional development (VPD) communities of practice established and maintained to support teachers in their learning and development. Each community was studied and evaluated by its facilitator. The purpose of those studies was to identify behaviours and capture shifts in educators' professional identity as they engaged in VPD. The researchers were interested in those practices that indicated embedding of practice, co-construction of knowledge, and development of skills and values. Many of the factors identified in the VPD initiatives explored the link to the wider conversations that are occurring around education in general in a time of change.

Keywords: virtual professional development, communities of practice

Introduction

Educators today are working within an environment of continual change, with influences from both external and internal sources. Teachers are challenged to justify their curriculum, methods, and approaches to student learning. Under this intense pressure each teacher has their own way of coping and their own unique identity. Each teacher, busy with a full workload, is trying to address these issues within their own context. As such, there has never been a greater need for teachers to be supported by like-minded educators and leaders, who are connected in networks. This paper explores the initiation, development and leadership of two virtual professional development communities of practice in a time of great change in education. The research conducted in each community is also described and compared. The commonalities and differences of two online CoPs provide rich insight into educators' community development, participation, learning and developing identities.

Background

Communities of Practice (CoPs), that enable situated learning are based on previous research into learning in professional practice. (Lave & Wenger, 1991 & Lai, et al, 2006). The CoPs include facilities of knowledge management and professional growth for a group of people who, via a common space on the Internet, engage in public discussions, interactions, and exchanges (Tilley, Hills, Bruce, & Meyers, 2002, Wenger, 1998, Owen, 2011b, Lave and Wenger, 1991 & Flagg & Ayling, 2011).

Central to participation in an online CoP is the concept of an educator's identity. Wenger (1998) explained, that "issues of identity are an integral aspect of learning and are thus inseparable from issues of practice, community and meaning" (p. 145). Identity is the 'pivot point' between the social and the individual. Westfall (2000) suggests that "the idea of truly departing from social hierarchy and restriction does not occur on the Internet...with identity construction still shaped by others" (p. 160), in particular in response to each individual's literacy and communication skills within the online context. Identity according to Grey, (1994) is a project of self. There are two types of identity Common and Common Bond. The Common Identity is commitment to an enterprise or a value, where as the Common Bond is to the people involved in the enterprise (Prentice, 1994). According to Handley (2006) we derive our identity from the communities to which we belong and are accepted. Utz and Sassenburg (2002) suggested that membership of a community relates to identity and identity relates to purpose.

To further understand the ideas that underpin VPD engagement and participation in online CoPs, the work of Schlager and Fusco (2003) provides a useful structure. In their research into a large, multi organisation VPD project, they used the Activity Theory Framework (Engestrom, 1987, 1999; Cole & Engestrom, 1993) to analyse how individuals and groups engage in a VPD. Schlager and Fusco explained that participation in online community is a new project (activity), designed to support and develop members (subjects), to use new activities and information (tools), to improve their performance (object). To undertake these activities using tools and objects, members must take on new collaborative roles (division of labour) based on values and norms (rules). The members are encouraged to develop trust in, and form lasting relationships with, one another (community) as they implement new ideas in their practice.

The authors believe educators find the pace, nature and demands of change from external and internal sources extremely challenging. Ann Austin, (2012, p 57) says the work teachers do must be understood within, and connect and respond to, a rapidly changing world. As such, teachers should offer both vision and practical paths to aid students and the broader society in moving forward with hope, wisdom, integrity and courage. William G Tierney, (1992) believes educators need to create communities that recognise and honor difference, cultivate respect and foster dialogue. In these communities, communication as a concept is in constant negotiation, dialogue and reformulation, and the process is characterised by the 'politics of hope'. In such dialogues individuals retain their unique identities, while meaning is created for the organisation. The challenge for the leaders of these communities it so create online community spaces, which aid and promote conversation, are key elements to fostering communication.

Context

The authors of this paper are community facilitators/leaders of two online CoPs, which, between them, have over four hundred educators and leaders as members. These virtual communities were formed to support educators and help them develop professionally by providing access to resources, connections and support. The members of these communities are located over a broad geographical base, working in diverse organisations, and across a variety of educational levels, from primary through to higher education. The communities have grown organically over a three year period and become lively, vibrant and safe spaces that encourage conversations around professional practice, identity and student learning, as well as being containers of 'things' (Ashton, 1999), such as resources, conversations, videos, podcasts and images.

Community One:

This CoP, 'The Teaching and Learning Community at Unitec' (T & L Community - http://tlcommunityunitec.ning.com/) was established in 2009 and had, by early 2011, evolved into New Zealand's largest and most active online teaching and learning CoP, with over 360 members engaged in higher education from across New Zealand and around the world. The focus of this community is higher education and the community is drawn from a range of different organisations, although the predominant membership is from one large institute of technology in New Zealand.

Community Two:

The Virtual Professional Learning Development (VPLD) online community was established in November 2009, and now has one-hundred-and-thirty-five members located in and around New Zealand. Members of the community are mainly from the primary and secondary sector, although there are a few members from tertiary or associated PLD providers. Most members are located in a variety of schools and education institutions, although the core focus of the community is the VPLD programme, which directly involves thirty-five of the community members.

Aim

Each VPD was evaluated at different points in their development. The purpose of those studies was to identify behaviours and capture shifts in educators' professional identity as they engaged in VPD. The researchers were interested in those practices that indicated embedding of practice, co-construction of knowledge, and development of skills and values.

Method

Community One:

The development of this site had been based on the work of Wenger, White and Smith (2009) and was structured on findings from White's Online Community Builder's Purpose Checklist (2009). The study was three months duration. It employed a single survey and an examination of the Teaching and Learning Community website using platform observation and Google Analytics. At the time of the survey there were 280 members of the community and 23 members responded to the survey. The return rate of less than 10% is not uncommon in online environments, where a small core are fully participating members.

Community Two:

The VPLD initiative has been underpinned by a research focus since its inception (October 2009), which performs an iterative feed-forward function as well as providing outcomes and comparative longitudinal evaluation data. Data has been collected from all areas of the VPLD online CoP, from project documents, recorded discussions and notes from mentor meetings, and from Webinar sessions, as well as via three online surveys per year in 2010 and 2011 (conducted in January, June, and November/December). The main question pertaining to the VPLD online CoP was: How are participants' opinions of the value of the VPLD pilot affected by participation in the VPLD CoP?

To assist in the comparison of results across the online VPDs, only data collected using the online surveys of 36 participants will be reported. Designed with mainly open-ended questions, the survey aimed at gathering richer, fuller understandings of the experiences of the VPLD participants as well as gathering suggestions for the future of VPLD.

Results

In both communities the members' responses to the surveys provided insight into members' participation in the communities. The research findings are examined within the structure of the Activity Theory Framework (Cole & Engestrom, 2003). Using themes from the Activity Theory Framework the authors have categorised responses relevant to themes of activity, subjects, tools, object, division of labour and rules. These themes provide valuable insight into participation, learning and identity.

Participants (Subjects)

Overwhelmingly, the participants in both VPD communities were teachers and/or leaders within education. Some members were managers, and some had professional development roles. The majority of members were teachers with full time teaching responsibilities and they were diverse in knowledge, experience, skills, locations, and teaching contexts. To fully understand how the VPD environments support teachers it is essential to understand their nature and characteristics. Both CoPs studied had variable levels of participant engagement, which depended on the members' confidence, capabilities (digital literacy), motivations, access to technology, and available time. Not all members had equal opportunities to fully participate in the VPD environments.

Community One respondents in the higher education environment had very different levels of participation. As the literature explained (Lave & Wenger, 1991; Brown & Duguid, 1991; Wenger, 2009), more than three quarters of the members of any online community take the valid role of passive consumers of community cultural artifacts (resources, knowledge, skills and values). Interestingly, just over a quarter of the members (27%) uploaded a photo of themselves to their profile page on the CoP platform. By uploading a photo teachers were be more likely to be ready to participate in a VPD. This could be seen as an integral part of teacher identity, as well as being indicative of existing skill sets.

Community Two, at the time of publication, has seen 100% of participants upload a profile picture, and contribute some information about themselves and where they are working, suggesting a strong sense of belonging, or desire to belong, as well as indicating the positive modelling by existing members of the community. While some might point to a reasonable level of digital literacies as one of the reasons there is such a high rate of profile development, the survey responses indicate that participants have a wide range of technical skills, familiarity with social networking, and access. For example, during the course of the pilot project (2010) it became obvious that there was not equality of access to the technology itself, or in the level of technical support provided by the institutions.

In any self-motivated learning environment participants are provided with the freedom to choose whether to engage (with or without genuine enthusiasm), and some will decline to embrace the opportunity (Bruckman, 2003). This is an important part of identity. The aim of the VPD's was to find a balance or compromise between self-motivated and socio-constructivist environments, where engagement and up-skilling were the ultimate rewards, and a more traditional perspectives where professional development was directly linked to performance reviews and promotion. It was challenging for the facilitators/leaders to find the right balance, especially as work commitments ebbed and flowed for participants.

Learning about practice (Object)

The object of both CoPs was to support teachers' professional development, in part by removing barriers of time and geography. The CoPs delivered both formal and informal (spontaneous) learning. While not specifically delivering online professional development (in the sense of generic workshops), the VPD environments were established to support situated learning (Lave & Wenger, 1991). As such, the aim of the facilitators was to create environments where educators could learn *from* and *with* each other (Wenger, White & Smith, 2009, p. 7). Practitioners were encouraged to share and reflect on their day-to-day experiences, stories, and ideas. Key to this approach is a willingness to learn more about practice.

Community One

The respondents in this community recognised the professional development purpose of the community and the need to assimilate new learning into professional practice. One respondent spoke of the positive sense of innovation and creativity provided by an online community.

> The Ning is quite liberating, because in a sense, it enables us (participants) to leave the box (figurative or actual!) in which we work, and cast off the restrictions and 'urgency' of our day to day roles to reflect, explore and give commentary on those issues which are important in our practice, or about which we are truly passionate.

The facilitator/leaders were an experienced and active presence in the CoP. Resources were created and developed by members through blog posts, while discussions on speciality topics in education were held in groups. Members with a 'strong online presence' had created and shared, and participated in a variety of discussions in the community groups. However, it was the norm for members to consume rather than contribute and collaborate. In terms of Activity Theory, this disconnection between members' perceptions about their competence and behavior was important to understanding their participation. As higher education is a competitive environment with individual rather than group rewards, it is not unusual to find members learning from the community without feeling any obligation to reciprocate by contributing to community outcomes and resources.

Community Two

The VPLD online CoP has developed into a space where practitioners feel comfortable reflecting about their experiences and their practice. Furthermore, by being immersed in an experience that models aspects such as valuing existing world views and skills, as well as making it OK to 'make mistakes', participants were often encouraged to use such approaches with their own learners. One member commented that "I often get...rejuvinated [sic] to focus on certain aspects of my teaching, which filters down to the learning of the students" (survey response, 2010). There was also a sense of re-invention and renewal expressed by participants:

> What a difference a year makes. Prior to becoming a participant in the VPLD I had been reflecting for a few years as to whether I even wanted to continue in the teaching profession. I was tired of asking students to 'copy this down' and I was sometimes struggling to engage students as participants in their learning instead of just passive recipients. My reflections and my timely introduction to the VPLD started me down the path of 'what if' (end of year reflection, 2011).

The VPLD sessions, activities and programmes were designed by the facilitators/leaders to be culturally responsive, take into consideration aspects such as accessibility (physical, technological, and geographical), while also being relevant to the wider community of education. A by-product of teacher engagement was that students became empowered co-constructors of outcomes and facilitators of sessions, as well as more confident, engaged learners who were "*empowered ...to learn on their own terms*" (*Survey response, 2011*).

> I think that I as a teacher [I] am now obsolete but my role as a facilitator is primordial and very active. Because the students are now in charge of their own learning, I am no longer at the front of the class. Instead I am sitting among them and I can go around and help them. I actually now have

more time to spend with the kids to enhance their learning (reflective post, 2011).

A culture of trust (Rules)

Both VPD communities were under pressure from internal and external influences that could increase or decrease the relationships of trust between the facilitators and the members. Trust is enhanced when teachers believe they are operating in an authentic learning environment in which members are open in their profiles and are willing to engage not only online but face-to-face. While teachers need to understand and represent their own perspectives they also need to listen to and honour the perspectives of other members. Teachers need to go beyond consumption to contribution and ultimately to implementing new ideas and technologies in their own practice. Palmer, in The Courage to Teach (1998, p 12.) explained "Good teachers... are able to weave a complex web of connections among themselves, their subjects, and their students so that students can learn to weave a world for themselves. One way of doing this is through dialogue." He goes on to explain that "identity and integrity are more fundamental to good teaching than technique - and if we want to grow as teachers - we must do something alien to the academic culture: we must talk to each other about our inner lives - risky stuff in a profession that fears the personal and seeks safety in the technical, the distant and the abstract."

Schlager & Fusco (2003) explained that a VPD CoP would benefit from fostering trusting relationships, and the formation of a lasting community where teachers encourage each other to apply what they had learned and disseminated their learning to their colleagues. Roberts (2006) suggests that in most conventional management-led organisations it is difficult to foster an environment of trust. Any such developments need to be grown within the VPD CoP. The facilitators/leaders have an important role to play in supporting both the community and members to foster their relationships with other members and to build the community. However, they cannot negate an external hierarchical and managerial approach common in educational institutions. Although none of the respondents of either online CoP identified issues of 'trust' explicitly, it is clear from the literature that trust is a key element for a successful online community of practice (Roberts, 2006; Schlager, 2003). Members of an online CoP have to believe they are learning and sharing in a collaborative and respectful environment.

Community One

The public/private exposure afforded by a VPD CoP was important for some members. The online CoP was open to the public and included a small section for members only. Some members would have preferred the whole site for members only, with no public access. One of our respondents stated,

> A good example is the opening of the CoP to members outside Unitec - a decision which I had no say in and which constrained my willingness to participate. (Survey response, 2011)

Clearly, members are challenged in an environment that requires publicly sharing of ideas and activities in an online environment. Over all 66% of respondents indicated they wanted the site public. The members gave no reasons for their preference, and this could be the subject of further research.

Community Two

Trust in Community Two gradually built as the VPLD CoP matured. The sense of collective identity strengthened, and the feeling of socially-mediated shared understandings and experiences increased, thereby helping to strengthen resilience in the face of change.

> Being geographically diffuse the creation of a community of other teachers who are progressive in their development and practice both affirms and supports the collective confidence in the validity of our projects.

Another participant wrote:

> Sometimes you feel very isolated (e.g. I am the only French teacher in my school) and you feel you are the only one doing what you do. Being part of the VPLD made me realise that I am not alone and gave me the opportunity to grow...as I could read what others were doing. This gave me great ideas to try in my own class (End of year reflection, 2011).

Social Learning (Community)

Schlager & Fusco, (2003) acknowledged that the VPD CoP model did not fit within the existing infrastructure of their members' organisations. While teachers may have been familiar with CoPs they were not used to participating in an online environment to learn more about their practice. This is somewhat ironic considering most education organisations use some form of online student learning management system, and have certain expectations of student learning, collaboration and performance within online spaces.

Community One

One respondent, from Community One raised issues of reasons and purpose of the online community stating,

> I want to know what the aims and/or objectives are, so that I can assess from the outset whether my time is best served participating in such a forum. (Survey response, 2011)

Similarly, another respondent stated,

> It's all all a bit too vague and airy fairy for me in terms of my precious time. I like to know beforehand what I will get out of any time I put in. (Survey response, 2011)

In terms of activity theory it is clear members want to know the purpose of the community before fully engaging. It is therefore the role of facilitators and technology stewards to encourage the negotiation of roles, rules and purposes of a community. Community one developed organically and these matters were not clear as the community was being established. Once more people joined and began to participate, the need for clarity was increasingly evident. Community two supported members to develop their own learning plans and goals around a project of interest to them that they would work on in their own context. As such, it is suggested that the reasons to engage in the VPD were much more transparent to members. The VPD became a valuable resource for critiquing ideas, exploring thoughts and gaining feedback, and the VPLD community became another tool for participants in their toolkit. It gave them more than they had in their own context and fostered their engagement and their change in identity.

Implications

Based on the evaluation of both Community one and Community two, and observation of the communities over a period of time, the authors conclude VPD supports teachers' engagement in professional learning. A healthy and active community can support educators and leaders to undertake transformative learning experiences that can result in a shift in professional identity, and in turn to meet many internal and external challenges. The research has provided insight into the factors that make VPD relevant and useful.

Participation and non-participation are behaviours that are based around affective factors such as identity, belonging, and trust. Such affective factors are something that contributed to what Dron (2010) refers to as 'Social Velcro' - the elements that help a community to form and 'stick' together in a way that enables them to learn effectively, but then to 'un-stick and reassemble'. The social structures that are established are underpinned by agreements about interactions, processes, norms, and rules - although these too are in a constant state of flux, being re-negotiated, re-evaluated and altered. It is likely that as more VPD groups become established, it will be the serendipitous encounters and overlaps between groups, as well as what occurs within them, that will have the potential to encourage diversity, which in turn should ultimately lead to vibrant and creative social learning (Dron, 20120).

Particularly important is the feeling for teachers and facilitator/leaders that they are part of a meaningful community of professional practitioners who share similar interests and goals. A genuine, supportive, safe, friendly, knowledgeable community, can provide opportunities for educators to take responsibility for their own learning, as well as discuss learning and teaching, troubleshoot when they face problems, and share advice, support, resources and tools. It can also provide a space for the celebration of the robustness and alternative points of view from other disciplines and sectors. VPD environments have the capacity to positively engage teachers in their own learning and practice. This engagement has positive effects for teachers' identity as self-managing professionals negotiating their role in a constantly changing and challenging education environment. VPD communities offer authentic support for teachers grappling with change and technology.

Conclusions

Many of the factors identified in the VPD initiatives explored above link to the wider conversations that are occurring around education in general, and social learning in particular. Questions are being raised around what actually should define a programme of education, as well as the role(s) of educators in social networks and learning. The general shift appears to be toward personalised learning environments, self-paced learning, and social identity (Owen, 2012). The teachers who are trialling these approaches are discovering the types of skills that they as educators, and their students as learners, need. It is here that PLD offered via CoPs will come into their own. There are affordances built into the VPD model that encourage and enable practitioners to move at their own pace, in a supported, supportive environment, with access to all that they need to scaffold their learning journey (Owen, 2011a).

Results reaffirm learning as a social phenomenon, while also indicating some members of these online communities took the valid role of passive consumers of community cultural artifacts (resources, knowledge, skills and values). Benefits reported by participants include a change in their own role as educators, as well as improvements in student engagement, and increases in the quantity and quality of collaboration and communication. While it would be simplistic to draw a direct relationship of cause and effect with the online CoPs and these reported shifts, there is an indication that an effective approach to PLD provision is one that does not divorce the educator from their context, or add to significantly to their workload, but which does enable them to be connected and professional *learners*.

ASk for student teachers: An online support site for ECE student teachers to develop their academic literacy

Mark Bassett
Academic Skills support team
New Zealand Tertiary College

ASk101 is an online academic literacy development site for early childhood teacher education students at New Zealand Tertiary College, a specialist early childhood teacher education provider. The site provides equitable access to information and support staff for all students, the vast majority of whom are online distance learners. The Poster demonstrates the personalised and interactive features of this site, which meets the challenge of sustainable online support for an ever increasingly diverse student population.

Keywords: Academic Literacy. Early Childhood Teacher Education. Online Learning. Interactive. In-person Support.

Introduction

ASk101 (or, **A**cademic **Sk**ills 101) is an online academic literacy development site. The users of this site are early childhood education (ECE) student teachers, enrolled in initial teacher education programmes at under-graduate and postgraduate levels. It is crucial for these students to develop and master academic reading and writing skills within the content of their study programmes. Weaving academic literacy development with discipline specific content is effective, with text based contextualised online writing support having already been piloted with positive outcomes for Education students (Straus, Goodfellow & Puxley, 2009) and Pharmacy students (Wingate & Dreiss, 2009). Working with Commerce students, Percy, Yanamandram and Humphrey (2007) audio streamed a lecture on referencing, which was linked to related online quizzes. ASk101 blends text based information with audio, videos of tutorials and animations, along with enabling access to support staff. The site has been developed as a cross-departmental project between the Academic Skills (ASk) support team (comprised of lecturers with expertise in academic skills tutoring) and IT developers at New Zealand Tertiary College (NZTC). A key goal of the site is to offer sustainable and equitable support to all students.

Academic literacy development in distance learning

The vast majority of the College's students are online distance learners, studying throughout New Zealand and also in other countries, including Australia, Germany, India, the Philippines, the UAE and the UK. Many of the students speak English as an additional language or come from non-traditional backgrounds. To meet such diverse needs and to maintain equitable access to learning materials and staff, the College has created *NZTC Online*, a purpose built LMS for high touch low tech users. This acts as the students' one stop shop for their academic studies, which they are introduced to during a free orientation course prior to commencing their study programmes. ASk101 has recently been added to that system.

ASk101

The ASk101 site within *NZTC Online* harnesses a number of digital technologies to support students in the development of their academic literacy. Content, which is grounded in ECE literature, is provided in: videos, animations with accompanying audio tracks, and traditional textual form which can be downloaded and printed as handouts. Students also have access to interactive quizzes for self-review, practice tasks and guidance about how to arrange face-to-face or phone meetings with the ASk team. The main goals of the resource are to enable easy student access to information and support with academic skills, regardless of geographical location, and for that information to be relevant, understandable and easy to navigate for those students who access it.

The resource was made available to students in August, 2012, with the initial content being:

- An introduction to the ASk team and the services it offers students;
- Guidance on effective academic reading strategies;
- Advice on how to analyse assessment tasks;
- Detailed information on essay writing;

- Guidelines for APA referencing.

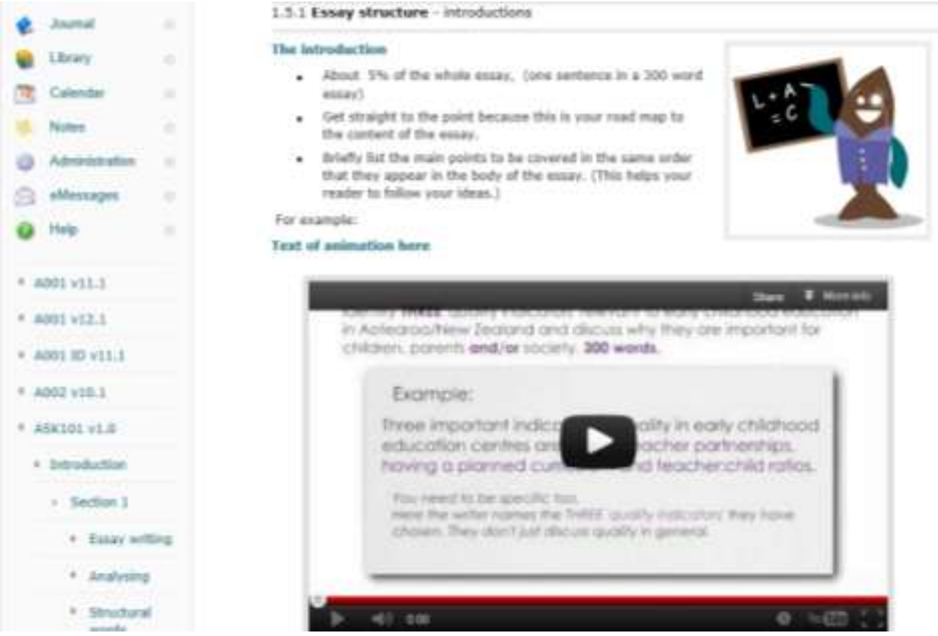

Figure 1: A sample page from the ASk101 essay writing guide

Student response

The response from both staff and students has been positive. Students are able to easily access essential information about how to study and write effectively and have become less anxious about academic work. The ECE student teachers say it is easy to engage with the information because it is ECE contextualised and presented in bite-sized pieces, in both visual and audio formats. Easy access to ASk support and formative feedback on their work has also been a major benefit. And, lecturers are able to direct students, who they have identified as requiring support, to specific aspects of online information and to support staff if needed.

Future directions

Following the initial success of the ASk101 resource, a number of new developments are underway:

- The addition of a “chat” feature, enabling synchronous communication between students and staff;
- Information and advice about plagiarism and practice of how to write with academic honesty;
- Information and advice on literature reviews and developing critical thinking capacities;
- ASk102 – a resource specifically designed for post-graduate ECE students

Analytics and complexity: Learning and leading for the future

Colin Beer
Office of Learning and Teaching
CQUniversity

David Jones
Faculty of Education
University of Southern Queensland

Damien Clark
Office of Learning and Teaching
CQUniversity

There is growing interest in the application of learning analytics to manage, inform and improve learning and teaching within higher education. In particular, learning analytics is seen as enabling data-driven decision making as universities are seeking to respond a range of significant challenges that are reshaping the higher education landscape. Experience over four years with a project exploring the use of learning analytics to improve learning and teaching at a particular university has, however, revealed a much more complex reality that potentially limits the value of some analytics-based strategies. This paper uses this experience with over 80,000 students across three learning management systems, combined with literature from complex adaptive systems and learning analytics to identify the source and nature of these limitations along with a suggested path forward.

Keywords: learning analytics, complex adaptive systems, e-learning, managerialism

Introduction

Higher education is being challenged by uncertainties associated with the need to respond to local and global exigencies. Government scrutiny, government reforms, increased competition and the pace of technological change are impacting on how universities conduct and manage their learning and teaching within this volatile environment. The increasing accessibility and globalization of higher education is also creating problems for universities due to the challenges associated with the increasingly diverse range of students. The management and delivery of learning and teaching is particularly challenging for Australian universities seeking to respond to government targets specified in the Bradley review (Commonwealth Government of Australia, 2008). Achieving the goal of 40% of 25-34 year old Australians with, or progressing to, bachelor degrees will require a significant influx of students from very different cultural, educational, experiential and socio-economic backgrounds.

Universities are increasingly accountable for their learning and teaching by government despite decreased public funding and burgeoning demand (Kenny, 2009; Macfadyen & Dawson, 2010; Nouwens, 2002; Reid, 2009). Consequently, universities are being managed as business or corporate entities where academic activities are managed through strategic control with a focus on outputs that can be quantified and compared (Reid, 2009). This is affirmed by Kenny (2009) who suggests that while universities are aiming to be dynamic and innovative enterprises, many operate under onerous external accountability processes with top-down, corporate management structures. The teleological approach to the management of universities is known as managerialism and its influence has extended to how universities manage their learning and teaching. The prevalence of managerialism in higher education, coupled with the rapid adoption of technologies that support learning and teaching (Ellis, Jarkey, Mahony, Peat, & Sheely, 2007), has given rise to the almost universal adoption of learning management systems (LMS) .

The integration of Internet and communication technology (ICT) into learning and teaching has accelerated in the past decade (Macfadyen & Dawson, 2010). E-learning refers to the use of technologies to support learning and teaching (Ellis, et al., 2007) and is rapidly becoming the dominant delivery mode for distance education. In fact the Bradley review (Commonwealth Government of Australia, 2008) includes “An accessible and sophisticated online learning environment” as one of the 12 components of a quality student experience. E-learning via an LMS provides universities with an unprecedented capacity to control and regulate teaching in order to meet increasing demands for access to higher education (Coates, James, & Baldwin, 2005). This has led to the situation where LMS provide value to institutions by supplying the ability to deliver large-scale online programs in conjunction with the managerial requirements to control and regulate teaching (Coates, et al., 2005; Sawyer, Johnson, & Holub, 2009). However, while there is almost universal adoption of LMS in higher education, it has occurred in a vacuum of research into their learning and teaching effectiveness (Lopes, 2008).

Associated with the ubiquitous adoption of LMS in higher education is their ability to track and store vast amounts of data on student and designer behavior (Heathcoate & Dawson, 2005). The process of analyzing institutional data captured by an LMS and other institutional information systems for decision making and reporting purposes is called academic or learning analytics (J. P. Campbell, Oblinger, & DeBlois, 2007). The use of learning analytics has been shown to be directly relevant to student engagement, evaluating learning activities and can usefully answer other important questions (Dawson, McWilliam, & Tan, 2008). The analysis of LMS captured data has the potential to qualitatively change learning and teaching as it takes advantage of what computers are good at, gathering and sorting data (Black, Dawson, & Priem, 2008). Further to this, it has been suggested that academic analytics has the potential to improve learning, teaching and student success through an awareness of patterns in the data and the application of predictive modeling techniques (J. P. Campbell, et al., 2007). Learning analytics talks strongly to managerialism due to its potential to facilitate data-driven decision-making and to complement existing institutional business intelligence areas. This is evidenced by the practice of situating learning analytics within existing business intelligence units who are typically tasked with providing institutions with strategic information based on retrospective student data.

Insight gained over the last four years exploring learning analytics at one university suggest that the assumptions embodied by managerialism may be an inappropriate foundation for the application of learning analytics into tertiary learning environments. It appears likely that any such application will place significant limits on the potential uses of learning analytics to inform and improve learning and teaching. This paper starts by exploring the hidden complexity behind some simple examples of learning analytics and highlights some dangers presented by the hidden complexity when applying a managerialistic mindset. The paper also examines the managerialistic perspectives with the intent of demonstrating their limitations when associated with learning analytics. The paper then describes complex adaptive systems as a theoretical perspective that may be more appropriate for the task of applying learning analytics. Finally, some implications for learning analytics work that arises from a complex adaptive system perspective, identifies some ideas for future work and draws some conclusions.

The hidden complexity behind simple patterns

Since 2007, the Indicators project at CQUniversity has explored the use of learning analytics to better understand what is happening within CQUniversity's e-learning environments. The project has been able to draw upon the accumulated data from three learning management systems and over 80,000 individual students across over 11,000 course offerings. The project has investigated a range of correlations within the data, such as staff adoption of LMS features over time (Beer, Jones, & Clark, 2009), student engagement (Beer, Clark, & Jones, 2010) and the effect that staff engagement has on student engagement (Clark, Beer, & Jones, 2010). One example of this early work has been the exploration of the relationship between student use of the LMS and their resulting grades. The following chart shows the relationship between student forum contributions and their resulting grades for over 30,000 distance students using the Moodle LMS.

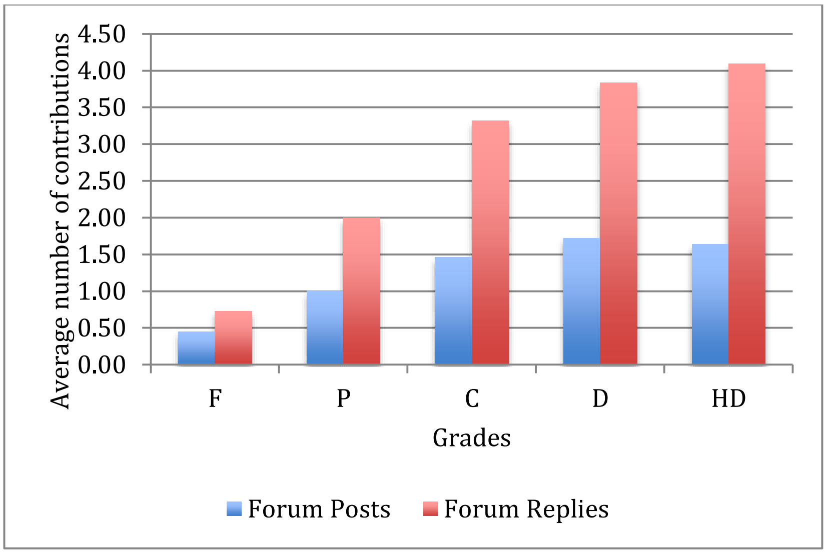

Figure 1. Average forum posts and replies grouped by grade

Figure 1 shows the average number of student forum posts and replies for each grade grouping for distance students using the CQUniversity Moodle LMS since term 2, 2009. On the surface, the linear trend in Figure 1 would indicate that, on average, the more students engage in discussion on the Moodle discussion forums, the better their resulting grade. The 6453 students who received a fail grade averaged 0.4 forum posts and 0.7 forum replies, while the 5693 high distinction students averaged 1.6 forum posts and 4.1 forum replies. This appears to align with Macfadyen & Dawson (2010) who suggested that student contribution to discussion forums was significant in terms of predicting their success in a biology course. However, a danger exists where the interpretation of such patterns and the associated development of institutional interventions, is oversimplified without regard to the complexity occurring within individual courses and programs. The following figure exemplifies the underlying complexity that is occurring within individual courses.

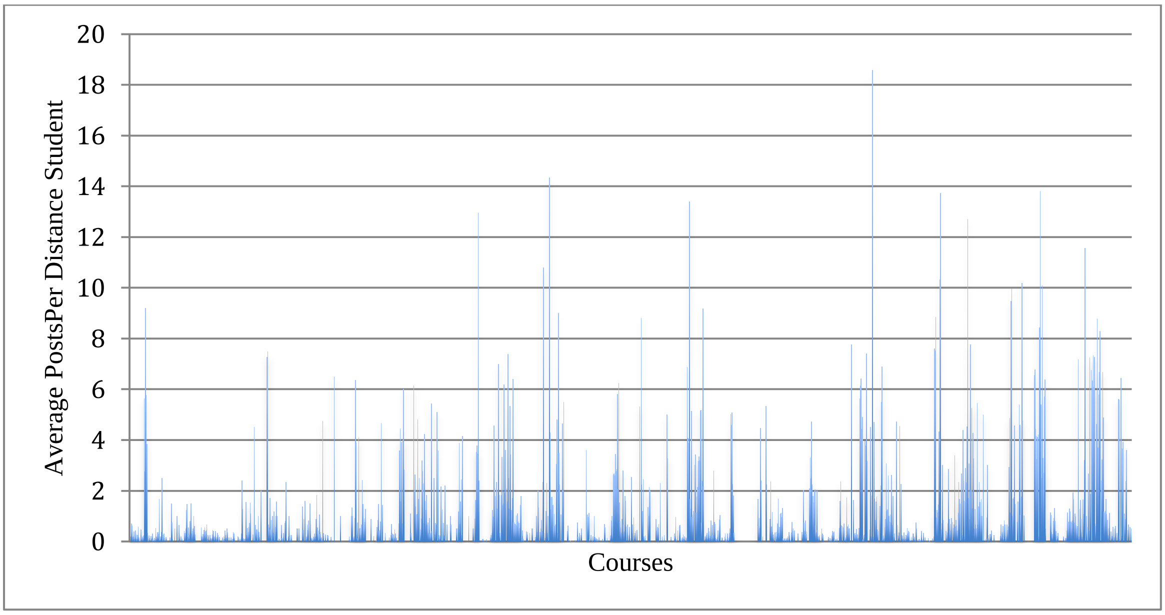

Figure 2. Average distance student forum posts across 1441 courses in 2010 and 2011.

Figure 2 is showing the average number of posts made by distance students across 1441 Moodle courses at the university during 2010 and 2011. The inherent variation is indicative of the plethora of factors that influence how staff and students are using the Moodle discussion forums. Factors such as differing educational philosophies, staff and student familiarity with the technologies, staff and student educational backgrounds, course design, the teacher’s conception of learning and teaching, the level and discipline of the course, institutional policies and processes are just some of the factors that are contributing to the variation apparent in

Figure 2. While learning analytics provides an unprecedented opportunity to observe how staff and students are using the LMS, associated interpretations and interventions need to be carefully considered due to the underlying complexity of the learning environment. This is of particular concern when considered in parallel with the teleological management approaches that are prevalent in modern universities.

Symptoms of the simplistic

As a result of decreasing public funding, universities are increasingly managed by their leaders as if they were businesses in a competitive marketplace. In most universities, accountability for the use of public funding requires both rational allocation of resources and intentional management of change (Russell, 2009). Correspondingly there is a reduction in diversity brought about by this rational allocation of resources (Andriani, 2001). The modernist, teleological manner of university operation also requires that they follow a purpose driven approach to strategic direction (McConachie, Danaher, Luck, & Jones, 2005) which requires goals and objectives to be centrally set and achieved (Lucas, 1996). This teleological approach perhaps links with the rapid adoption of LMS in that they provide universities with an orderly mechanism for control over their online learning strategy and direction (Coates, et al., 2005). A key problem arising from teleological management approaches of learning environments is the assumption that the system's behavior is stable and predictable (Lucas, 1996). Universities and their learning environments on the other hand, have been described as "supercomplex" (Barnett, 2000).

As an example of the tension between managerialism and the complex nature of learning and teaching, in 2009 CQUniversity adopted Moodle as its single LMS. Associated with the adoption of the new LMS and recognition of the importance of student engagement, a set of minimum service standards for course delivery were adopted to guide the course design and planning processes (Tickle, Muldoon, & Tennent, 2009). These standards mandated that every course offer a space for spontaneous student interactions that, within Moodle, was primarily facilitated using discussion forums. However, of 1252 Moodle courses delivered during 2010, 39% had less than five forum contributions by either staff or students. This would suggest that the organizational goal of promoting staff and student interaction within the LMS discussion forums through the teleological imposition of minimum standards has failed to a degree. A factor contributing to this failure is an incorrect assumption by the organization that the underlying system is causal in nature, and the effect of interventions like these minimum standards are predictable and linear.

Organizational leadership has been strongly influenced by Newton's "clockwork universe" where the belief is that big problems can be broken down into smaller ones and solved through rational deduction (Plsek & Greenhalgh, 2001). The "machine model" of organizations lets us down badly when no part of the equation is constant, independent or predictable (Plsek & Greenhalgh, 2001). Universities fit the definition of a complex system where the plethora of interacting and interdependent agents and structures includes teachers, students, community stakeholders, community leaders, the state and its education departments, economic structures, technologies, business organizations and so on (Mason, 2008a). Furthermore, complex systems like universities are unlike simple systems in that they consist of very large numbers of constituent elements or agents that that are connected to, and are interacting with each other in many different ways (Mason, 2008b).

Complex systems, such as university learning environments, are open to and interact with their environment, which includes other complex systems (Jordan, 2010). This can lead to problems if they are managed as simple systems. Snowden and Boone (2007) suggest that different management approaches are needed based on the system type. With simple systems, cause and effect are evident and this means best practice can be applied. Complex systems are not causal, patterns are emergent and there exists no single correct solution. Managing complex systems requires an evolutionary approach as small changes can have disproportionate and non-linear consequences. Applying decision making processes appropriate for one particular system type to another, will lead to problems. Similarly, using learning analytics as if a university is a simple context will lead to limitations and problems.

Problems and limitations of the simple to the complex

Using insights from complex adaptive systems and experience over four years with learning analytics, it is possible to identify a number of likely problems that could arise when the implementation of learning analytics is simplistically applied within a complex context like a university. Some of the likely problems, based on the experience of the Indicators project, are summarized below.

- The hidden complexity behind simple patterns

- Abstraction losing detail
- Organizational decomposition preventing action

- It is not a causal system
    - Confusion between correlation and causation
    - An assumption of causality

Abstraction losing detail

Gardner Campbell (2012) suggested during his presentation to the Learning Analytics and Knowledge Conference 2012, that the nature of learning analytics and its reliance on abstracting patterns or relationships from data has a tendency to hide the complexity of reality. This is exemplified in Figure 2 that shows the variation in student posts and replies and shows an underlying complexity that is not apparent in the linear relationship suggested by Figure 1. This hidden complexity is particularly profound when the data is used for decision making by people who are not directly engaged in the reality (G. Campbell, 2012) and this aligns with complexity science which suggests “bottom up” and emergent change in complex environments (Palmberg, 2009). A 2010 study that used learning analytics to analyze the patterns of particular teacher’s behavior within an LMS, found widely varying results across three courses which were all located within a single discipline and were all delivered by a single academic (Clark, et al., 2010). So even though the three courses were within a single degree program and were delivered by the same teaching academic, the variation noted would have made decisions based on learning analytics information difficult by someone divorced from the context.

Decomposition difficulties

The concept of universities and their associated learning and teaching environments as complex systems appears to conflict with typical university organisational structures and teleological management approaches, where it is assumed that organizational performance is a direct product of rational, macro-level control from above (Goldspink, 2007). This creates a fundamental problem for those seeking to draw upon learning analytics to improve online learning and teaching across an institution, as organizational structures are often representative of teleological thinking. The organization’s structures are rationally decomposed into specialized units with rigid command and control processes, and limited scope for cross unit interaction.

As mentioned previously, the LMS is most often central to online learning within universities and responsibility for the installation, maintenance and support of these systems typically falls to the information technology areas. LMS are learning and teaching systems under the control of IT departments who often have little or no knowledge of their pedagogical application to learning and teaching. Conversely and equally typical, academics and their learning support areas are often bereft of information technology expertise and have little or no technical knowledge of enterprise systems such as an LMS. Consequently, these areas are often segregated within the organizational structure and this can constrain knowledge sharing and cooperation between the areas. Learning analytics, for example, requires significant interaction and collaboration between the information technology areas and the other organisational areas that interpret and act upon the information it provides. This is one simple example of how institutional knowledge sharing can be constrained by rigid organizational structures.

An example of this is the experience of the Indicators project researchers at CQUniversity who required access to the databases associated with the current Moodle LMS and the Blackboard LMS it replaced, in order to explore the potential of learning analytics. As the LMS is the responsibility of the Information Technology Department (IT) and the Indicators researchers were in a different organizational unit, access to data was made difficult due to the overarching organizational structure. A number of questioned were raised when non-IT people requested access to data for the first time. Who owns the LMS data, who should be able to access the data and how will the data be accessed were some of the issues that had to be negotiated in order to instigate a learning analytics project. The decomposed conceptual model of organizations is based on the assumption that the system is like a machine with replaceable parts and predictability can be inferred based on historical performance data (Boustani et al., 2010). Causation in learning and teaching is far more complex as outcomes are not determined by single causes but by multiple causes which means the system is fundamentally unpredictable (Mason, 2008b). This presents a problem as rigid organizational structures inhibit the cross-unit cooperation and collaboration required to adapt and respond to needs an evolving learning and teaching paradigm.

This highlights another potential issue associated with decomposed organizational structures. That is the increasing tendency for universities to have business intelligence areas based in IT that are responsible for developing “dashboards” that give insight into the strategic data. A danger exists where learning analytics is incorporated into these “dashboards” simply to fit the organizational structure. While the strategic data that the “dashboards” provide is important, it could be argued that learning analytics data is tactical data that needs to be located where the students and teachers are interacting. In most universities with online students, the interaction point will most likely be the LMS and not the institution dashboard.

Confusion between correlation and causation

The maxim “correlation does not equal causation” is probably familiar to all researchers. This maxim becomes something more fundamental in complex adaptive systems (CAS) as they are not causal systems. Observed patterns within a CAS may be different next time due to small and unpredictable variations in agent behavior. Correlations arising from learning analytics projects are relatively easily measured which fits current organizational paradigms that value efficiency and compliance (Kenny, 2009). A danger exists where correlation may be interpreted as a universal constant despite the complex nature of the system and this can lead to problems similar to those experienced in health systems, where attempts to rigidly control complex systems worsens the targeted problems and leads to unintended negative consequences (Boustani, et al., 2010).

Earlier, Figure 1 showed a distinct correlation between student participation in LMS forum discussion and their resulting grade. Figure 2 demonstrated significant variations in the way that discussion forums were used between courses indicating that the correlation shown in Figure 1 might be sheltering some underlying complexity. The following figure further points towards the problems caused when the worldview underpinning the adoption of learning analytics is based on causation.

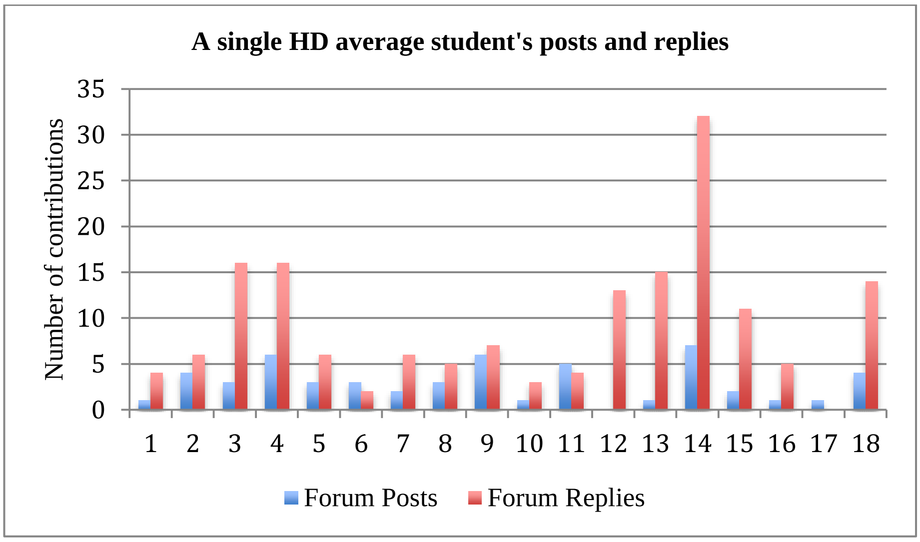

Figure 3. Forum participation for a single student across a degree program

The student represented in Figure 3 has received high distinctions for all of their courses. Figure 3 highlights the large variation in the number of discussion forum posts and replies that a specific student makes across their courses. While Figure 1 showed a correlation between discussion forum participation and student success across a large student population, Figures 2 and 3 suggests that this is may not be a universal constant. Each course is different both in pedagogical intent and in the way that different teachers service their courses. Additionally each student will exhibit different patterns of behavior within each course based on a range of variables internal and external to the student. This aligns with the definition of complex adaptive systems that are comprised of semi-autonomous individuals who interact in non-linear ways while faced with internal and external stressors (Boustani, et al., 2010).

An assumption of causality

The previous section showed the danger of confusing correlation with causation in the interpretation of learning analytics data. However, a broader problem may be the tendency for management to assume causality (D. Snowden & Stanbridge, 2004). The often cited, and somewhat facetious example is if the CEO of a successful company plays golf, then there is a causal link between the company’s success and the CEO playing golf. Of course this is not the case as the reality is vastly more complex. However we can see elements of this basic error in logic in the ways that companies approach best practice and organizational structure (D. Snowden &

Stanbridge, 2004). The danger for learning analytics is if the correlations exposed by the data are seen as causative or universal constants, and this leads to strategic decision-making that assumes the data is reproducible. An example might be where learning analytics information is used as a performance indicator by the organisation. We noted something similar previously in the example where management mandated the presence of LMS discussion forums across all courses to promote staff and student interaction. While arguably a noble goal, it seemingly failed as 39% of the courses had less than five forum contributions.

Complex adaptive systems: An alternative lens

Complex adaptive systems (CAS) are a variation on complex systems and have been described as systems that involve many components that adapt, learn or change as they interact (Holland, 2006). Each agent within a CAS is nested within other systems, all evolving together and interacting so that we cannot understand any of the agents or systems without reference to the others (Plsek & Greenhalgh, 2001). Changes in outcomes from a CAS are not proportional to changes in input, as the interacting systems behave in non-linear fashions (Shiell, Hawe, & Gold, 2008). In summary, Boustani (2010) postulated:

> A CAS is a dynamic network of semiautonomous, competing and collaborating individuals who interact and coevolve in nonlinear ways with their surrounding environment. These interactions lead to various webs of relationships that influence the system's performance.

In order to harness learning analytics for the betterment of an institution's learning and teaching, interventions will be required based on the information provided by the learning analytics. Associated with complex adaptive systems are the difficulties involved with making interventions within systems bereft of causal relationships. Interventions implemented in complex systems are likely to have diverse, far-reaching, unpredictable and non-linear effects (Shiell, et al., 2008). The potentially disproportionate ramification of interventions made within a complex system is known colloquially as "the butterfly effect" and can inhibit the predictability of outcomes arising from the intervention. Goldspink (2007) suggested that change within the complex system should come from the 'inside out' and that micro-level interventions are to be preferred to macro-level interventions or system-wide prescription due to the potential for disproportionate ramifications. This raises some questions about the teleological management of learning and teaching and even the deep-root assumptions about teaching that are based on causality and independence (Davis & Sumara, 2007). From a learning analytics perspective, it begs the question about where, and who within the organization is best placed to receive and respond to the information it provides.

Implications for learning analytics

It has been said that learning analytics can improve learning, teaching and student success through an awareness of patterns in the data and the application of predictive modeling techniques (J. P. Campbell, et al., 2007). As touched on previously, there is a danger that within the current organizational management paradigm, learning analytics results will be interpreted as universal constants by which decree and regulation will be applied to meet the organization's goals. Considering learning analytics as indicators resulting from the activity occurring within a CAS enables us to evaluate and respond to the realities of the present rather than target an idealistic future state. So while macro-level learning analytics can help describe historical contexts, such as how LMS features usage evolves over time, the inherent complexity in behavior by agents within the system make predictions and statistical modeling difficult and cautions a more evolutionary approach to implementation. The traditional scientific perspective that predictability arises from combining a law with a set of initial starting conditions to deduce an outcome (Hempel, 1966), cannot be applied due to the continuing evolution and interactions of agents within a CAS.

Agent behavior within a CAS is emergent and based on a context that evolves according to the interactions of agents within the CAS (Jansen, Cammock, & Conner, 2011). The behavior patterns of agents within a CAS change exponentially and unpredictably as they interact and adapt and this stands in contrast with causal systems where change is linear and predictable (Mason, 2008b). The inherent unpredictability of agents within a CAS suggest that the most appropriate place to situate learning analytics tools and resources designed to inform and improve online learning and teaching, would be within the micro-level context. In the university context this would appear to be at the course level where the various agents are interacting and adapting. This allows the agents interacting within the complex system to evaluate the significance of the learning analytics information based on their knowledge of the context. In the case of a typical LMS delivered university course, the agents who are interacting and adapting are the teachers and students and the CAS perspective suggests that these people are the most appropriate recipients of learning analytics information.

While it could be argued that providing learning analytics derived insights to students is important (Purdue University, 2009), it's likely to be the teacher who has the right mix of closeness and expertise with the learning context. This is especially pertinent given the decomposed organizational models in higher education have contributed to development of information silos that constrain the teacher's access to data. Not to mention the fact that teacher engagement with students in web-based learning environments is perhaps the number one factor in any discussion around improving learning and teaching (Fresen, 2007; Radloff, 2008). Additionally, it is not unusual for the teacher to be responsible for the design and delivery of LMS courses. This well positions the teacher to respond to situations that emerge as a result of what is transpiring within the course's context. For example, the teacher may notice questions about a particular concept within the discussion forums, and can respond by adding a resource that explains the concept in more detail. An example involving learning analytics might be that the teacher is notified that a student has not accessed the LMS course site at the end of week one, and also failed an important preceding course last term. The learning analytics application is linked to the LMS and the student administration system and brings this student's situation to the teacher's attention so that an intervention can be facilitated and monitored.

Conclusions

This paper is an initial attempt to consider learning analytics against a backdrop of complexity science and more research is required to fully realize its potential. It has suggested that there are going to be limitations for institutions attempting to use learning analytics to inform and improve their learning and teaching due to teleological management approaches and corporate structures and the complex, diverse behaviors of agents within online learning and teaching systems. These limitations stem from organizational silos that constrain knowledge sharing and collaboration as well as a fundamental misalignment between the nature of the university learning and teaching and the way that it is managed.

This paper also provided some insight into potential problems for learning analytics implementation based on over four years experience with learning analytics at a particular institution. These included the hidden complexity behind learning analytics data where abstract representations and interpretations can veil the complexity of behavior occurring within the learning environments. The paper also looked at decomposed organizational models and how this can present problems with the interpretation of learning analytics data and associated responses. It was also suggested that learning analytics is data that stems from a non-causal system where the assumptions of causation and confusion between correlation and causation may cause problems for organizations seeking to gain advantage through the use of learning analytics.

This paper suggests that complexity science and in particular, complex adaptive systems might provide a more appropriate lens by which to consider learning analytics, if the goal is to inform and improve learning and teaching. Complex adaptive systems exhibit apparent order at the macro-level despite the vast diversity of behaviors exhibited at the micro-levels. Complex adaptive systems are about emergence and evolution, which contrasts with teleological management approaches based on targeting idealistic future states through strategic goals and visions.

Many would agree with the notion that learning and teaching environments are complex and require different management approaches. Complex adaptive systems theory provides a lens that allows us to sense and respond to the variety of data that learning analytics provides. While there may be the potential for learning analytics to conflict with management approaches based on reductionist thinking, there exists an opportunity to provide students and educators with an unprecedented view of what is transpiring within their learning environments. While some might argue that the application and presentation of learning analytics needs to be simplified, perhaps it should be "complexified".

The challenge for static online resources: The future is dynamic

Lynn Berry
University of Canberra

More universities are providing online courses in response to demands for greater flexibility which consequently places pressure on learning support services, such as, academic skills centres, to follow suit. The increasing numbers of students are stretching the existing capacities of such centres to adequately address student learning needs in traditional ways, and therefore more flexible offerings through an e-learning environment are required. Nonetheless developing online resources and learning activities require significant development time, and it is not clear whether these resources are effective, since very little research examines what or how learning may be achieved. To explore this issue, this paper reviews the available literature on the topic with the aim of identifying ways to evaluate such resources, and considers the sustainability of pursuing static texts. The paper proposes combining knowledge of best practice with an evaluation research framework, and urges the design of more dynamic resources.

Keywords: online resources, effectiveness, pedagogical usability, evaluation framework

Context

Most universities have academic skills centres, often referred to as Academic Language and Learning (ALL) centres, with sites dedicated to providing academic skills information to students. The information typically applies to the development of writing, thinking, researching, and speaking skills in the sense of what is X and how to do X. The information may be packaged as downloadable documents, or presented as online tutorials, podcasts, or videos. Over the last five years, some sites have changed from being repositories for information to addressing student engagement through interactivity. Leslie-McCarthy and Tutty (2011) claim that ALL sites 'have a more complex context and broader scope than is the case for a course-based online learning site' (p. A-24) because of the different purposes and audiences. Their study of ALL sites in Australia revealed that the main purpose of such sites is to provide resources to students. Other purposes include an administrative function, a marketing function (telling people about the centre) and serving the needs of academics (Leslie-McCarthy & Tutty, 2011). As part of the same study, ALL practitioners were asked who used their sites, and two thirds of those surveyed did not know exactly. This highlights gaps in our knowledge about users. Other gaps exist, including a lack of information regarding the usefulness of resources for learning, and if students were able to find answers to their questions. Overall then, it appears that resources are developed for a broad student cohort without clear evidence regarding effectiveness.

Typically, the effectiveness of learning within a particular course is measured by student performance. However, this is not a measure for evaluating the learning effectiveness of material on ALL sites, mainly because of the general nature of the material. In contrast, a course has a set of learning outcomes, and assessments which measure the success in achieving those outcomes. Other factors, such as, student motivation in learning content and improving performance for a course are very different from the motivation in accessing ALL sites for generic skills assistance. Nonetheless, as some library studies have shown, it is possible to evaluate resources through surveys, focus groups and interviews (Blummer & Kritskaya, 2009). University libraries have sites similar to ALL sites in that there are generic resources provided for skill development, and much effort is required in creating the resources. Other information is available that could help guide the creation of resources for online consumption that include the concepts of usability (does it function as it is supposed to?), and evaluation guided by good teaching principles in higher education (Ramsden, 2003). It is possible that since these methods require resourcing, little evaluation of ALL resources has occurred. However, without evaluation, there is no knowledge about their effectiveness.

Literature review

Reviewing the literature reveals a complexity in terminology and approaches to evaluating the pedagogical effectiveness of online sites. This is due to the changing nature of the area, the diverse range of disciplines and backgrounds, and therefore the different interpretations of researchers. The intersection of a number of disciplines has resulted in the development of a variety of e-learning frameworks incorporating website usability, human-computer interaction, instructional design and pedagogy each with different emphases, interpretations and methodologies. As an example, the various terms for online resources include: digital learning material, web-based learning tools/resources/materials, and learning objects. It is also the name of the environment to which they relate that varies, sometimes called online learning environment, e-learning, web learning, communication and information technologies, virtual learning environment, technology-based learning. Sometimes an online resource is also a learning system. Following Phillips, McNaught and Kennedy (2012), the term e-learning is used here which Littlejohn and Pegler (2007, p. 15) define as 'the process of learning and teaching with computers and other associated technologies, particularly through the use of the Internet'.

In higher education, courses are often evaluated using student performance and peer review, while websites are typically evaluated through usability studies. For an e-learning site, these evaluation types are combined, which has given rise to the term pedagogical usability. 'Pedagogical usability is used to denote whether the tools, content, interface and tasks of the online environment support learners to learn in various learning contexts according to selected pedagogical objectives' (Cuturic 2011, p. 26). Pedagogical usability developed by Nokelainen (2006, cited in Hadjerrouit, 2010) expanded usability to account for learning and usefulness of educational software. Using a set of ten criteria, this expanded on the traditional concept of website usability which has focused more on technical and navigational elements as highlighted by usability expert, Jakob Nielsen, among others. The aim of conventional usability is to reduce any potential for increased cognitive load when using software without diverting attention unnecessarily. Cognitive load is minimized when there is consistency, small number of user actions, minimal memory load, and reduction of complexity (Hadjerrouit, 2010). Hadjerrouit (2010) further expanded the criteria for pedagogical usability. A number of other approaches using the term pedagogical usability include Muir, Shield, and Kukulska-Hulme (2003), with two different approaches reviewed in Zaharias and Koutsabasis (2012), and others mentioned in Jeffels (2011).

For the novice, the field can be confusing, particularly since little information is given about the type of research or disciplinary approach. Citing Conole and Oliver (2007) and Friesen (2007), Phillips, McNaught and Kennedy (2012) classify e-learning research into four types: pedagogical, organisational, technical and socio-cultural acknowledging that there are overlaps of the types. From this perspective, pedagogical usability combines both technical and pedagogical aspects, but to evaluate the effectiveness of resources, the emphasis may be better placed on pedagogy. This is indeed the emphasis in the framework proposed by Phillips, McNaught and Kennedy (2012) which consists of the learning environment (including curriculum design, the learning design and the design of any e-learning artefact, such as, a learning management system, computer games or a single learning activity), learning processes (the ways or how learning may occur), and learning outcomes. Their framework, also known as LEPO, is concerned mainly with pedagogy taking a holistic view of learning environments and the way tools are used to enhance their effectiveness.

Phillips, McNaught and Kennedy (2012) acknowledge that any e-learning artefact needs to be designed and undergo the appropriate design process. This process is a design-based research approach that analyses problems, develops solutions, and evaluates these through iterations of testing and refinement. Reflection and feedback help to improve the design principles. This process is similar to the plan, act, reflect cycle that is the core of reflective practice used in education environments, and it is also similar to iterative usability approaches. Figure 1. below illustrates the process.

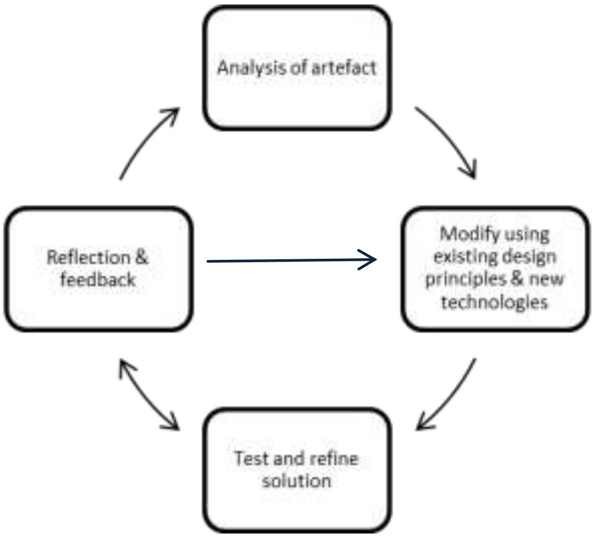

Figure 1: Design life cycle for existing e-learning artefact (modified from Reeves, 2006)

The LEPO framework appears to focus more on learning in comparison to some other models since key learning factors, that is, learning process and learning outcomes, form the foundation of the framework (Phillips, McNaught and Kennedy, 2012). The LEPO framework is broader and contextualises learning using clarity in terminology for processes, products and outcomes, as well as clarity about the framework itself. Another benefit of the framework is that it is a pragmatic model allowing for other approaches in evaluating and researching the effectiveness of e-learning artefacts from a pedagogical perspective, recognising that some are more appropriate than others, depending on the item being evaluated or the research question. In sum, trialling this framework and following the evaluation research design life cycle approach is recommended.

There are some factors around usability and e-learning that is already known and can be utilized. For instance there is information from website usability studies about how people read online, or about navigation. Recent eye-tracking studies (Rakoczi, 2010) highlight the importance of the structure of teaching materials. This is confirmed by readability analyses (Lim, 2010) and focus group feedback (Bowles-Terry, Hensley & Hinchliffe, 2010; Nagra & Coiffe, 2010). We also know that students in general want flexibility, and that they have less study time available than ten years ago (Crisp et al., 2009). All this information can be used to ensure that as much as possible the e-learning environment and associated artefacts address needs and satisfy known criteria, so that the focus is on the learning outcomes or on the specific question to address. The next step is to evaluate using data collected from a range of sources, since it is known that this improves the quality of information. For example, to determine if resources are working as designed and meet the needs of users, data from observations and interviews, among other sources, provide the depth that is missing from surveys. An example of a possible evaluation matrix for an evaluation is given in Table 1. Other information from studies on library resources could help to inform the design of the evaluation or the set of guidelines.

Table 1: Evaluation matrix for e-learning artefacts (modified from Phillips, McNaught & Gregor, 2012)

Criteria	**Data sources**					
	activities	*interviews*	*surveys*	*observation*	*usage logs*	*think aloud*
Evidence of learning	x	x				
Influence of environment on learner's engagement				x	x	
Behaviour of learners if artefact was designed to be engaging				x	x	x
How is the artefact being used?				x	x	
How useful is the artefact?		x	x			

The findings of evaluations can be used in refining the design of artefacts. The question is whether this is enough given the generic quality of the artefact and the broad range of users, particularly with demand for learner-centred, personalised, flexible as well as authentic, learning materials. Perhaps a more sustainable alternative is to design artefacts that are dynamic, based on a diagnostic to determine learner needs for a specific purpose, for example, the learner has to write an essay, it is the first one she has written, and it is for political science. This could be combined with any feedback from previous assignments, helping to ensure that the information presented is personalised and authentic. Somewhat similar to advanced searching, it would be possible to say what is not wanted as well. Such a dynamic system would require a kind of adaptive technology which exists in search engines and in technologies, such as speech recognition. This could mean that a generic static text could evolve into a context-dependent and learner specific text. Some aspects of evaluation could be automated to collect information that might help refine and improve such texts for the next time.

Conclusion

The challenge for ALL sites is to provide effective resources both now and in the future. Given the nature of e-learning, determining the methods for evaluating online study skills resources can be difficult. However, using a framework for evaluation research where the focus on pedagogy is appropriate due to the focus on learning. In addition, conducting iterative usability analyses will help to refine resources as part of the design process. Supplementing these analyses with data from a range of sources, both quantitative and qualitative, can help determine what is learned and how, and therefore, what is effective. There are questions about the sustainability of designing and evaluating the current static nature of resources, when in fact resources developed dynamically, through diagnostics and sophisticated searching, may lead to more pedagogically effective solutions. Here learning for the future is about adapting content and activities for specific purposes and specific learners.

In this study we explored the nature and types of knowledge that university teachers draw upon when they are making decisions related to the use of Information and Communication Technology (ICT) in their courses. The data were obtained using a 'think aloud' protocol. Shulman's (1987) and Mishra & Koehler's (2006) frameworks were used as an initial basis to classify teachers' knowledge. The mental resource perspective was adopted as a general lens to obtain an insight into the nature of teachers' knowledge. The results showed that teachers' decisions were based on different types of knowledge. When teachers planned to use ICT in their courses, they combined different knowledge types with context-specific experiences and projected situated actions. In this paper we illustrate three qualities of teachers' knowledge that underpinned core teachers' planning decisions: a) the linking role of pedagogical knowledge; b) relational nature of teachers' design thinking; and c) the experiential basis of teachers' anticipations.

Keywords: course planning, ICT integration, university teaching, teachers' knowledge.

Introduction

Planning a university course, especially one that will incorporate Information and Communication Technology (ICT), requires the integration of different types of knowledge. This knowledge, which teachers use during planning, is both wide ranging and diverse (Kreber & Cranton, 2000; Shulman, 1986). In order to make informed decisions about appropriate pedagogical deigns for teaching in a specific context, teachers should be able to fluently switch between, and combine, various types of knowledge and ways of knowing (Goodyear & Markauskaite, 2009). Researchers have attempted to identify the kinds of knowledge that underpins teachers' expertise (Calderhead, 1996; Carter, 1990; Shulman, 1987). For example, Shulman (1987) identified seven types of knowledge which include knowledge about curriculum, general pedagogy, disciplinary content, discipline specific pedagogy, students, and institutional arrangements. He emphasised one specific type of teachers' knowledge - Pedagogical Content Knowledge (PCK) - that teachers should use when considering how specific content could be taught effectively. He noted that PCK could not be dissected into content knowledge and pedagogical knowledge as separate entities, suggesting that some kinds of teachers' knowledge are closely coupled and form distinct areas of expertise.

Teachers are increasingly, and frequently, facing the challenge of integrating technologies into their disciplines and pedagogical repertoire. Mishra and Koehler (2006), extending PCK, suggested that teachers need a specific type of knowledge that they called 'Technological, Pedagogical And Content Knowledge' (TPACK). They emphasised that isolated skills associated with ICT are not sufficient for successful ICT use in teaching. Rather, teachers should be able to consider content, pedagogy and technologies together. Studies on TPACK have investigated broad types of knowledge that emerge at the intersections of content, pedagogy, and technology, as well as additional kinds of knowledge such as those that are associated with learner characteristics and context (Archambault & Barnett, 2010; Yardakul, Odabasi, Kilicer, Coklar, Birinci, & Kurt, 2012). Findings from these studies generally suggested that ICT integration requires teachers to have a strong knowledge base in a variety of areas, such as subject, themes and sub-themes of content, organisation of subject matter, relationships among concepts, pedagogical approaches, techniques and principles, and knowledge of the learners' needs and abilities. The TPACK theoretical framework acknowledges a context dependent nature of teachers' ICT-related knowledge, however, in many empirical studies, TPACK is often regarded as a generic and well-articulated construct; one that could be measured using general self-reported questionnaires with multiple-choice scales.

Further, many studies of TPACK have focused on the kinds of teachers' knowledge that are required for integrating ICT into classroom practice, and relatively few have explored those kinds of knowledge that teachers need for ICT-related planning and design (Angeli & Valanides, 2009; Kadijevich, 2012). Calderhead (1984) emphasised that course design and planning, while often invisible, is an important part of teachers' work and needs to be explored and understood much better. This study is concerned with the nature and types of knowledge associated with this 'hidden' part of teachers' practice. We specifically focused on investigating the knowledge that university teachers draw upon when planning and revising courses before the start of a semester, concentrating on the core decisions made concerning the use of ICT in teaching.

Designing and planning for ICT integration: Teachers' knowledge bases

With the role of ICT and eLearning in higher education increasing, focus has shifted from "teaching-as-interaction" to "teaching-as-design" (Goodyear & Retalis, 2010). Teachers are increasingly engaged with planning and designing 'learning spaces' and tasks (Laurillard, 2012). However, the kinds of knowledge that underpin the teachers-as-designers' practice are still little understood. Shavelson (1976) argued that the decisions teachers make, in planning their instruction, parallel decisions made by instructional designers. Further studies suggested that expertise in teaching and design are both required during course planning and, while they are often integrated, they also remain distinct. For example, some university teachers work in teams with professional e-learning designers when they design e-learning sites (Ward, West, Atkinson & Peat, 2012). Markauskaite, Bachfischer, Goodyear, & Kali, (2011) explored the knowledge bases that such teams draw upon in their collaborative e-learning design process. They found that the teams' knowledge base included TPACK, but also extended it to include design-specific knowledge and teamwork-related skills. Further, other studies showed the nature of teachers' pedagogical knowledge and how teachers ground their ICT-related teaching decisions in experiences and specific contexts (Goodyear & Markauskaite, 2009; Markauskaite & Goodyear, 2009). This suggested that a much closer look at the situated, empirical grounding of teachers' knowledge is needed in order to obtain an insight into the teacher-as-designer expertise. In this study we distinctively focussed on the situated nature and types of knowledge that underpin teachers' planning for ICT integration.

Theoretical framework: Mental resource perspective

We broadly adopted the mental resource perspective (diSessa, 1988; Hammer & Elby, 2002) to investigate the knowledge that teachers draw upon when making ICT-related decisions. In contrast to the more traditional theoretical frameworks of human cognition that see expert conceptual knowledge as well integrated, generally coherent, and abstracted from contexts, the mental resource perspective considers knowledge as more fragmented, sensitive to contexts and comprising various knowledge constructs ranging from small intuitive mental "pieces" to explicit, integrated "coordination classes". These constructs include fine-grained context sensitive knowledge elements that are activated when the situation "feels right". This perspective, therefore, allows us to obtain a more nuanced insight into the nature of the knowledge involved in making specific teaching and planning decisions. In our study we aimed to obtain an insight into the various facets of knowledge that may form the foundations of teachers' TPACK when they design and plan courses. We adopted the TPACK framework to classify types of knowledge, but did not consider each TPACK domain as one generic construct. Rather, we aimed to explore the nature of teachers' knowledge elements at a fine-grained level.

Methodology

The study participants were four university teachers with responsibility to coordinate and teach different subjects to pre-service teachers. Their courses were specifically focused on the application of ICT in teaching and learning. The data were collected using a 'think aloud' method (van Someren, Barnard, & Sandberg, 1994) when teachers were planning and revising their units before the start of a semester. Rather than asking participants to consciously reflect on, and explain, their thoughts, the participants were asked to verbalise their thoughts in real time during their routine course planning. This technique provides the possibility to obtain a closer look at the nature of the knowledge that is called upon during a natural thought process. The planning sessions lasted from 45 minutes to 1 hour; each entire session was video recorded.

Chi's (1997) method for analysing verbal data was used to analyse the 'think aloud' recordings. Initially, the sessions were transcribed verbatim. Then, the transcripts were divided into the utterances, where each utterance formed a coherent unit of meaning. The transcripts were then re-read several times in order establish the meaning of each utterance. This was achieved by taking into account the meaning expressed directly in the statement and also in the surrounding context of the thought process. The utterances were then labelled to identify their content, meaning and relationship to the context. Shulman's (1987) knowledge bases and Mishra

& Koehler's (2006) TPACK categories were used as an initial basis to classify the knowledge elements into types. These were then further refined to take into account the nature of the knowledge, the blends of knowledge that were created, and the relationships between different knowledge types.

Results and Discussion

The initial analysis of the data indicated that the knowledge that teachers used during the planning of their courses is both wide-ranging and diverse. The teachers rarely drew upon individual kinds of knowledge when they made their decisions, but combined and linked different knowledge elements together. In this section we discuss three main qualities of teachers' knowledge that were characteristic of the teachers when they were thinking about their projected use of ICT.

Linking role of pedagogical knowledge

Pedagogical knowledge was prevalent in most of the s' thought processes and decisions. In most situations pedagogical knowledge elements were activated together with other elements, such as knowledge of content, technology, management, and students' learning and assessment. Teachers sometimes combined their knowledge of pedagogy with their knowledge of technology. For example, one teacher described why she needed to allocate time for introducing a wiki by stating *"I really need to give them a better introduction that why to use wiki and what's expected"*. This illustrates that the teacher's focus was on using a wiki, however, she needed to provide students with an explanation of the rationale, which indicated an aspect of her pedagogy that related to her use of ICT in this course. Data also showed that, in some instances, teachers combined more than two knowledge types to take pedagogical decisions. For example, one teacher verbalised, *"I'm thinking to teach fractions in the next week 'cause students 've already developed their knowledge of mathematics, so using just simple learning objects for fractions 'd be a good way to go*". In this episode, the teacher combined her pedagogical knowledge (when to teach) with knowledge of content (fractions), management (in which week to teach), students (what students already know), and TPACK (knowledge about available learning objects for teaching this particular topic). In this episode, as in many other observed situations, teachers appeared to combine various knowledge elements that were firmly linked to specific contexts and situations such as time and specific students.

Relational nature of teachers' design thinking

Data also revealed that each knowledge type consisted of a *variety of sub-types* which, when combined, formed complex, fine-gained relationships. Content knowledge involved further sub-types such as content knowledge of the teachers, relationships between the content and students' learning, the teachers' past experience of the content, and organising the content into different themes and sub-themes to make it accessible to the students. For example, *"In week one eh in week one, our content focus is fractions and I've access to several learning objects that talk about fractions. I'll use one of those in lecture and talk about multiple representations as part of that topic in lecture"*. In this episode, the teacher's focus was primarily on content knowledge - fractions. Simultaneously, she focussed on "multiple representations" that formed fine-grained relationships with each other. Further, she linked content knowledge with her knowledge of the organisation and management (when to teach, and what to demonstrate in lecture) and technological pedagogical content knowledge of the learning objects suitable for teaching the content.

Experiential basis of knowledge

Another finding from the data was that the teachers' made constant reference to their *past experience*. This was present in almost all types of their knowledge, and included past experiences with content, pedagogy, technology, management, and students' learning and assessment. For example, there were many references to content they taught last year, such as,*" Last year I taught them about evolution, using a reading which talks about Darwin but this year I've found another, which is about Darwin and Australia. This sounds really interesting and I want to use it this year 'cause its about Australia not just about Darwin.".* Overall, teachers' past experiences, related to the content, was one of the main inputs for decisions about course redesign. It was related to such aspects as which topic of the content they had taught in past, and whether that content was useful or needed to be changed in order to make it more useful.

Conclusion and Future Directions

The analysis throws light on the nature and types of the knowledge that teachers used during course planning. It indicated how blended forms of knowledge were created through combination of different knowledge types. The findings point to three important qualities of teachers' knowledge upon which they draw making decisions about ICT: a) the dominant and linking role of pedagogical knowledge; b) relational nature of teachers' design thinking; and c) experiential basis of teachers' anticipations.

First, pedagogical knowledge appeared to serve a dominant role when teachers were involved in planning their teaching. Teachers' decisions were often based on small context-sensitive elements of pedagogical knowledge that were linked with other types of knowledge. Second, teachers' knowledge, related to different domains of TPACK (pedagogy, content and technology), did not appear as large units of abstract knowledge. Each knowledge type could be viewed by considering sub-types of knowledge, which were linked to other knowledge types and sub-types in fine-grained, complex and context sensitive ways. Third, in many situations, the teachers drew upon their past experience when making decisions regarding how ICT could be used in their teaching. Teachers' reflections on ICT integration decisions taken in the past, along with the outcomes experienced, were particularly influential; these formed a strong basis for planning future actions.

TPACK theoretical literature often pointed out the relational dynamic nature of teachers' technological knowledge(Mishra & Koehler, 2006). However, a range of empirical studies drew upon unitary conceptualisations teachers' knowledge, and often measured TPACK using inflexible, and little sensitive to the context, general instruments and scales. The findings of this study show that teachers, when they make course planning decisions, simultaneously draw upon, and combine, different kinds of knowledge. The knowledge elements upon which they draw are generally grounded in their experiences and specific contexts. This indicates that teachers' ICT-related knowledge is unlikely to form a generic well-articulated construct (such as TPACK) that can be understood outside specific contexts, experiences and situations. The mental resource perspective (diSessa, 1988; Hammer & Elby, 2002) offers a flexible theoretical and analytical framework for understanding the nature of such knowledge. In our future studies we intend to explore how knowledge elements of various types and sub-types interact and form more coordinated constructs that enable teachers to make decisions that are both fluent and sensitive to the situation.

Learning for the future: Online student evaluation of generic and context-specific library skills tutorials

Ruth Billany
School of Health
Charles Darwin University

Bernadette Royal
Liaison Librarian
Charles Darwin University

Isabelle Lys
School of Environmental and Life Sciences
Charles Darwin University

This paper reports on a project stimulated by two major challenges facing higher education in the twenty-first century; massification and the citizenisation of academies. This empirical study reports on the use of emergent technologies, in the acquisition of information, for diverse cohorts of students enrolled in two scientific subjects (n=47). A generic online library skills tutorial (LST) in one subject is compared to an embedded virtual, context-specific LST in another. Student attitudinal evaluation, both affective and cognitive, was measured by an 18-item online survey. The rich qualia showed a ten-fold difference which adds to a body of knowledge which was reinforced by an objective measure, a graded assignment. As consumers, the students have been valued and voiced their demands. Lecturers and librarians need to lead in this climate of change to develop a creative and emergent, reciprocal non-linear mechanism to build on this trajectory and plan a future for learning.

Keywords: acquisition of information, library skills tutorial, online student evaluation

Background

Two international drivers for future transformational change within contemporary discourse in global higher education are massification and the citizenisation of academies, each of which have national advocates. In parallel, government social and economic objectives drive investment and construction of network infrastructures to offer all citizens high speed connectivity.

Future orientated academics must be cognisant of this phenomenon as tertiary education is no longer perceived as an endeavour of the elite but is being transformed into a universal system designed for the masses (Fisher, 2006). This trend towards education of the masses requires innovative future-orientated solutions. Consistent with Gallagher (2001) who suggests the growth of online learning is inextricably linked to the commodification of knowledge, Holt and Challis (2007) consider decision makers at Universities should respond to contemporary societal demands and become more industry and customer focused. Leading in a climate of change, the hierarchy of this small regional University in Australia made a decision to offer online learning in response to increased economic pressure, to reduce costs. In turn the lecturers, who adhere to social constructivist epistemologies had to develop new pedagogies through projects of digital inclusion.

Australian Universities have also followed the lead of Anglo-American tertiary institutions, which privilege the notion of training future work-ready citizens by embedding generic skills relevant for the new knowledge economy. Generic skills equip a person to achieve their full potential in employment, life and community. They are highly-valued by employers for their role in enhancing the capacity of employees to respond, learn and adapt when workplace demands change. These skills, including information literacy, are developed throughout a person's life and in multiple settings, including work and life settings and educational contexts. According to Blewitt (2010) sustainable and lifelong learning and the attributes graduates should be embedded in undergraduate learning activities (Kennedy & Innes, 2005) which can be facilitated by new technologies.

Thus, academics, in higher education, find themselves located in this complex social reality of a nascent digital culture. They need to conceive of imaginative and innovative responses to future orientated challenges to ensure large, diverse student cohorts are fully prepared to meet the demands of a new knowledge society with respect to information literacy. Lecturers and librarians, in higher education, strive to design 'learning for the future' curricula, and act as facilitators enabling students to become self-regulated learners, with respect to information literacy. According to Cochrane (2006) optimum development and implementation of innovation in teaching and learning are informed by a pedagogical framework which should be based on alignment of interactive learning experiences and authentic assessment tasks that enable student achievement of learning outcomes.

In this study, for the students enrolled in two first year science subjects, the authentic assessment task culminated in a piece of summative academic writing, a research report. To be able to write a research report is considered a generic and transferable skill for a science graduate, as they are learning for the future, and one step to success is for the student to acquire knowledge by developing their information literacy skills. Interactive learning experiences for information literacy are increasingly developed and delivered by expert librarians in generic online packages available on-demand (Wesch, 2009). The benefits of skills specific training delivered by library experts versus general training may impact upon the developing skills of future work ready graduates. This study reports the outcomes of a quasi-experimental study to compare a traditional generic package with a collaborative project between a discipline-specific academic and an expert from the library to deliver information literacy learning experiences to diverse cohorts of students.

Library Skills Tutorial (LST)

The nature of the library and information skills is changing rapidly as technologies emerge. Undergraduates struggle to identify, retrieve and evaluate academically acceptable sources of information in challenging science-based writing assignments (Flaspohler, Rux, & Flaspohler, 2007). This is magnified in a diverse student cohort where some can navigate online with ease whereas others are completely mystified (Martin-Kniep, 2000). Cliff and Hanslo (2009) in South Africa, reinforce the challenges facing the educationally diverse backgrounds of the first-year undergraduate students including the academic reading and writing demands. The massification drive for larger student numbers, with no corresponding increase in staff numbers, have reduced opportunities for formative support (Nicol, 2009) for such a pivotal stage in the learning experience. A further risk manifests for students with poorly developed authorial identity who may be at risk of unintentional plagiarism. Elander, Pittam, Lusher, Fox & Payne (2010) report a beneficial intervention which assisted 364 UK first-year undergraduate psychology students avoid unintentional plagiarism. Flaspohler et al. (2007) report the provision of enhanced library-based instruction to biology students improved their library search capabilities and reduced incidents of plagiarism. The literature presented so far makes a case for the inclusion of library skills instruction to first year science undergraduate students. What follows is a discussion about who should deliver the instruction and an evaluation of the optimum methods of delivery.

First year science students need to locate, access, retrieve and utilise information in an effective and ethical manner and master their genre of academic research report writing. Science lecturers may not have the time nor the expertise to support and mentor students through the process (Strauss, Goodfellow, & Puxley, 2009). In her review of Irish higher education practices McGuinness (2009) reports the use of generic library tours and print based guides, one-off lectures, demonstrations, and possibly hands on laboratory sessions delivered by library specialists to small cohorts, in face-to-face ‘internal mode’. Recently this support has been extended to ‘external mode’ students using communication tools, e.g. asynchronous chat, in an online learning management system. However, university librarians often develop and deliver these library skills sessions in a standalone format, using non-integrated methods. Strauss et al. consider this to be problematic as students require specific background information during this pivotal stage of acquisition of information. Thus librarians should collaborate with academic teaching staff to embed context-specific LSTs. In this study, a traditional online generic LST offered to students enrolled in one science subject will be compared to a compulsory, embedded virtual, context-specific LST in another science subject. Subjective student evaluation of the LSTs and the objective impact of the LST on the student learning experience will be measured.

Subjective Student Evaluation

Tensions between financial imperatives and delivering a quality learning experience continue. As a receiver of publicly raised monies, Universities are required to be more productive and more efficient with concurrent accountability for quality. Fisher (2006) proposes the potential consequence may be ‘a reduction in the experience of learning’ (p. 1) so careful monitoring of the perceived student experience over time will provide data which may refute Fisher’s proposition. Student evaluation should not be seen as a cause of anxiety (Donovan, Mader, & Shinsky, 2010) but as a reliable and valid way to learn from the student experience and improve the learning experience for subsequent cohorts of students.

Researchers in education have used various methods to elicit student evaluation of programs. Hendry, Bromberger and Armstrong (2011) combined focus group discussions with self-report questionnaires derived from their qualitative data. This 'triangulation' or a mixed methods approach ensured rigour and trustworthiness of their findings. Hendry et al.'s research was conducted on campus and Anderson, Cain and Bird (2005) note the benefits of online student evaluations over paper based surveys include time efficiency for academia in terms of deployment and analysis. This method of garnering student evaluation also provides the student with a level of control. Students can chose when to participate and for how long. Accordingly, there are more thoughtful and longer remarks for open-ended questions which provide formative, or useful information for the instructor on what was effective and what should be changed (Donovan et al., 2010). Interestingly, Donovan et al. reported no difference between the quantitative ratings between paper based and online evaluations, despite prior perceptions of a higher percentage of negative responses.

Pragmatically, this study will use online student evaluation to compare the effectiveness of a generic versus a context-specific LST. In their recent review of library instruction and information literacy, Johnson, Sproles and Detmering (2010) list only three journal articles that report student evaluation. An exception is Figa, Bone and Macpherson's (2009) study on faculty-librarian collaboration which reports the use of a student survey. As there appears a dearth of literature and tools for capturing student evaluation of an LST, a unique measuring instrument has been devised to elicit both quantitative and qualitative data. This innovative metric, an 18-item online survey, has been designed to measure student attitudes, their personal beliefs about way of knowing (cognitive) and feeling (affective) in relation to perceived usefulness of the LST outcomes in their future learning. A feedforward approach will be taken in the analysis to inform future iterations of LSTs and enhance the experience for future learners.

Objective Performance

Student attitudinal evaluation, both affective and cognitive, will not be the sole measure of the relative effectiveness of the two LSTs (generic and specific). An objective measure will add to and potentially reinforce the findings reported in the subjective student experience. The learning objectives for the students in both science units included a requirement to write a scientific research report. Two science subjects, at a regional Australian University, have encouraged scientific writing early in undergraduates' academic career to improve their working knowledge of theories, concepts and techniques that are extensively reported in scientific publications (McClure, 2009).

An academic science report relies on prior preparation and the application of the skills learned and practiced in the LST. Students are expected to identify, retrieve and evaluate academically acceptable sources of information which they cite in the 'Introduction' to construct a coherent argument and develop their research hypotheses. Then after the 'Method' and 'Results' section, they should refer again to some of their citations in the 'Discussion'. Finally, they should consolidate all citations in a terminal 'References' list in the appropriate style for the discipline. For an objective measure, the final grade for the submitted research report is assumed to measure the performance of the student in an authentic assessment which incorporates the skills they acquired and practiced during their LST.

Research Aims

Formal student evaluation of information literacy teaching is not commonly carried out in higher education institutions (Johnson et al., 2010; McGuinness, 2009) and the aim of this study is to gather evidence, to inform a bottom-up change initiative, for the redesign of subsequent virtual, context specific LSTs to improve learning for the future, that is, academic writing in first year science students. There appears to be a dearth of research that documents such a specific skill development in the learning cycle in science undergraduates and this research study will add to literature about transforming education through supporting collaboration, connection, and customisation and individualisation of virtual non-linear, creative and emergent digital environments. Thus the significance is to enhance the future learning experience of large cohorts of science students and to ensure work ready graduates with respect to information literacy.

The main aim of this study is to use student evaluation to compare generic versus context-specific library skills tutorials. The primary research hypothesis is 'students receiving a generic library skills tutorial will rate the tutorial lower than students receiving the context-specific library skills tutorial'. A subsidiary aim is to use an objective measure to determine the efficacy of the library skills tutorial offered in each science subject. The secondary research hypothesis is that 'students receiving a generic library skills tutorial will receive a lower grade in the assessment task than students receiving the context-specific library skills tutorial'.

Method

Participants

The study participants (n=47) included all students enrolled in two, first year, science subjects at a regional Australian University that submitted a research report for grading (N=426). Table 1 shows the demographic data for students from each science subject (psychology and anatomy & physiology).

Table 1: Sample Size and Demographic Variables for the two Science Subjects

Variable		Science Subject	
		Psychology	Anatomy & Physiology
Sample	n	28	19
	%	17.4%	7.17%
Age	mean	35.5 y	26.9 y
	SD	12.5 y	9.5 y
Gender	male	17.9%	26.3%
	female	82.1%	73.7%
Mode of study	internal	21.4 %	55.6%
	external	78.6%	44.4%

Design

This mixed methods study is considered to be an independent quasi-experimental design. Independent group allocation was contingent upon the science subject in which they were enrolled. Due to departmental constraints all psychology students (internal and external) received a generic online tutorial, whereas, the internal anatomy & physiology students were exposed to a face-to-face workshop delivered by the librarian. All anatomy & physiology students had access to the enhanced embedded, virtual, context-specific LST designed for the external student cohort, in collaboration with the lecturer. This was a synchronous Collaborate session using the Learning Management System which was archived for subsequent access by both modes of students.

Materials

A survey was specifically designed to measure the students' self-reported attitudes (affective and cognitive) of the effectiveness of the library skills tutorial. The 18-item survey consisted of two sections, a demographic and library skills tutorial evaluation section. Eight demographic items elicited data about the student, including age, gender, course, number of semesters studied, their mode of study and student identification number. The latter item was to enable data linkage with the assessment grade (the objective measure).

Of the remaining 10 evaluative items, one required a response about the duration of the LST. The tutorial lasted for one hour and students were asked if this was appropriate, and if not, what length of time they considered would be adequate. The library skills tutorial scale (LSTScale) consisted of 7-items and elicited specific attitudinal responses to a statement. These were measured on a 5-point Likert scale, thus the sum of LSTScale for an individual respondent would range from a minimum of 7 to a maximum of 35. Cronbach's alpha is an index of consistency or reliability across items constructed to measure a construct. For the 7-item LSTScale alpha = .88 which can be considered adequate for exploratory research purposes.

Within this scale were two subscales. The affective subscale of 3-items provided a measure between 3 and 15. It included statements about their feelings, or confidence levels. The 4-item cognitive subscale might produce a value between 4 and 20. This subscale included statements about their knowledge and understanding. Finally, two open-ended items were included to generate a textual response and were designed to elicit information beyond the scope of the researchers' predictions.

Procedure

Early in a 12 week semester the authentic assessment task, a research report, was set and students were advised to take part in an LST to assist in their academic writing. The assignments were due in week seven, and graded and returned to the student by week 10. The activities described so far were part of the normal student learning experience. In week 11, after obtaining ethical approval from the university human research ethics committee, an invitation was posted in the learning management system for students to access an external website that hosted the confidential survey. This ensured that students had access to link to the site at a time and place of their choosing. This design enhances validity (truthfulness) of responses as they could seek privacy when completing the survey. The ethical issues of informed consent and right to withdraw were taken into account. After reading the information sheet potential participants could choose to continue, skip a question, or withdraw at any time by merely closing their internet browser.

Results

The online survey was available for three weeks at the end of semester and 11% of the target population completed in this time period. The primary research hypothesis relating to subjective student evaluation was tested by examining the outputs from the online survey. The secondary research hypothesis required a comparative analysis of the student grade in the assessment between the science subjects (that is, between the LSTs).

Quantitative Analysis of Subjective Student Evaluation

Regarding student evaluation of the duration of library skills tutorial, 83% *(n = 41)* considered the one-hour library skills tutorial was suitable. The remaining minority requested longer tutorials in future; generic LST *(Mean time = 2.17 hours),* and context-specific LST *(Mean time = 2 hours).* Descriptive analysis is presented in Table 2. For inferential analysis, non-parametric tests for mean difference (*Mann Whiney U*) were conducted as the samples were not normally distributed. There were differences, but these were non-significant differences, for the main LSTScale and both the affective and the cognitive subscales. The generic LST group rated each measure lower than the context-specific LST group.

Table 2: The measure values, mean, standard deviation and range for each LST group

Measures	Range for Value	Generic LST			Context-Specific LST		
		Mean	SD	Range	Mean	SD	Range
LST Scale	7 to 35	24.9	4.7	13-32	27.4	4.1	16-29
Affective subscale	3 to 15	10.8	2.2	5-14	11.7	2.0	7-15
Cognitive subscale	4 to 20	14.1	2.9	7-18	15.6	2.5	8-20

Scrutiny at the item level showed significant differences for two cognitive self-report items between students in the two LST groups. The item ratings for *'I understand what is considered appropriate evidence in my subject'* for the generic LST group (*Mean Rank = 19.82, n =28*) were significantly lower than those from the context-specific LST group (*Mean Rank = 29.22, n =18*). *U = 149.00, z = -2.547, p = .011,* two tailed. This effect (r = .38) can be described as 'medium' (Cohen, 1988). Similarly, the ratings for the item *'I know how to evaluate the quality of a book or journal article or internet source'* for students in the generic LST group (*Mean Rank = 20.27, n =28*) were significantly lower than those in the context-specific LST group (*Mean Rank = 28.53, n =18*). *U = 161.50, z = -2.291, p = .022,* two tailed, also a 'medium' effect (r = .34).

A *post-hoc* analysis reveals an interesting mode of study effect. A Mann-Whitney *U* test indicated that the library tutorial ratings by 'internal' students (*Mean Rank = 31.25, n =16*) were significantly higher than those of the 'external' students (*Mean Rank = 18.45, n =29*). *U = 100.00, z = -3.147, p = .002,* two tailed, with a medium effect size (r = .47).

Qualitative Analysis of Subjective Student Evaluation

Sixty percent of respondents chose to add a textual statement into one or both of the open-field items to provide a rich evaluation about the library skills tutorial. The length of these statements ranged from four to 136 words *(Mean = 44.6; SD = 43.5 words).* Phrases were read and reread and classified into four mutually exclusive categories, the mean values and an exemplar for each category are shown in Table 3. There was some variability within respondents, but not between the different LST groups, except for negative statements.

Table 3: Category Mean Phrase Value for each LST group and Qualitative Exemplars

Category	Exemplar	Mean Phrase Value	
		Generic LST	Context-Specific LST
positive	*try out skills ... in the process of learning them*	1.9	2.1
negative	*I just found I was getting confused*	**0.9**	**0.1**
formative	*... make relevant to particular study*	0.9	0.8
summative	*I think it is quite comprehensive*	0.4	0.3

Content analysis at the phrase level for the LST groups, enabled the determination of two ratios. Firstly, the ratio of positive to negative comments, which revealed a large ten-fold difference between the two LST groups; generic ($\text{ratio}_{pos:neg}$ = 2.11), and context-specific ($\text{ratio}_{pos:neg}$ = 21). Secondly, the ratio of formative to summative comments did not show such a difference; generic ($\text{ratio}_{form:sum}$ = 2.25); context-specific ($\text{ratio}_{form:sum}$ = 2.67).

A thematic analysis of the two most useful feedforward categories (positive and formative) follows. Three emergent themes from the positive category include statements related to the delivery style, content and how the student felt supported in their present and potential future skills related to information literacy. Phrase exemplars below derive mainly from the context-specific group. The style of delivery theme is represented by: *concise; step-by-step; use of simple English; easy to use; easy to understand; and, collaboration sessions were good to be able to hear what problems other students may have*. Content phrases are exemplified by: *summon search database very useful; information on detecting bias; examples of referencing styles; and, kept relevant to anatomy & physiology*. Perceived support statements included: *helps learn how to find quality references in an efficient way; gave me an ability to research and collate material properly; online delivery which enabled you to try out skills as you were in the process of learning them; during the tutorial, I managed to get 2-3 sources already - which I had used in my final report; allowed student contributions; own pace; and, [future] help was available if needed.*

Thematic analysis of the formative category reveals two themes; delivery style and content, relevant to feedforward. The representative phrases show little difference between the two LST groups and derive from both. Style of delivery phrases include: '*make clear what is required; recognise the need for students to revisit the tutorial more than once; I prefer hearing someone talking to me ... I learn better this way; [need to] experience the library research skills themselves; and, by giving an activity after tutorial so that they can learn by doing as well'*. Regarding content a student would like: '*more detailed information on using keywords; more examples on how to reference; and make relevant to particular assignment'*. The final phrase offered below did not fit either theme but is worthy of inclusion. A student from the generic LST group suggested *'make it compulsory'*.

Analysis of Objective Measure

The overall grade (as a percent) for the students in each science subject who participated in the online survey comprises the data for analysis in this section. It is assumed that this is an indirect measure of their LST efficacy. Table 4 shows the mean and standard deviation (the descriptive statistics) for each science subject, gender, whether this was the students first semester of study, and the mode of study (internal versus external).

Table 4: Research Report Grade for Science Subject, Gender, Semester and Mode of Study (N=47)

Variable	Research Report Grade (%)		Science Subject (n)	
	Mean	SD	Psychology	Anatomy & Physiology
Science Subject				
Psychology (n=28)	49.04	16.69	28	-
Anatomy & Physiology (n=19)	83.24	13.38	-	19
Gender				
Male (n=10)	59.20	24.58	5	5
Female (n=37)	59.59	22.60	23	14
Semester				
First (n=26)	67.08	23.17	12	14
Subsequent (n=21)	57.64	21.83	16	5
***Mode of Study**				
Internal (n=16)	70.94	20.00	6	10
External (n=30)	58.69	23.38	22	8

**one A&P student chose not to respond*

For inferential analysis, a parametric test for mean difference (unequal variance, independent *t* test) was conducted. There was a significant science subject difference in mean grade for research report, $t(45) = 7.45$, $p < .001$ (one tailed). No significant difference gender difference was found, $t(45) = -.95$, $p = .347$ (two tailed). Overall the semester of study was not significant, $t(45) = 1.31$, $p = .197$ (two tailed) although a mean difference of nearly 10% favouring first semester, novice students was reported. Further analysis of these novice undergraduates showed a statistically different mean report grade between the science subjects, $t(24) = 5.39$, $p <.001$. The mode of study did not show a significant mean difference, $t(44) = 1.41$, $p = 0.83$ (one tailed) despite a mean difference of 12% benefitting the internal mode. However, if the external mode data is analysed separately, there was a significant difference between the mean science subject grades, $t(28) = 6.29$, $p< .001$. An interpretation of the results follows in the discussion.

Discussion

This empirical study has examined the use of emergent technologies, in the acquisition of information, for diverse cohorts of students enrolled in two scientific subjects. Departmental issues constrained a generic online LST in psychology, whereas, the anatomy & physiology lecturer collaborated with an expert librarian to devise and embed a virtual, context-specific LST. In relation to the first a priori hypothesis, the quantitative data for the LST scale does not fully support the primary research hypothesis. Thus there is no significance difference in the quantitative student evaluation of the LST between those receiving the generic version compared to those who received the context-specific version. However, the direction of the difference in the mean values as a percent of the maximum sum of the scale does provide evidence of some support for the hypothesis; generic (71.1%) compared to context-specific (78%). Interestingly, there was also a slight difference between the two subscales, with the affective rating being above the cognitive rating for both generic and context-specific LST groups. This was an innovative measurement tool and the study was exploratory, so the importance of, and the differential between, the two subscales remains to be verified.

There were some statistically significant differences between the two groups. Cognitively loaded items did produce significantly higher ratings from the context specific LST group compared to the generic LST group. These items measured student knowledge of 'appropriate evidence' and 'how to evaluate quality of source'. Also, a post-hoc analysis showed a medium effect difference between the rating for the LST between internal and external mode students, the latter rating the LST as higher. This may provide an insight into a different 'lived' experience for students between the two modes of study and is worthy of further investigation. Only 17% of the sample suggested a doubling the duration for LST from one to two hours, which reinforced the present designed time. These results based on a reliable survey instrument add to the knowledge about student evaluation of LST which, according to Johnson et al., (2010) and McGuiness (2009), was lacking in the literature.

The most compelling results derive from the rich source of information from an emic perspective, that is, the qualia, the subjective or qualitative textual statements from the students. The large (x10) positive: negative ratio difference between the generic (2.11) and context-specific LST groups (21) reveal the lived experience for the latter group far exceeded the former in terms of positivity. This refutes Fisher's (2006) proposition that massification might cause a reduction in the student experience. Without providing a limitation, to restrict student responses, it was interesting that thematic analysis provided a framework (style of delivery, content and support) to inform feedforward planning to redesign LST for learning for the future. Like Donovan et al. (2010) the authors of this paper do not perceive student evaluation as a threat, but wish to learn from the students to improve the learning experience for subsequent cohorts.

The secondary hypothesis has been supported by the results. Students receiving a generic library skills tutorial did achieve a lower grade (psychology: 49.04%) in the academic writing task than students receiving the context-specific library skills tutorial (anatomy & physiology: 83.24%). The value and validity of this metric will be examined in the section on limitations. Subsidiary analysis reveals interesting insights into the patterns of the mean grade achieved by subsets of the sample. Novice students gained significantly higher grades for their research report than students who had studied before. This seems counter intuitive and perhaps might be explained by the ideas that 'experienced' and 'external' students feel they do not need to be shown again how to use databases, etc. Certainly one qualitative comment from a student (external; generic LST) in the online evaluative survey testifies to this effect *'I did do this tutorial for [named subject] and it was informative but took me hours'* and is dismissive. Also, these students might be repeating the same subject and bring their associated issues of progress.

The non-significance difference for mode of study was interesting as it might be interpreted that face-to-face (internal) LST had not impacted favourably upon the student's academic writing when compared to an online (external) LST. However, the significant difference between the two science subjects, for students studying only in external mode, privileged the context-specific LST over the generic LST. A cogent comment from a student (external; generic LST) stated that we should be cognisant of the advantage of the archived online tutorial as the student may *'revisit the tutorial more than once'*. This reinforced Wesch's (2009) concept of developing generic online packages available on-demand.

This comparative study has shown differences in student ratings (and performance) of generic online non-integrated instructional LST with an enhanced fully integrated context-specific (course embedded) LST which was student-centred and applied social constructivist learning principles. The generic tutorial has provided a clear algorithm, a step-by-step instructive process, to search library databases using generic keywords and phrases. However, the context specific tutorial transforms the process through supportive collaboration, connection and customisation (Gilliver-Brown, & Johnson, 2009). It provided meaningful activities in an almost individual learning environment that were fundamental in supporting students to bridge learning gaps (Brew & Ginns, 2008) and complete their assigned tasks.

The complex problem of redesigning generic LSTs for all subjects is now manifest. Blewitt (2010) and McWilliam and Dawson (2008) consider creativity as central to teaching in higher education. That the complex questions of the future will demand creative and forward-looking individuals who are not constrained by the functional fixedness of their role and can perceive of non-linear and emergent solutions. As lecturers and librarians we are challenged by the consumers to consider new approaches to teaching information literacy by examining methods of online instruction that can transform the future learning experience, promote self-directed learning (Ellis, 2004), be sustainable, and be relevant for the context (subject), even the assignment. This will provide an opportunity to use the emerging space of digital infrastructure, to underpin the development of digital literacy skills, and provide affective and cognitive support to first year students.

Important perspectives into the emic perspective of cognitive access and digital literacy have been discussed. While understanding the process of their engagement in their learning the higher affective responses and qualia from the students reveal that the relationship with a supportive and inclusive learning tutor is fundamental. It sets a base for lifelong learning (sustainability), being able to, with confidence, identify, retrieve, and evaluate sources of information, write with authority by citing/referencing appropriately and be able to use, synthesise and construct knowledge.

Limitations

All research design is compromised and in this study the major threats to internal and external validity are evaluated. External validity is threatened by sampling errors. A reason for the small response rate (11%) may be explained by the timing of the survey deployment. The invitation was issued in the last weeks of semester when the student priority is their preparation for final examinations. Regarding the objective measure, a critique of the sample, the nature of respondents, may have potentially biased this result. The sample who responded may not be representative of larger target population, for each science subject, with respect to their assessment grade.

The psychology respondents recorded a lower mean research report grade than all the psychology students. The anatomy & physiology respondents recorded a significantly higher (nearly 14%) mean than all anatomy & physiology students. These bias samples from each science subject are interesting and is worthy of further investigation. Further questions might enable an understanding into the possible motive for students in completing an online evaluation survey. On face value the differential calibre of the students who respond might enrich our data set and inform appropriate action to design more targeted interventions for the future of learning.

Student evaluation can empower students if they are made aware that as a result of their feedback subsequent changes have been put into practice. This feedforward process enables them to become part of their learning community and to maximise their educational opportunity (Donovan et al., 2010). Johnson (2002, as cited in Donovan et al., 2010) noted an increase in annual response rates from 40%, then 51%, 62% and finally 71%. Although this study is starting at a lower initial rate, it is the first in a planned series of student evaluations. The size of the sample (n=47) may be small but this is not deemed important when considering: the exploratory nature of the study; the sample was representative of the target population demographics; statistically significant difference were reported; and, rich qualia was obtained. The latter comment suggests student evaluations in the future might ask more open-ended questions, perhaps even use focus groups, even virtual focus groups.

Design error threatens internal validity. This was not a pre-test, post-test survey based on an intervention for a single cohort of students who might be their own controls. Rather the quasi-experimental design exploited an existing difference between two scientific subjects creating an independent design. Psychology offered the generic LST, and anatomy & physiology mandated a context-specific LST. Despite the HREC suggesting random allocation to the two LST groups within one science subject, the authors considered this contrary to natural justice. Also, outcomes from the study can now inform a course development cycle in psychology which is currently undergoing reaccreditation. However, the LST was part of a similar piece of academic writing, a research report

Further threats to internal validity include measurement errors. The Likert scoring for the LSTScale used a middle value; in future it may be better to use a tipping point, even-numbered, scale to create a difference. Although consistency between the seven items showed good reliability (alpha = 0.88) it does not imply that this is a valid measuring tool. Also, a self report survey, of an event that happened weeks ago, can be contaminated by retrospective memory. Students may also be reporting in a perceived socially desirable manner to please their lecturer. Regarding quantitative analyses, the non-parametric tests are not as sensitive at detecting an effect of independent variable (type of LST) on the dependent variable (score on the LSTScale), however, as the effect sizes reported are medium this can be considered acceptable. Bias may have occurred in thematic analysis of the qualia by the primary author; however, this effect was reduced by independent checking by the co-authors and others.

Another measurement error exists and will need to be addressed if the study is repeated. The objective measure of the final grade for the student research report is considered an indirect but assumed measure of the efficacy of the LST. This is a crude overall measure and is not sensitive to show only the skills gained from the LSTs. It reflects more than the student's ability to use databases to identify, retrieve, evaluate and cite academically acceptable sources of information. It shows their ability to develop a coherent and holistic approach to academic writing; including developing hypotheses, planning a method, analysing and interpreting results. A more sensitive assessment rubric for the research report might reveal a submark for these particular skills. Or a new task, such as, developing an EndNote library to use for a specific topic might be developed and graded separately as a milestone to report writing. However, that may seem removed from such an authentic task as a scientific research report.

Learning for the Future

This experimental development research evaluating LST has been innovative and findings of this study are currently being put into practice for semester two. The online evaluation provided an administrative convenience for timely student feedback. Institutions are concerned with the macro-level delivery (massification and the citizenship of the academies). However, it is the authors, as lecturers and librarians, working at the micro-level, that the details of the skills and competences are delivered. Innovative practices and procedures need to be developed to maximise the efficiency of lecturers and librarians in delivering to a large, external student cohort. Furthermore, librarians may have little or no instructional design training, and institutional support needs to be made for their professional development, as embedding an LST may create workload efficiency gains for the future.

The authors are collaborating to develop creative, reciprocal and non-linear LSTs through formative feedback. We are building on this trajectory and planning a future for learning, particularly knowledge acquisition in undergraduate science students. An emerging issue from the student perspective was support, which can be achieved by the use of multiple resources and social software tools. A final quote reveals the need for vicarious social learning in a collaborative situation and reinforces concepts of social constructionism and digital inclusion. The last words are reserved for an external, context-specific LST student.

> It gave me an ability to research and collate material properly; otherwise I think I would still be all at sea. The collaboration sessions were good to be able to hear what problems other students may have. However, this never beats face to face situations and it is something all external students especially those in an isolated area must come across.

Office of Learning and Teaching
Charles Darwin University

A review of the teaching spaces at Charles Darwin University merged top-down directives with bottom-up requirements from user groups (students, academics and support staff). The space of tension between the three top-down drivers from outside and within the walls of a regional Northern Australian university had to be managed and prioritised to ensure the needs of local stakeholders were met as far as economically and practicably possible. By going beyond blended learning the aim is to provide a deeper level of engagement and collaboration to create synergies designed to bring the distant external students into the classroom. This will be mediated by the use of web-conferencing within the teaching spaces. The change process is examined with respect to five issues identified as relevant for this teaching mode to improve the sustainability of our teaching practices.
Keywords: teaching spaces, learning spaces, blended learning, web-conferencing.

Introduction

To initiate and facilitate an innovative upgrade of the video conferencing infrastructure at Charles Darwin University (CDU) a step-wise design process had to be developed. First, a comprehensive review of the centrally managed teaching spaces, and their use, was undertaken by members of the Office of Learning and Teaching (OLT) (West, Billany & Garnett, 2012). Five design factors were identified and examined. Second, recommendations from this review had to be prioritised and operationalised in sequence to create usable outcomes in a climate of change. One design outcome of note is a number of *Collaborate Rooms* which has raised a further five issues which are discussed.

Design Factors

The West et al. (2012) review identified a number of dependent factors that informed the design principles that were applied. These five factors can be categorised as either strategic or humanistic. The three strategic top-down influencers comprise two national and one local strategy, and the humanistic bottom-up influencers are both local based factors. These are:

- Strategic National: Benchmarking with the Association of Educational Technology Managers (AETM)
- Strategic National: Teaching spaces projects funded by the former Australian Learning and Teaching Council (ALTC)
- Strategic Local: CDU strategic plan
- Humanistic Local: CDU students
- Humanistic Local: CDU academic and support staff.

National Top-Down: Benchmarking with AETM Standards

The AETM is an Australasian organisation that represents the audio visual professionals of the tertiary education sector in the promotion, development and deployment of audio visual technology in the teaching space. The audio visual design guidelines (AETM, 2010) for tertiary teaching spaces are intended as an independent benchmark. The AETM defines a teaching space as having eight elements: lectern and control; lighting; information technology and computing; projection and display; other sources; audio; recording; and, video conferencing. The specifications are extensive; however, the primary focus is on internal teaching with remote access and control of lighting, recording equipment and teaching materials. CDU’s teaching spaces were benchmarked against these guidelines, a number of other Australian universities, and findings from previous ALTC funded teaching spaces projects.

National Top-Down: Prior ALTC Funded Teaching Spaces Projects

From these projects a range of resources exist that synthesise pedagogical considerations with the principles of teaching space design (Keppell, Souter & Riddle, 2012; Mitchell, White, Pospsil, Killey, Liu & Matthews, 2010). In a previous ALTC funded project one of these was particularly pertinent for CDU. Mitchell et al.

(2010) specifically examined the retrofit of university learning spaces and suggest eight key pedagogical principles be taken into consideration when redesigning existing teaching spaces. These are:

Principle 1: Spaces should support a range of learners and learning activities
Principle 2: Spaces should provide a quality experience for users
Principle 3: Spaces should help foster a sense of emotional and cultural safety
Principle 4: Spaces should enable easy access by everyone
Principle 5: Spaces should emphasize simplicity of design
Principle 6: Spaces should integrate seamlessly with other physical and virtual spaces
Principle 7: Space should be fit-for-purpose, now and into the future
Principle 8: Spaces should embed a range of appropriate, reliable and effective technologies

As a result of this prior project at CDU a number of specialist teaching rooms were modified and are being used very successfully. However, these are heavily booked and not available to most of the teaching staff. It is considered a pilot project and its evaluation informs the CDU strategic Learning and Teaching Plan and hence this present project in a form of a cohesive project with ongoing quality assurance.

Local Top-Down: The CDU Strategic Plan

De Gregori (2011) links the eight general principles listed above to a specific context and this concept is reinforced by Reushle (2012) in the PaSsPorT learning space design model. De Gregori argues that the physical space must be connected to the specific model of learning and teaching adopted by an institution. This somewhat simple principle, while appearing obvious, is often overlooked. However, visionary managers at CDU have chosen to apply these principles in the Learning & Teaching Plan 2012 -2014. Of the strategic areas stated in that Plan one includes improving internal and online student satisfaction with teaching spaces by incorporating digital technology into teaching spaces whether physical and/or virtual.

Thus the CDU self assessment portfolio (2011) is committed to bringing in a ‘Fleximode’ approach which incorporates the concept that “students may engage with their programs using the combination of methods that is most suitable for their needs, rather than being constrained by imposed study mode parameters ... fleximode aspires to address, in a manner seamless to the student, at least the following variables:

- asynchronous and synchronous engagement by students
- students and staff who are physically present and physically distant, ... and
- individual learner engagement and learner group engagement” (CDU, 2011, p. 30).

This time of change has significant implications: the configuration of the teaching spaces (physical and virtual), curriculum design, how teaching is performed in these new spaces, and how CDU students are expected to learn in these spaces.

Bottom-up: The CDU students

In the last decade CDU has moved increasingly to external delivery, and is “one of only a few Australian universities at which more than 50% of the student population is enrolled in some form of distance education” (CDU, 2012, p. 5). The process of externalisation to meet market forces has created a paradigm shift in how these students are served. The traditional distance education model with hard copy packages has been superseded by technology mediated delivery of units with electronic resources available 24/7. The percentage of external students has grown from approximately 20% in 2001 to 62% in 2010. This has been achieved primarily through the development of online learning systems that are proving equally beneficial for on-campus students.

For a unit of study, both internal and external cohorts of students normally have access to the same teaching resources in a ‘blended’ site in Learnline (CDU’s Learning Management System, powered by Blackboard v9.1). A surface perception of this blended delivery might be that the internal students have gained access to resources designed for the external student in virtual teaching spaces. Blended delivery has blurred the temporal and spatial patterning of traditional learning for the internal student. Now, the teacher, peers and resources are available 24/7 and the place is no longer confined to a university building. This project is designed to redress this imbalance and to provide the external student with an internal experience. For the future, in **beyond blended learning** we are reviewing the teaching spaces at CDU with an aim to upgrade the technologies beyond normal video conferencing. It is hoped that a deeper level of engagement will create synergies that emerge from increasing engagement and collaboration as we bring the **outside in**.

Bottom-up: The CDU staff

In 2009, CDU academic staff participated in an anonymous survey (Voice Project Staff Survey). One item required a textual response about how CDU might be improved. A search of the qualitative responses elicited 35 phrases containing one or more of the following keywords: lecture theatre; classroom; tutorial room; seminar room; a/v; audio; video; audio/visual; educational technology; equipment; physical; resources; and, environment. The comments were generic and often requested 'better' and 'up-to-date equipment' in 'teaching rooms'. To determine specific requirements from academic staff, a number (N=5) were arbitrarily selected from different Schools and based on experience. These were invited to be interviewed about their experiences of using the rooms in the central teaching building, including any constraints in their approaches due to the technology and layout. Also, to gain an insider view on what they, as users, believed should be included in a future upgrade.

From the initial selection a snowballing of participants occurred, as staff were keen to be involved, and saturation (no new information was being gathered) was reached after eight participants. Thematic analysis of the notes taken by the interviewer was undertaken. This was checked by an independent academic to reduce any potential subjective bias during the interpretation stage. All staff members stressed and commented on the following themes/issues:

1. Reliable internet connectivity for staff and students.
2. Standardised presentation computers need to be in placed in all rooms with audio and video capability.
3. Presentation screens need to be better positioned, the correct size for the room, and preferably, moveable.
4. Incorporating methods for Fleximode delivery to allow recording of activities/demonstrations for easy transfer into Learnline, and use of web-conferencing to bring external students into the classroom.
5. The rooms need to be inviting to enhance the experience of being in the space.
6. The furniture, generally small rectangular tables, whilst being easily moveable and adaptable to different teaching situations could be improved for group work.

The five design factors discussed have led to several outcomes. It was proposed that all teaching rooms be equipped with a set of standard equipment as a minimum basic level of technology to be thereafter built upon for specific requirements and to a more advanced level. One of the specific requirements was a number of rooms, *Collaborate Rooms*, which are now being designed to support the use of web-conferencing software Learnline Collaborate.

Outcome: A new room design

The rooms chosen for this design are mostly flat seminar style rooms which will be fitted out between November 2012 and February 2013. This web-conferencing tool is now incorporated into Learnline and brings external students into a live lecture or tutorial. This new room design raises five issues: 1) The types and layout of technology in the room; 2) The interaction between the student groups; 3) The multiple roles of the lecturer; 4) The pedagogical strategies used in the room; and, 5) The support requirements.

The types and layout of technology in the room

In the recent past some lecturers have used web conferencing software with the traditional layout. That is the data projection screen behind the lecturer and in front of the internal students. This has caused problems as the external students are, in effect, behind the lecturer. A lecturer has to pivot from facing internal students to then view external students, who then see the back of the lecturer. The dance continues with no group entirely satisfied with the experience. Example layouts of spatial settings to suit differing educational interactions are discussed in Keppell et al. (2012).

The interaction between the student groups

Even though both groups of students are present for a common purpose, some initial pilot sessions with the traditional setup has shown that there can be some irritation from either or both groups, as each doesn't easily accept the other in what they regard as their teaching space and time. West et al. (2012) report that distance students in the online environment often appreciate the opportunity for interaction with on-campus students. Also, extra time spent on adjusting and monitoring the technology has been reflected in some evaluative comments from students. Strategies will need to be developed to address these and for the lecturer to explicitly communicate the value-add for all the students.

The multiples roles of the lecturer

Lecturer roles; pedagogical, technical, social, and managerial, were described by Berge (1995) and are still widely quoted. More recently, these multiple roles have been further defined by Baran, Correia and Thompson (2011) who critically analysed the literature on online teaching practice. They add the roles of instructional designer and facilitator. Being both an internal and an online teacher blurs roles in time and place. Understanding these roles is important in the professional development for lecturers of the future. Harden and Crosby (2000) summarise six key areas of activity for the teacher. As: 1) information provider; 2) role model; 3) facilitator; 4) assessor; 5) planner; and, 6) resource developer. A key role of the staff from the OLT is to support the lecturer in decisions related to the pedagogical strategies that can be used in the rooms.

The pedagogical strategies used in the room

Emerging for the multi-role lecturer are six key principles which have been identified at CDU as a current focus for learning and teaching. First, to promote *'active learning'* the learning materials should be designed to encourage active engagement. Second, in *'structured learning'* the learning materials should provide a sequence of learning resources and activities informed by the intended learning outcomes. Third, students should be given effective and prompt *'feedback'* on their learning progress, including formative self-assessment exercises. Fourth, there should be a *'teacher presence'* including responding promptly to student queries and actively participating in learning activities. Fifth, '*collaboration'* opportunities should be provided for student interaction and to generate a sense of belonging to a community of learners. Sixth, learning should be *'inclusive'*; designed to allow for diversity in culture, learning styles and abilities.

The support requirements

CDU has just implemented a rapid response team approach to supporting staff with technology in these teaching spaces. Direct phone lines for lecturers to contact support staff will be placed in these teaching rooms.

Conclusion

This has been a review of teaching spaces and a description of the ensuing design process of retrofitting teaching spaces to suit the changing requirements of the university, the students, the staff, and current thinking in educational interactions. CDU is currently purchasing the equipment and redesigning a large number of teaching rooms with specific emphasis on *Collaborate Rooms*, designed to bring the external students into direct live contact with the lecturer and internal students in the teaching space.

Providing the new spaces as one of the foundations of CDU's Fleximode strategy and the challenge for CDU's central Office of Learning and Teaching will be to work with staff and students in using these new spaces to their most effectiveness. In conclusion, learning for the future at CDU will involve addressing the five, not mutually exclusive, issues: 1) The layout of technology in the room; 2) The interaction between the students; 3) The multiple roles of the lecturer; 4) The pedagogical strategies used in the room; and, 5) The support requirements.

Using Scenario Planning to Inform Pedagogical Practice in Virtual Worlds in Schools: Collaboration and Structure

Christopher Alan Bonfield
University of Hull

Kevin John Burden
University of Hull

Andrew Cram
Macquarie University

Katy Lumkin
NSW Department of Education and Communities

The learning affordances of virtual worlds have long being trumpeted; the barriers to the "take up" of virtual worlds in mainstream education have also been explored, with emphasis being placed on technical problems, lack of time and money. Yet, a challenge for future learning is how one *teaches* in a virtual world, and what research has been undertaken has focused largely upon tertiary education. Much less is understood about how school teachers should structure virtual lessons, and what level of collaboration or independent work is necessary to guide students towards attainment of learning outcomes. This paper will provide a theoretical review of teaching and learning in virtual worlds, and offer an initial discussion of the role and importance of structure and collaboration in virtual worlds in a school-based environment. This has been validated through four case studies using scenario-planning methodology, and drawing upon real-world practitioner-based examples.

Keywords: affordances, collaboration, pedagogy, schools, structure, teaching, virtual worlds.

Introduction

Virtual worlds are multi-user creative spaces that are ideally suited to learning activities such as simulations, artistic performances, modelling and role play, and can lead to increased motivation, engagement and collaboration (Senges & Aller, 2009; Dalgarno & Lee, 2010). The design of the virtual environment is only limited by imagination and technical skill; examples include virtual university campuses to fantasy landscapes (Prasolova-Førland, 2008). In these 3D spaces a person has a virtual embodiment in the form of an avatar. As identified by Warburton (2009), the key element to successful learning in virtual environments is the ability of both teachers and students to project themselves, *via* their avatar, into the world and become immersed in a shared learning space. In short, by using a virtual world and adopting an avatar, there is sense of "being there" in a shared 3D space and the ability to experience the immediacy of interactions which take place between users and objects in real time.

Researchers and practitioners have focused on defining the learning which takes place in virtual worlds and simulations (Bares, Zettlemoyer & Lester, 1998), pedagogical approaches for the use of Second Life (SL) in the classroom and resources to support immersive activities and ways of exploring the potential of virtual worlds. Others have investigated ways to measure the changes in learners' attitudes, interests, attention and behaviour (Molka-Danielsen, 2009). Where research has been conducted in an education setting, the focus has been upon tertiary education, teaching undergraduate courses and the development of skills such as problem-solving (Lee, Dalgarno & Farley, 2012 offer an Australian perspective).

With a few notable exceptions (Twining, 2009) less attention has been paid to the affordances of virtual worlds in a secondary and primary-school setting, and how a teacher should structure and lead (or not) their teaching in these spaces. David Deeds, an IT and language teacher in Changchun American international school in China, however, does offer some practical guidelines and notes that since introducing OpenSim into his classes, the results have 'been nothing short of phenomenal' (Deeds, 2011, p.7). Indeed, to date there is 'no primer for how to teach in a virtual world', despite extensive research been undertaken on both teaching and learning in this area (Thackray, Good & Howard 2010, p.140; Chandler, Collinson, Crellin & Duke-Williams, 2009; de Freitas & Veletsianos, 2010). This presents a major challenge to practitioners and might inhibit the future uptake of teaching in virtual worlds in schools.

This paper investigates structure and collaboration in virtual worlds, and how these should aid the design of teaching curricular interventions in-world in a school-based context. However, it must be stressed that we do not intend to offer a "one-size-fits-all" model or value judgement of different teaching styles – we argue that when teaching school children, a degree of flexibility is required and that one scenario or technique will not always be appropriate in all situations. Moreover, further research remains to be undertaken, and we offer here our initial findings based on a review of the current literature and validated through the observations of four scenarios based on the methodology of scenario planning (Snoek, 2003; Snoek et al., 2003). The paper is organised as follows: we first review the literature and set out our research questions; the second part discusses the methodology and application of scenario planning; the third section outlines four scenarios and case studies; the fourth part reviews the evidence and offers a discussion.

Research Questions and Literature Review

It has been argued that virtual worlds offer an ideal platform for the 'engagement of learners in constructivist-focused educational practice', and that student-centred learning, as opposed to teacher-led lessons, is appropriate in these contexts and environments (Moschini, 2010, p.34). Others have argued that teaching in such an environment should emphasise active collaboration and co-operative learning, interaction and activities to encourage immersion and presence (Lim, 2009; Roussou, Oliver & Slater, 2004). Further, research has demonstrated that 3D learning environments that blur the distinction between education and entertainment have the potential to produce learning experiences that are motivating and enhance student learning (Bares et al, 1998).

Dalgarno and Lee (2010) have also identified the learning affordances that virtual worlds can bring about, and how virtual worlds are suited to collaborative learning, communication and co-operation. They note that virtual worlds afford five types of learning tasks (see Table 1): (1) spatial knowledge representation; (2) experiential learning; (3) engagement; (4) contextual learning; and (5) collaborative learning. Hew and Cheung (2010) have also identified three uses of virtual world environments which are specific to learning: (1) communication spaces (that is, a place where people can communicate information in both verbal and non-verbal forms); (2) simulation spaces (a place where simulations and re-enactments can take place); and (3) experiential spaces (an environment where students can learn by doing and observe their outcomes and reflect on their own learning).

Table 1: Learning Affordances and Key Words from Delgarno and Lee (2010)

Affordance	**Key Words**
1. Representation/Fidelity	Enhanced Realism, Sense of Presence, Spatial Knowledge
2. Learning Tasks	Embodied Learning, Risk, Cost, Abstract Representations
3. Motivation and Engagement	Personalisation, Individual Goals, Game-Based
4. Interfaces	Context, Interactivity, Situated Learning
5. Collaboration	Collaborative Learning, Discourse, Communication, Co-Operative

Yet, as Dreher, Reiners, Dreher, & Dreher (2009) have identified, it is not enough to sit students in front of technology to enable them to learn. As Mcloughin and Lee (2008, p.17) acknowledge, 'the technologies themselves do not directly cause learning to occur but can afford certain learning tasks that themselves *may* result in learning or give rise to certain learning benefits'. Dalgarno and Lee (2010, p.25) call for more data to redress the fact that 'efforts in this field are largely hit-and-miss, driven by intuition and "common-sense" extrapolations rather than being solidly underpinned by research-informed models and frameworks'. Questions remain about the extent to which existing pedagogical frameworks and virtual world scenarios formed from observations and research in tertiary education are relevant to, and are suitable for, teaching school children in compulsory school settings. For instance:

1. *How far do teachers structure learning in 3D virtual worlds in Schools?*
2. *What are the Implications of Students Learning Collaboratively or Individually within a Virtual World?*

In other words, what degree of structure should be pre-designed into the virtual environment and the specific tasks set for learners; should collaborative learning always be the default option for school teachers; and to what extent should emergent learning be facilitated as opposed to prescribed learning which is more common in face-to-face contexts (Williams, Karousou & Mackness, 2011)? In their study of virtual worlds for learning communities, Senges and Alier (2009) identified that with the first generation of these worlds**,** educators did what came naturally: they 'replicated' their real world classroom teaching to the virtual world. Teachers often drew upon traditional teaching models and relied on prescriptive learning outcomes and expectations. However, it is best if content is co-constructed with learners rather than simply delivered to them. In short, teaching methods should be focused on collaboration, group work and shared contextual tasks (Molka-Danielsen, 2009; Moschini, 2010).

Yet, it does not follow that this is the only approach that should be adopted and that structured lessons might not be more suitable for certain students and particular tasks; more research needs to be undertaken concerning individualised learning, and learning which takes place outside of the classroom and the teacher's presence in virtual worlds and how this contrasts with more formalised settings. In fact, the requirement of a teacher's presence in a virtual classroom is a pertinent issue that has yet to be fully resolved. As discussed by Crook (2008), power structures in Web 2.0 technologies are still being evaluated, and it would appear that the authority of knowledge is being transferred from teachers to students; teachers are fast losing their status as all-knowing experts.

To conclude, our survey of the literature has identified key research questions that focus on how a lesson should be structured, and the importance of collaboration and co-operative learning *vs.* individualised and personalised learning. What is more, the key affordances of virtual worlds as set out above appear to align with these research areas. The next step is to frame these questions into a research methodology, and to validate this with real-world scenarios.

Methodology and Making of Scenario Writing

The research methodology adopted here was based on a review of the literature on virtual worlds (see above), and scenario-planning methodology. This draws on the work of Snoek (2003), Snoek et al (2003) and Cautreels (2003), and the critical and theoretical reflections of Linde (2003). Such a methodology has been used in business planning to enable large-scale organisations to plan for different possible futures and to take an active part in designing the future they think is desirable (Snook et al, 2003; Benammar et al, 2006). In an educational context, Snoek has argued that the making and use of scenarios stimulate the imagination of people involved, increase awareness of decisions and important factors that influence education, and enable teachers to be pro-active (Snoek et al, 2003).

It is important to reinforce that in designing different scenarios for teaching in virtual worlds, that no one scenario will emerge in a 'pure' form; and that the scenarios selected and keywords characterising each scenario are described in their extreme in order to underline differences and reinforce variables. Further, as suggested by Snoek (2003), in undertaking scenario planning we have not attached a value to each of the different scenarios - we have not assumed that one scenario is more preferable or 'better' than another. In other words, each scenario carries equal weight.

To develop and write the scenarios for teaching in virtual worlds the research team followed Snoek et al (2003) by taking four main steps. These steps took place in four Google+ video chat meetings and e-mail exchanges in 2012 between experts in the field who included staff in Academy 360, Sunderland (an all-through school in the United Kingdom), the University of Hull (United Kingdom), Department of Education and Communities, New South Wales (Australia) and Macquarie University (Australia).

<u>Step 1</u>: we drew upon our experiences of teaching and researching in virtual worlds, and our discussions with teachers who had taught a lesson or course in a virtual environment. At this stage we were interested in how to embed more fully the use of virtual worlds in schools, and to identify the main affordances and challenges of teaching in a virtual world.

<u>Step 2</u>: we reflected upon the literature review and the experience of practitioners. Following this, we followed the advice of Snoek who recommends listing of the most significant drivers dictating how teaching in a virtual world might occur, labelling these the 'push-pull' factors. *Push* factors include Social Learning, Individual Learning, Learning Outcomes and Freedom of Teaching Style, and *Pull* factors Technology, Time, Assessment and Resources.

Step 3: we concentrated on which of these factors had the most impact on teaching in a virtual world, those which were most unpredictable and those that could be used to differentiate between different scenarios. In the discussions that followed we selected two of the most import factors which could be each represented on a continuum with two possible extremes to emphasise the differences between the scenarios. For the 'x' axis we selected the continuum between teacher-centered and student-centred classes; and for the 'y' axis, the continuum between collaborative and individual learning. This then enabled us to identify four different scenarios, each scenario representing one quadrant of the two-dimensional matrix. Again, in line with the work of Snoek et al (2003), these two dimensions were not considered as opposite to each other. From this four keywords were selected to characterise each scenario (see Fig. 1):

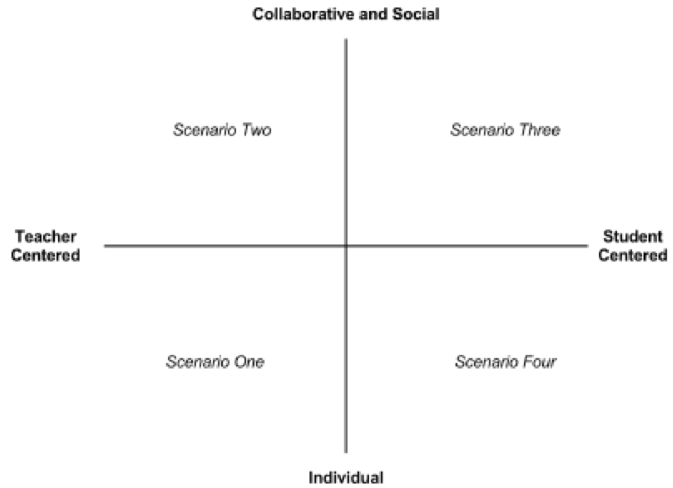

Fig. 1: Two-Dimensional Matrix Representing Four Different Scenarios

Step 4: finally, we worked on bringing the scenarios to life. In a slight departure from the methodology of scenario planning, we decided to illustrate scenarios with real-world examples that are already happening today. However, it is important to note that each of these examples do not represent a current trend amongst practitioners; they are 'one-offs', experimental and collectively do not represent a single pathway into the future. Consequently, although drawn from the present, they nonetheless permit us to offer a projection into the future; and as Snoek himself found (2010, p. 12), 'probably elements of different alternative scenarios can be found in reality', and in planning scenarios one can better reflect on current trends. To ensure consistency between each of the four scenarios, a format was made: Scenario; Discussion; and Affordances and Limitations. Each of the four scenarios, and their real-world counterparts, are described below.

Scenario One: Teacher-Led Individualised Learning

Scenario

Scenario one examines the work of Derek Robertson, National Adviser of New and Emerging Technologies, Scotland. This scenario called CANVAS (Children's Art at the National Virtual Arena of Scotland) was a teacher-asciliteled project in a virtual environment, created by Second Places. The intention was to exhibit and celebrate student created artwork in the form of still or moving images. Each artwork was accompanied by an audio recording of the learner explaining his or her concept and/or design. Thirty-two Scottish local authorities participated in this project, led by the Consolarium (Education Scotland, 2006).

Discussion

CANVAS was hosted on the Education Scotland's servers. This allowed full control over who was able to enter or view the virtual world. Teachers from each Local Authority were given the same brief for this project:

> We believe that the participative nature of the (CANVAS) design will offer a context in which young learners experiences, thoughts and understanding of their own work and development can be enriched and enhanced by the proposed opportunity for dialogue and discussion that the world offers. (Robertson, 2009)

Canvas was designed so that learners would work individually, but could interact through text chat with each other and with selected audiences, who would visit the virtual art gallery through their avatars. Learners could study the exhibition design and make deliberate choices with their teacher and peers on the appropriate placement of artwork for display. Teachers set up the initial virtual environment, and were 'present' in-world with students but adopting a supervisory role. Teachers provided opportunities for learners to critically reflect on their art making process by creating accompanying audio recordings. The objectives of the project were based on structured activities with minimum in-world collaboration opportunities. Teachers were not required to have deep technical knowledge of OpenSim and concentrated on helping students to achieve learning outcomes. The goal of Learning and Teaching Scotland was for larger scale implementation of OpenSim.

Affordances and Limitations

This scenario affords student creativity in one space. Robertson's goal was to provide opportunities for students to experience being in a virtual world while being observed by a teacher; a shared space for groups of students to exhibit, critically reflect and have a dialogue with their audiences was also offered. The artworks were created by students in real-life but exhibited in a pre-designed virtual world. The main success was that many school districts could participate in this project and teachers were able to implement this technology with a small learning curve. The innovation lies in the idea of: creative participation in one space, enabling learners to engage with dialogue about their own artwork and the work of others within a dynamic and contemporary digital setting; permitting students to curate their work knowing that this would be accompanied by a video and give the viewer information about their piece and their progress as an artist; to develop an awareness of practical and purposeful use of a range of digital tools and be part of a collegial learning community. The main project limitations included the difficulty of maintaining continuity because of firewalls. Chat functions and certain avatar customisation features were disabled due to concerns about inappropriate use by learners. Therefore, the full rich experience of a virtual world was not available to learners in this scenario. Large-scale implementation proved to be too challenging when trying to change the mindset of teachers to be responsible to maintain and populate their galleries. The intention that learners should engage with their audiences in a virtual world was clearly specified, but there were more challenges associated with this than envisaged.

Scenario Two: Teacher-Led Collaborative Learning

Scenario

Scenario two examines River City, a multi-user virtual environment aimed at developing learners' expertise in socio-scientific inquiry. This virtual world was designed by a team of academics and implemented with over 15,000 school students (Clarke & Dede, 2009). River City provides learners with a simulation of an industrial nineteenth century city, including a hospital, hotel, university, shopping, residential areas and a river (Clarke & Dede, 2009). Through interactions with residents, parts of the environment and embedded data, learners work in groups to conduct a scientific inquiry into the spread of disease throughout the city. The socio-scientific inquiry involves students: making observations; posing questions; examining books and other sources of information to see what is already known; using tools to gather, analyse, and interpret data; planning investigations; reviewing what is already known in light of experimental evidence; proposing answers, explanations, and predictions; and communicating the results (Ketelhut, Nelson, Clarke & Dede, 2010). The narrative is non-linear, with learners deciding their own trajectory in terms of what contexts they visit, to whom they talk, and what data and tools they use. The learners engage with the simulation across four time scales (seasons), allowing them to construct understandings of how the problem changes over time. To finish their inquiry, students write a letter to the Mayor of River City, which includes an authentic lab report (Ketelhut, Nelson, Clarke & Dede, 2010). Students then compare their research with other groups, to discuss and reflect on the 'many potential hypotheses and causal relationships embedded in the virtual environment' (Ketelhut, Nelson, Clarke & Dede, 2010, p.60).

Discussion

Learner experiences in River City are tightly controlled by the design of the virtual world, with students' intended learning trajectories and outcomes being broadly predetermined by the academic design team. Learners work in groups, allowing them to experience scientific teamwork and to complete more extensive challenges than would be possible individually. Cross-group collaboration is also used at the end, to give students insight into the different interpretations and results obtained by each group.

Affordances and limitations

This type of scenario allows educators to carefully design a learning experience for students (*cf.* Squire, 2006) which targets learning outcomes relating to teams and collaboration. In this scenario, the collaboration adds an element of authenticity, allowing students to experience conducting scientific inquiry in teams, including problem solving in groups and social negotiation. As the design of the virtual world is predetermined, appropriate scaffolding can be considered prior to learner engagement, as can rigorous assessment of learning. The design is also re-usable, and can be regularly evaluated and refined based on learner outcomes and feedback.

Many interactions within the virtual world are predetermined, including the provision and use of tools and the conversations that may be performed. This allows the narrative to respond to students' actions and represent the consequences. One limitation of this design, however, is that students make decisions from the provided options rather than experiencing the complexity of generating their own choices. To mitigate this limitation, some learner activity may be conducted 'outside' the world using alternate technologies or blended approaches.

Scenario Three: Student-Led Collaborative Learning

Scenario

Scenario three examines Marianne Malmstrom's work at the Elizabeth Morrow School in New York (United States), and student-led activities in Minecraft - a massively multiplayer online role-playing game. An eighth-grade student who had been using Minecraft both in school and at home instigated the scenario. The student requested if the class could role-play the young adult novel *The Hunger Games*; students worked in pairs and groups to fight to the virtual death in an arena, until one student remained as victor. The rules for the virtual game were set entirely by students; so too was the planning and organisation. The teacher was invited to act as an in-world overseer of the games. As a result of the activity's success, the students organised an after-school social event for grades five to eight, designing posters and flyers; this is the first time, Malmstrom recalls, that students entirely conceived, initiated and executed such an event themselves.

Discussion

Students, who worked together and shared knowledge in order to make meaningful interpretations, organise and communicate ideas, led the scenario. They had to contribute significantly to the trajectory of the scenario, plan and communicate roles and responsibilities. Students also had to create their own resources collaboratively to support tasks. The teacher was only present in-world in order to observe and to ensure e-safety. In short, an authoritative adult 'voice' was absent, tasks were open-ended, the lessons left unstructured in order to enable experimentation, and students worked collaboratively on a shared task.

Affordances and Limitations

Malmstrom reflected on the affordances of unstructured collaborative learning in a virtual world, noting that:

> Students love the opportunity to stretch their imagination and show what they have created … it is amazing to watch how freely they share their newly gained knowledge. … The community only thrives when each member contributes his/her area of expertise to the group. Arising conflicts and disagreements become part of the learning process, as students negotiate and resolve their own problems (Malmstrom, 2011, p.3).

The success in this area has also led to the school running a summer camp, during which goals are suspended and the school explores new platforms, tests ideas in learning theory and investigates new curriculum (see student work at KnowclueKidd, 2011). In terms of limitations, another Minecraft teacher in New York, Joel Levin (2012) has blogged on the limitations of unstructured tasks for some learners, noting that some of his children 'feel overwhelmed by the sheer number of options available to them in an open world, and need constant direction'. He recommends that 'the best designed lessons and activities provide options and multiple paths to success, catering to various play styles. This lines up nicely with traditional classroom practices of embracing a wide variety of learning style'.

Scenario Four: Student-Centred Individualised Learning

Scenario

In this scenario a single student at Elisabeth Morrow School, New York, elected to work alone in the immersive game Minecraft. Despite the collaborative nature of this game, the player demonstrated high levels of independence, persistence and resilience to build an entire world and characters. In his personal log, recorded as a machinima, he discussed working through his summer holidays to complete the world, frequently setting himself seemingly impossible high goals to achieve (e.g. completing a full scenario in a single day). Although there are occasional prompts and advice from outsiders, such as his class teacher who asks him to incorporate more screen shots in his log, this is minimal and most of the construction, activity and learning is undertaken alone. There is, therefore, little evidence of social contact and interaction in this scenario: the student works almost alone on an immersive task which is engaging and engrossing. All of the activity and learning occurs away from, and beyond the sight of, formal education, although in this case it is recognised by the class teacher who has identified this form of learning as worthy of further investigation:

> The one thing you are not covering in your paper (and what I'm personally finding the most compelling these days in terms of kids learning) is the learning that is happening beyond the classroom. We run a 24/7 server to give our kids a safe place to play after school. That is where the really cool things are happening. We are have done this for over a year for grades 5-8. We are just about to wipe their work of the last 6 months to start over with 3 fresh worlds they have designed because we are allowing students from grades 3 & 4 to join the server. This is due to student and parent request. (Malmstrom, personal correspondence, May 2012)

Discussion

Like the previous example (see above), this scenario is distinctive for the lack of a traditional authority figure or authoritative voice that is normally that of the teacher. It bears many resemblances to the previous scenario, lacking formal and predetermined input from a teacher. Hence there are no assigned learning outcomes, targets or set activities driving the learning and it is highly emergent rather than prescribed (Williams, Karousou & Mackness, 2011). However, in this scenario there is no requirement to collaborate or share with other students, and this shifts responsibility and indeed motivation entirely to the individual player. This scenario requires high level of independence, self-regulation and resilience to succeed, and for some learners this is an ideal environment or context to demonstrate their own capability without the hindrance of others who may be less inclined to work in this manner.

Affordances and Limitations

This scenario exploits the affordances of motivation and engagement whilst minimalising the collaborative affordances so often signalled as hallmarks of immersive world learning (Delgarno & Lee, 2010). It highlights learner dispositions and characteristics, such as resilience, persistence and self-regulation, which are highly desirable but often bemoaned for their absence in formal learning (Heikkilä & Lonka, 2006). The absence of a formal authority figure such as a teacher will lead many to question the value and validity of this scenario since it has limited immediate application in formal school contexts. However, this may be changing as educators such as Malmstrom begin to explore and highlight the value of these contexts and the intensity of learning related activity often undertaken in them by lone students.

Discussion

In reviewing the scenarios set out above, we do not intend to offer here definitive statements on structure and collaboration in virtual world lessons. Instead, using scenario planning has enabled us to examine alternative teaching models, and to offer suggestions to help plan for future challenges in learning and teaching in a virtual world. However, we acknowledge that our findings are based on narrow observations, taken from selective examples, and further research is required in this area. We offer a set of suggestions for further research; a starting point to better understand, reflect and inform an ongoing strategic conversation about the future role and importance of structure and collaboration in virtual worlds in a school-based environment. On the basis of scenario planning we suggest that a better way of looking at our original research questions of (1) *How far do teachers structure learning in 3D virtual worlds*?, and (2) *What are the Implications of Students Learning Collaboratively or Individually within a Virtual World?*, is through a theoretical perspective – a lens which focuses on a central issue: the teaching model(s) adopted by teachers in 3D worlds. In line with our scenario matrix, this has two axes: the Teacher-Student axis, and the Collaborative-Individual Learning Axis.

Teacher-Student Axis

First, our findings have demonstrated that teachers are best advised to adopt, as they already do in the 'real world', a 'best-fit' approach to the structure of lessons in virtual worlds, adopting a flexible approach dependent on the nature of individual students, the class, the teacher and the ethos of the school. For instance, scenario four worked because there was a teacher who had the experience and confidence to allow a highly unstructured approach to learning – but such a scenario would not suit everybody. Teachers, for example, who initially adopt teaching in virtual worlds are by their nature 'risk takers' and are perhaps are more confident to adopt lessons which are more unstructured; in contrast, teachers who are more resistant to technology and change might require more control initially. Indeed, teachers (and other stakeholders) may need to revise their attitudes and beliefs about prescribed and emergent learning as many of the apparent learning gains in immersive worlds occur when there is less prescription and teachers are happy to go with the flow; this of course raises the conundrum of how do you plan for emergent learning!

Furthermore, research should be undertaken which questions to what extent the term 'structure' actually transfers from the world of face-to-face teaching to the virtual world. For example, in the 'real world' spatial structures, such as walls, chairs and equipment, and temporal structures, such as fixed lesson times, influence how teachers plan and deliver lessons. In a virtual world, temporal structures are, perhaps, more transferable as a server can be turned on and off, and the environment can be changed from day into night. However, space is probably harder to structure in a virtual world – there are issues surrounding class room management, and 'control' of avatars in a space in which they walk, talk and fly. A 3D virtual space, it goes without saying, is not the same space as a physical classroom, and teachers will need to plan accordingly. In short, there is probably no one ideal solution to structure – as each scenario demonstrated, each has positive and negative values for teaching as it currently stands, although some are far more likely to be appropriated and assimilated into formal learning than others.

Collaborative-Individual Learning Axis

The findings from the four scenarios demonstrate that both individual and collaborative tasks have the potential to lead to rich learning experiences, depending on the students and teachers' abilities to use a virtual world effectively. We suggest that although an enriched and motivated learning experience can be achieved in each of the four quadrants, teachers need to be aware of a number of critical issues. First, the teacher needs to take into consideration students' personal ability and motivation to use virtual worlds, and learn either individually or collaboratively. Watulak (2012) notes that students who have lower abilities and less interest in technology may feel anxious and ostracised when a high level of importance is placed on it by their educational institution. Therefore, those students who have an initial low-level of technical ability might struggle if their first lesson is highly unstructured, collaborative and the teacher is 'absent'; in such cases the teacher should ensure that each student is sufficiently supported in developing the necessary expertise to effectively participate in the learning. As a point of good practice (Gardner et al, 2010), it is recommended that teachers use formative assessment to adjust teaching and to allow students to have an understanding of their strengths and next steps, as is appropriate in face to face teaching. As teachers have found in the classroom, one of the best ways to engage students in the virtual world is to begin the sequence of lessons (even when they do not intend to be present) with a 'tutorial' type introduction in a similar style to computer games, as this will address the issues of the basic technological skills which allows students time to become acclimatised to the new environment (Malmstrom, 2011; Levin, 2011).

In addition, student motivation to learn in virtual worlds should also be taken into account. Shen and Eder (2009) used the Technology Acceptance Model (TAM) to identify the receptivity of users to using virtual worlds in teaching and learning. For acceptance to take place, they measured the combination of 'perceived usefulness' and 'perceived ease of use'. Further, Calongne (2008, p.38) identifies that it is important to capture the student's imagination with the possibilities of what the technology can achieve and use 'cool technology, exciting research, entertainment, and great visuals to inflame students' imagination.' Before embarking on any type of teaching in a virtual environment, be that individual or collaborative, teachers might find that it is important for students to have a good understanding of how using technology can enhance their overall learning, and in turn that they reflect on themselves as learners and on the learning process.

As a final observation, a teacher does not need to be present in a virtual world for learning to take place. Yet, teachers need to be aware of the different pedagogical affordances of virtual worlds in order to maximise the use of these spaces for teaching and learning. It is perhaps reassuring, therefore, to end the paper with the observation that a teacher is required, even in a very decentralised, student-centred environment, in order to recognise the learning which takes place, to support learners and to undertake assessment.

Do Open Educational Resources represent additional challenges or advantages to the current climate of change in the Australian higher education sector?

Carina Bossu
University of New England

Mark Brown
Massey University

David Bull
University of Southern Queensland

This paper briefly reports on a number of Open Educational Resources (OER) initiatives in Australia, including some government programs and funding, then explores several of the challenges and advantages of adopting OER at institutional and individual (educators and learners) levels. This paper also discusses some of the preliminary findings of a centrally funded research project that investigates the state of play of OER in Australia. This project surveyed the higher education sector and interviewed key stakeholders. According to participants, the use of OER has the potential to lead to new pedagogical practices, can improve the quality of educational learning materials, and promote social inclusion across the Australian higher educational sector. However, there are still challenges to be overcome such as current academic culture, lack of awareness and issues related to finding quality materials. The above could represent additional challenges to the current climate of change faced by the higher educational sector in Australia.

Keywords: open educational resources, advantages and challenges, OER in Australia.

Introduction

Open Educational Resources (OER) represent an emergent movement that is re-shaping learning and teaching in higher education worldwide. Claimed as one technology to be closely consider by higher education institutions, OER are already influencing the way institutions worldwide offer education and market themselves (Johnson, Levine, Smith, & Stone, 2010). In fact, the growth of the open educational trend "is a response to the rising costs of education, the desire for accessing learning in areas where such access is difficult, and an expression of student choice about when and how to learn" (Johnson, et al., 2010, p. 6). In addition, OER has the potential to meet the growing demand for higher education worldwide, and to close the gap between formal, non-formal and informal education (Kanwar, Kodhandaraman, & Umar, 2010; Pereira, 2007). The OER movement "is a technology-empowered effort to create and share educational content on a global level" (Caswell, Henson, Jensen, & Wiley, 2008, p. 2). Since being first coined by UNESCO during the Forum on the Impact of Open Courseware for Higher Education in Developing Countries hosted by UNESCO in 2002, the term "open educational resources" has been re-defined several times to meet the fast evolving pace of the movement and to fit into the diverse range of contexts that it has been applied.

Some of the definitions available are:

- "Open Educational Resources (OER) are teaching, learning, and research resources that reside in the public domain or have been released under an intellectual property license that permits their free use or re-purposing by others. Open educational resources include full courses, course materials, modules, textbooks, streaming videos, tests, software, and any other tools, materials, or techniques used to support access to knowledge" (Atkins, Brown, & Hammond, 2007, p. 4).
- "Open Educational Resources (OER) are teaching, learning, and research materials in any medium that reside in the public domain or have been released under an open license that permits their free use and re-purposing by others" (Creative Commons, 2012).
- "Open Educational Resources (OERs), are educational materials which are licensed in ways that provide permissions for individuals and institutions to reuse, adapt and modify the materials for their own use. OERs can, and do include full courses, textbooks, streaming videos, exams, software, and any other materials or techniques supporting learning" (OER Foundation, 2011).

- "Digitised materials offered freely and openly for educators, students, and self-learners to use and reuse for teaching, learning, and research. OER includes learning content, software tools to develop, use, and distribute content, and implementation resources such as open licences" (OECD, 2007, p. 10)

The definition by the Organisation for Economic Co-operation and Development (OECD) also suggested that OERs might also include three separate types of resources:

- Learning Content*:* Full courses, courseware, content modules, learning objects, collections and journals.
- Tools: Software to support the development, use, re-use and delivery of learning content including searching and organization of content, content and learning management systems, content development tools and on-line learning communities.
- Implementation Resources: These include intellectual property licenses to promote open publishing of materials, design principles of best practice and localization of content (OECD, 2007, p. 30).

It is stated in the WikiEducator online training website "Open content licensing 4 educators", that "there is growing consensus that a definition of OER ideally needs to incorporate three interrelated dimensions:

- Educational values: OER should be free;
- Pedagogical utility: OER should embed the permissions of the 4Rs (reuse, revise, remix and redistribute); and
- Technology enablers: Technology and media choices should not restrict the permissions of the 4R framework" (WikiEducator, 2012).

Currently, many universities around the globe have launched OER projects. Millions of learners have benefited from learning through OER materials, and many educational institutions, including distance education providers, have obtained significant rewards in terms of enhancing their reputations, increasing student enrolment and developing innovative ways to produce distance learning materials (Wiley & Gurrell, 2009). Also, OER have contributed significantly to the proliferation of virtual communities of learning, where students, teachers and experts in their fields can discuss, make contributions and learn with each other through online collaboration (D'Antoni, 2008). However, the OER movement is facing many challenges. It is still grappling with issues such as resistance to giving away information and knowledge for "free"; at no cost and free to use and re-use. Licensing, intellectual propriety and copyright of OER are also matters that remain ambiguous to educational institutions. In a similar fashion, many questions associated with policy development, sustainability and quality of OER continue to be unanswered and under researched. In fact, according to UNESCO (D'Antoni, 2008, p.11), the above concerning matters are listed amongst the 14 priority issues that deserve attention for further development of OERs, with "awareness raising and promotion" being the first priority. Despite these issues, the OER movement is growing and gaining importance within the higher education landscape in many developing and developed nations. However, in Australia there is still a limited number of OER initiatives and programs at higher education levels compared with other developed countries such as the US, UK and some other European countries (Bossu, Brown, & Bull, 2011).

This paper begins by briefly reporting on some OER initiatives in Australia, including some government programs and funding. The authors then explore some of the remaining challenges and advantages of adopting OER at institutional and individual (educators and learners) levels. This paper proceeds to discuss some of the preliminary findings of a centrally funded research project that investigates the state of play of OER in Australia and which surveyed the higher education sector and interviewed key stakeholders. The research findings revealed that there should be greater strategic direction from government bodies and institutions to regulate and foster the adoption of OER in Australia. According to participants, the use of OER has the potential to lead to new pedagogical practices, can improve the quality of educational learning materials, and promote social inclusion across the Australian higher educational sector. However, there are still challenges to be overcome such as current academic culture, lack of awareness amongst educators and learners and issues related to finding quality materials.

OER Movement in Australia

Some of the most popular OER initiatives at institutional level are:

- Macquarie University with its Macquarie E-Learning Centre of Excellence (MELCOE), which specialises in developing open source software tools and open standards for e-learning (OECD, 2007);
- The University of Southern Queensland (USQ), which remains the only Australian member of the

OpenCourseWare Consortium (OCWC) (Bull, Bossu, & Brown, 2011);

- USQ, and more recently the University of Wollongong, are the only two Australian universities members of the OER university initiative (Thompson, 2011);
- The College of Fine Arts (COFA), with the University of New South Wales (UNSW), developed quality video and text resources to assist educators to teach online (COFA, 2011); and
- The University of Canberra RecentChangesCamp2012; an annual meeting of interested Open Space. This free gathering has taken place for the third time in Australia and is focused on wikis and online collaborative practices. "The aims of these events are to draw together people interested in worldwide iterative knowledge involvement or wikis, to discuss and share knowledge, and eat and socialise in a friendly face to face setting" (RCC2012, 2012, para. 1).

Also, a few Australian universities have released some of their teaching materials through iTunesU. Others have created repositories of learning objects. Unfortunately, some of these repositories can only be accessed by the universities' staff and students. Even though some of these repositories support the Creative Commons license, very few allow for redesigning and repurposing of the content, which therefore limits the value of these resources.

In addition to the institutional initiatives mentioned above, there have been programs and policy developments at the governmental level in Australia. For example:

- The Australian Government's Open Access and Licensing Framework (AusGOAL), which provides a set of guidelines "to government and related sectors to facilitate open access to publicly funded information" (AusGOAL, 2011, para. 1);
- The Australian National Data Service (ANDS), which is a database containing research resources from research institutions in Australia (ANDS, 2011);
- The Guide to Open Source Software for Australian Government Agencies, which is a policy that requires that government agencies first consider open source software options when requesting tenders (Gray, 2011); and
- Government 2.0, which is an Australian government initiative focused on the "use of technology to encourage a more open and transparent form of government, where the public has a greater role in forming policy and has improved access to government information" (Australian Government, 2012, para. 1).

Despite the fact that the above Australian government developments are on par with a number of developments in the UK, the US and also in some European countries (Helsper, 2011), they are mostly concentrated on government bodies. The opposite can be said in relation to policies and developments with an educational focus, as Australia seems to be behind the mentioned countries (Bossu, et al., 2011). If the Australian government wishes to take advantage of the benefits of open educational resources and practices, it will need to adopt strategies that take this movement out of the shadows and place it in a more prominent position within the educational mainstream. Such strategies could assist the government to effectively achieve some of its current agenda, such as to increase participation and access to education to a more diverse student cohort, particularly working adults and those residing in rural and remote locations of Australia (Bradley, Noonan, Nugent, & Scales, 2008). However, despite the potential advantages of OER, many challenges remain, as fundamental changes in the higher educational landscape tend to take place slowly and attract many disbelievers. Some benefits and challenges of the OER movement are discussed next.

Advantages and Challenges of OER

Research shows that OER bring many benefits to educational institutions, educators and traditional and non-traditional learners. At institutional levels, OER can assist to reduce costs, improve quality and bring innovation to traditional educational material (Caswell, et al., 2008). Thus, assisting senior managers and educational leaders to lead in the current climate of change across the higher education landscape worldwide. OER can also be used as market tools by making educational resources publically available on the Internet. Other reasons why institutions should consider OER for teaching and learning are:

- They are in line with academic traditions of sharing knowledge and are a good thing to do;
- They enable institutions to give something back to taxpayers by allowing free sharing and reuse of resources;
- It is good for the institution's public relations to have an OER project as a showcase for attracting new students;

- Open sharing will speed up the development of new learning resources, stimulate internal improvement, innovation and reuse and help the institution to keep good records of materials and their internal and external use (OECD, 2007, p. 11).

Educators in general can also take advantage of OER. They can have access to a growing range of resources that can be built and/or used to update and revise existing learning content (Bossu & Tynan, 2011; Caswell, et al., 2008). Most importantly, OER can assist educators to reduce teaching preparation time, avoid duplication and concentrate their efforts on making students' learning a more rewarding experience (Johnson, et al., 2010; Willems & Bossu, 2012). Nevertheless, formal and informal learners can gain the most advantage from the adoption and use of OER because they are accessible; provide learners with flexibility to study anywhere and anytime; at no or low costs; and have the potential to contribute to informal, non-formal and formal education (Bossu & Tynan, 2011; Kanwar, et al., 2010; Panke, 2011; Schuwer & Mulder, 2009). Other benefits for learners are the interaction with content and the sharing of knowledge with other learners, "following personal learning goals and encountering different points of view" (Panke, 2011, p. 5).

In addition, OER can also be used by a whole range of professionals and their employers across different areas as free resources for professional development (Bossu & Tynan, 2011), as well as by governments to meet their current political agendas (Bossu, Bull, & Brown, 2012). Even though OER have the potential to benefit a whole range of stakeholders, from institutions to both formal and informal learners, the impact of OER on the higher education sector is not fully understood yet. In fact, research has shown that little is known about how teachers and learners use, repurpose and interact with OER (Panke, 2011). What is known, however, is that both educators and learners appear to have a limited understanding of OER for teaching and learning, whether formal or informal (Conole & Weller, 2008; Panke, 2011). This seems also to be the case in Australian higher education (Bossu, et al., 2011), which is discussed further in this paper.

The above is not the only challenge that the OER movement faces. Despite the continued growth, success and evident benefits of the OER movement, a range of issues remains unresolved. Some of these issues have existed since the early stages of the movement and are widely discussed in the body of knowledge regarding OER. Other issues have emerged recently, as the movement matures and evolves. Some challenges at an institutional level include copyright and intellectual property policies and a lack of awareness regarding OER. Institutional barriers also include a lack of incentives from institutions toward staff and their use and development of OER (Atkins, et al., 2007; Bossu & Tynan, 2011; Wiley & Gurrell, 2009). In addition, issues "regarding quality control, whether or not to support translation and localisation of resources, how to facilitate access for students with disabilities, and technical issues" need to be considered when developing an OER initiative. (Bossu & Tynan, 2011, p. 261). Many, however, believe that the sustainability of OER initiatives is perhaps the most significant issue for educational institution. Despite the fact that several sustainability models have been developed and discussed in the literature to date, there is no evidence yet of their successes. (Dholakai, King, & Baraniuk, 2006; Downes, 2007; Humbert, Rébillard, & Rennard, 2008; Lane, 2008; Schuwer & Mulder, 2009; Smith & Wang, 2007). As Smith and Wang (2007) point out, for an OER initiative to be sustainable in the long term it needs to create value for the host institution.

Some of the key challenges faced by academics in terms of the use and repurpose of OER include an evident lack of understanding regarding copyright and intellectual property issues, and where to find quality and relevant resources (Bossu & Tynan, 2011). For those who are more familiar with the licenses applied to OER, the adoption of OER into traditional educational contexts would still require academics to "pay attention to a layer of their instruction beyond what is simply pedagogically sound" (Caswell, et al., 2008, p. 8). The non-invented-here syndrome is another problem, as some believe that "material developed or chosen by someone else is commonly judged to be inferior" (McGreal, 2010, p. 3). As for learners, contextual barriers can pose a substantial challenge to the adoption of OER due to different students needs and capabilities (Kanwar, et al., 2010; Willems & Bossu, 2012). Additionally, adequate access to Internet connection, computer skills and relevant OER are all challenges faced by many learners worldwide (Willems & Bossu, 2012). For an OER project to be successful the above and other issues must be taken into account.

It can be seen from the discussion above that there are advantages, but also challenges still to be overcome by the OER movement, which is still in its infancy in Australia. Attention to the issues mentioned above needs to be paid by educational institutions and government bodies in order to appropriately adopt OER in Australia, so they can bring educational benefits to educational institutions, educators and learners.

The remainder of this paper will present some of the preliminary findings on the benefits and challenges of OER of a research project funded by the Office for Learning and Teaching (OLT) titled “Adoption, use and management of Open Educational Resources to enhance teaching and learning in Australia”.

The Research Project

This is the second year of a two-year research project. The first year involved a comprehensive analysis of the relevant literature surrounding OER internationally and nationally, the collection of institutional and national educational policies and frameworks that enable OER practices and development. Also, an online survey and subsequent interviews were conducted targeting a whole range of higher education stakeholders across Australia. We are currently conducting a analysis of the data, which will provide the basis of a “Feasibility Protocol” to enable and facilitate the adoption, use and management of Open Educational Resources (OER) for learning and teaching within higher education (HE) institutions in Australia. The Feasibility Protocol will prompt questions and raise issues that need to be considered by institutions wishing to enter the OER movement. With narratives and discussions from the data analysis, examples of practices and literature review, this protocol aims to assist senior executive managers and others to make informed decisions within their institutions regarding how to approach the adoption of OER.

Research Findings

Data Sample

The online survey was distributed to all major higher education organisation mailing lists in the Australasian region. Personal invitations were also sent to the PVC’s/DVC’s at all Australian universities and to other professional contacts. Each team member also forwarded the invitation to known colleagues within the sector.

The survey resulted in 101 valid responses from across 37 educational institutions, with representation from all states and territories in Australia, and from the stakeholder groups related to this research. There was also a balanced gender distribution amongst the respondents: 48% male and 51% female. The sample also had a good representation of university stakeholders groups, from senior executives (23 participants) to managers (13), educators (28), curriculum designers (14), professional developers (6), library professionals (4) and copyright officers (2).

From the 101 survey respondents, 24 offered to be interviewed. The 24 interview participants were from 18 different Australian institutions. The table below shows the stakeholder groups who participated in the interviews.

Table 1: Stakeholder groups who participate in the interviews

Stakeholder groups	Number of participants
Copyright officer	2
Educator (teacher, lecturer, tutor or trainer)	5
Technologist	1
Other Manager or Administrator	9
Executive (eg. DVC, PVC)	4
Instructional / curriculum designer	3

Current state of play of OER in Australian higher education

The reasonable number of survey respondents have been aware of the OER movement from two to five years (41%) and rated their knowledge of OER as intermediate (51%). However, the majority of participants have rarely or never used OER. As for those who have adopted OER, learning objects have been the most preferred type of resources applied in teaching and learning. Also, most participants declared that they are not involved in collaborative OER initiatives either nationally or internationally. However, they indicated that they would like to be involved in OER activities in the future if the opportunity arises. The lack of adoption and participants’ involvement in such activities could be due to the fact that OER practices and initiatives are not included in the current strategic plans of most participating institutions, as declared by the participants. In addition, survey data also revealed that government policies are necessary to regulate the adoption of OER in

Australia and that dedicated OER public policies could encourage the growth, development and institutional adoption of open educational resources and practices across the sector in Australia. Even though the efforts of some individual OER initiatives have succeeded at the institutional level in Australia, as mentioned previously, the movement has expanded faster and more effectively in countries where support was provided at the national level. Particularly in Australia, this support could come in the form of more flexible policies. According to participants, the Australian government should also support higher educational institutions through grants or financial awards to encourage the development of OER, together with a culture of open practices (Bossu, et al., 2011).

As for institutional policies, they were considered an important factor to promote the effective use and adoption of OER. According to the participants, educational institutional should develop policies and activities to promote OER awareness and to clarify issues related to intellectual property and quality assurance. Institutions should also promote and recognise OER initiatives, and this could also occur through financial initiatives. This was also true in studies undertaken in Europe and other parts of the world (OECD, 2007; OPAL, 2011). In fact, many have alerted institutional policy-makers of the existing institutional strategies to the adoption of OER, and that these strategies could be implemented through appropriate internal regulations and guidelines (Atkins, et al., 2007; Downes, 2007; Kanwar, et al., 2010).

In the interviews, participants' level of understanding of OER within the sample group was high, but it must be taken into account that the sample was obtained from volunteers who completed the online survey and were comfortable to be questioned about issues surrounding OER. Thus, this level of understanding was to be expected. Likewise, most of interviewees (with the exception of two) were aware of the Creative Commons licenses. It appeared that many university employees from various institutions were using these licenses, but these practices were not formally endorsed, or were not specified within current policies. Most interviewees (62%) use OER for both personal and professional purposes. It was of interest to note that this usage was not widely adopted in any of their institutions. Very few participants make their resources available, and even fewer specifically create OER. Most respondents were aware of only a handful of colleagues using OER within their institutions. When asked what they thought were the main concerns of those people not using OER the main responses were potential loss of intellectual property, fear of exposure and lack of awareness.

> One concern is that openness obviously exposes poor practice and you won't find many people admitting to that concern but I daresay it is a major concern.
>
> Educator

Advantages and challenges of OER in Australian HE

Advantages
In terms of the benefits that OER can bring to education and training in Australia, the majority (highest to the lowest) of survey participants' views are that:

- Educators can save time and avoid duplication of effort.
- OER can improve the quality of educational learning materials.
- OER have the potential to increase collaboration within an institution and internationally.
- OER help to enhance quality of teaching and learning in higher education.
- An OER project is a good marketing strategy to showcase the institution and attract new students.
- An OER project will raise the international profile of an institution within the global community.

Also, they believe that OER use is a catalyst for institutional innovation (53) and that the use of OER has the potential to lead to new pedagogical practices (44) within higher education institutions in Australia. Interviewees pointed out (62%) that social improvements and "access to education for all" are potential benefits of OER. Other potential benefits identified by respondents include increasing efficiency in time and/or money (50%) and improvement of the quality of teaching resources (42%). They stated that teaching materials undergoing a review process could only improve in quality. Increasing collaboration was also mentioned by over a third of the respondents as another benefit of OER (37%).

> It could provide a built-in quality assurance model. I mean people don't want to put their name to crap, so if they're going to create it, they're going to create it to be reviewed by their peers, so it's going to be good.
>
> Educator

> I'm excited about the prospect of sharing resources with other academics and other faculties within Australia and overseas. I think that not only encourages better collaboration, encourage a new way of thinking for academics.
>
> Educator

> The total would be much greater than the sum of its parts.
>
> Manager

Challenges

When asked to indicate the potential barriers to the use of OER, survey participants pointed out that the lack interest in creating and using OER and poor quality of OER were considered as important factors by the majority of them. Survey respondents also identified that insufficient institutional support, and the lack of institutional policies to address OER developments, as barriers to the growth of the OER movement, amongst other barriers (Please see figure 1).

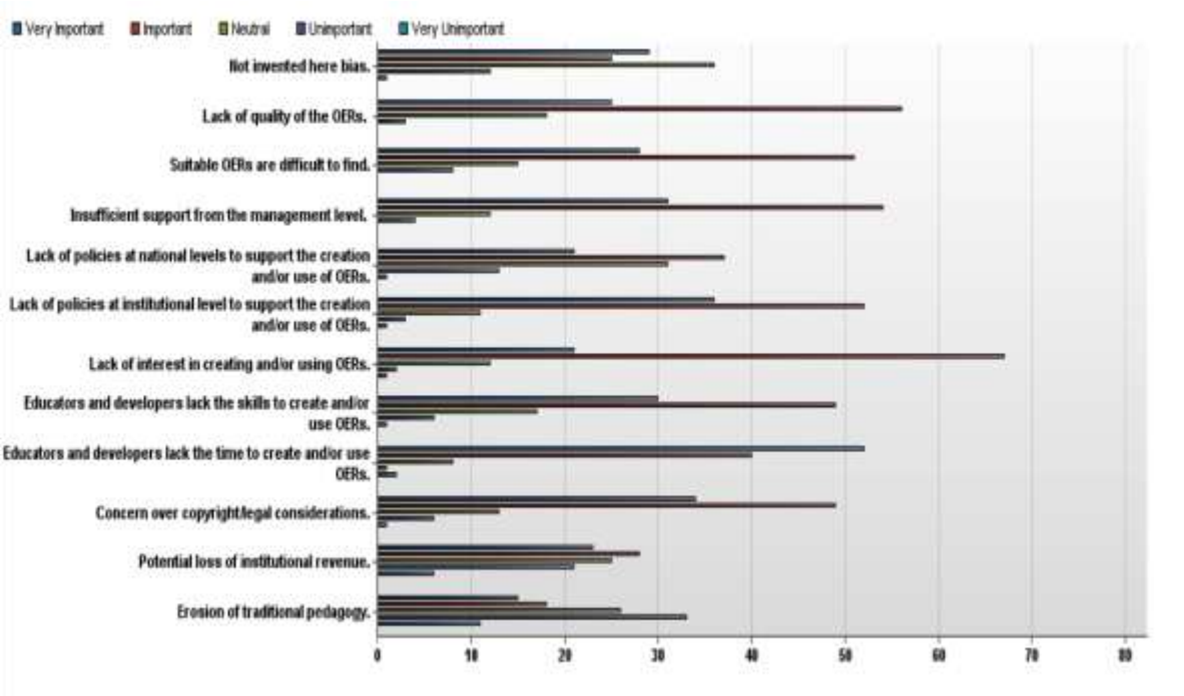

Figure 1: Potential barriers to the use of OER

Common barriers to OER use identified by the interview participants were issues related to intellectual property policies and the lack of a national framework to support these. Problems surrounding quality, current academic culture and lack of knowledge were among the other significant barriers identified. When questioned further, participants stated that limited funding, difficulties in changing academic culture and discoverability of OER were considered to be the major challenges. Several of the respondents suggested that adopting a standardised metadata for OER and/or a national or institutional repository as potential solutions to assist with the discoverability issue. In fact, 70% of the interviewees believed that OER could be more widely used within universities if appropriate support regarding where to find quality OER, and how to use them adequately, were to be provided. Implementing some sort of recognition for those who use/create OER was also identified by 33% as a way to encourage the adoption of OER, followed by the development of policies.

> So if I knew there was somebody who was the "go-to person" to ask that would be helpful.
>
> Educator

> …someone able to tell staff and teach them about licensing and give them options and all the other little things that you would need to do to embed it [OER] and embrace it more fully.
>
> Director

Discussion and Conclusion

This paper explored some recent OER developments within higher education institutions in Australia, as well as several attempts to make available publicly funded research, resources and government information through federal open access policies. Unfortunately, the adoption of OER within mainstream education in Australia appears to be limited, perhaps due to the lack of educationally focused policies and initiatives, as demonstrated by the research described here.

It can be seen by the findings presented here that some of the advantages and challenges of the OER movement reported in the literature are similar to those raised by the participants in this study. It is interesting to note, however, that even though most participants were aware of the movement, very few actually adopt OER. The lack of OER uptake by the participants could be closely related to their lack of interest linked to their busy workload and lack of institutional support. For academics OER could represent another activity added to their already heavy workloads. In order to encourage the adoption of OER, educational institutions need to provide support and develop new reward systems, where academic staff can receive recognition for their involvement with OER.

However, it is known that fundamental changes in the higher educational landscape tend to occur at a gradual pace and attract many sceptics. Despite the benefits that the OER movement can bring to higher education in Australia, there are still several challenges to overcome. Delay in the introduction of OER in mainstream education in Australia, could slow educational collaboration and innovation. One can then conclude that OER represent both additional challenges and advantages in the current clime of change of higher education sector in Australia.

This paper provides an overview of media-rich real-time collaboration tool use for learning and teaching in Australian and New Zealand universities. These tools, which include video conferencing tools, web conferencing tools and virtual worlds, afford students and teachers the ability to synchronously represent concepts, and enable them to interact with one another to negotiate meaning and develop a sense of connectedness. A survey of 750 higher educators revealed that while desktop video conferencing and web conferencing use display an upward trend, virtual worlds are being used by substantially fewer educators, and have recently begun to experience a decline in usage. There are four major web conferencing products being used, whereas desktop video conferencing and virtual worlds are each being dominated by a single product. The 'best' uses of each technology as perceived by respondents with experience in a range of tools are examined, before the paper concludes with a discussion of implications for tertiary learning and teaching, along with an outline of the authors' future plans.

Keywords: video conferencing, web conferencing, virtual worlds, rich media, synchronous

Introduction

The study schedules of today's Australian and New Zealand university students typically have to compete with their intensive work, family and social commitments (James, Krause & Jennings, 2010). As a consequence, many students are finding it increasingly difficult to attend university campuses on a regular basis (Gosper, Green, McNeill, Phillips, Preston & Woo, 2008). In order to cater for these students, universities have turned to a range of online learning technologies, including enterprise learning management systems, such as *Blackboard*, *Moodle* and *Sakai*, as well as externally hosted Web 2.0 tools, such as *YouTube*, *Facebook* and *Wikispaces*. These technologies provide students studying in distance mode, as well as those enrolled in on-campus mode but not able to regularly come to classes, with access to resources like reading materials, lecture recordings and podcasts and give them the ability to communicate asynchronously with their lecturers and peers. However, these students miss out on the real-time collaborative learning opportunities availed to their face-to-face counterparts.

Media-rich real-time collaboration tools have the potential to help address this issue. Such tools, which include video conferencing tools (e.g. *Skype*), web conferencing tools (e.g. *Adobe Connect*, *Wimba*, *Blackboard Collaborate*) and virtual worlds (e.g. *Second Life*), are increasingly being used to bring together on-campus and geographically dispersed students, and are arguably already providing remote tertiary students with unprecedented flexibility to participate in on-campus collaborative learning activities. Stewart, Harlow and DeBacco (2011) believe these contemporary technologies are able to offer universities new solutions to existing problems, such as preparing students for the 21st-century workplace, attracting students to university (especially underrepresented populations of students) and providing opportunities for leader/expert collaboration. Initiatives such as the Australian National Broadband Network will only serve to increase the quality of experience and prevalence of media-rich synchronous tool usage.

There is a range of somewhat outdated and speculative data on media-rich real-time collaboration tool usage. US research on distance education courses identified that only 23% of courses used two-way interactive video and 31% used synchronous Internet-based technologies (Parsad & Lewis, 2008). Researchers in the Australian context acknowledge that while media-rich technologies that facilitate interactive communication between users synchronously or asynchronously offer great promise to enhance student–student and student–teacher communication, they are not as widely used as they could be (Smyth, Andrews, Bordujenko & Caladine, 2011). Because the literature in the area is, to a large degree, uncharted and unorganised, universities are tending to work in isolation – often without an understanding of current practice in other institutions, and with unnecessary duplication of effort – to make technology usage and selection decisions.

This paper presents selected findings from a 2011-2012 Australasian survey investigating the use of media-rich real-time collaboration tools in higher education, with the goal of offering a reference point for the selection and deployment of such tools. An up-to-date understanding of media-rich synchronous technologies and how they can be used enables educators to support contemporary learning and teaching approaches as well as become more innovative pedagogical leaders into the future. This research has been undertaken as part of a project funded by the Office of Learning and Teaching (previously the Australian Learning and Teaching Council) aimed at investigating how media-rich real-time collaboration tools can be used to synchronously bring together remote and face-to-face students (Bower, Kennedy, Dalgarno & Lee, 2011). Please refer to the *Blended Synchronous Learning* website at http://www.blendsync.org/ for more details about the broader project.

Media-rich real-time collaboration tools and their use in higher education

There are three main types of technologies that educators can use to offer media-rich synchronous learning experiences to remote and face-to-face students: video conferencing, web conferencing and virtual worlds.

Video conferencing

Video conferencing systems allow for synchronous audio and video feeds to be transmitted between sites so that each user or group of users can see and hear the other users. Traditionally, dedicated room or lecture theatre-based systems were required, and such systems have been used for some time to simultaneously deliver lectures to students based at multiple campuses. More recently, desktop video conferencing applications such as *Skype* have become available that allow for live audio and video interactions between remote participants using webcams and microphones attached their desktop or laptop computers. Such systems have gradually introduced additional tools, such as instant messaging, file transfer and sharing of desktop computer images.

The use of video conferencing is largely underpinned by the premise that “visual signals improve human interaction” (Fullwood & Doherty-Sneddon, 2006, p. 168). Video conferencing can facilitate informal communication, unplanned interactions at distance and an arrival at shared understanding by participants (Parker & Joyner, 1995). Students appreciate how video conferencing can reduce commute time and increase real-world skills (Koenig, 2010). Video conferencing provides an effective way to promote a sense of connectedness with overseas students as universities compete to internationalise their programs (Kan, 2011). Stewart et al. (2011, p. 358) contend that “productive learning occurs through conversations among students and faculty who create knowledge together, in real-time, without [necessarily] physically being together in the same place”. A variety of communicative patterns are possible with video conferencing, among which are ‘voice switching’ (a ‘free-for-all’ situation in which the ‘floor’ is passed to the person speaking at a given moment) and ‘chairing’ (where the ‘floor’ is allocated to an individual by the chair of the meeting) (Parker & Joyner, 1995). Where faculty were good communicators and able to keep students involved, the classes were deemed to be “equally as engaging as traditional classroom delivery” (Koenig, 2010, p. 2).

Web conferencing

Web conferencing tools allow groups of users to enter a shared online space where they can use features such as whiteboards, screen sharing, chat, voting, file sharing and collaborative authoring facilities together in real-time from within their web browsers. Almpanins, Miller, Ross, Price and James (2011, p. 317) describe synchronous web conferencing environments as a “virtual classroom” and “the digital version of a classroom meeting” (p. 317). Interaction is facilitated through different modalities such as text chat, audio streaming, video streaming and desktop sharing (Steed & Vigrass, 2011). Typical functionalities include the ability to display PowerPoint presentations, broadcast webcam video and voice, exchange files, vote, write shared notes, and collaboratively draw on a whiteboard (Bower, 2011). Screen sharing to display visual materials can considerably enhance the learning experience (Steed & Vigrass, 2011). Social presence and responses are facilitated by a variety of emoticons and voting features providing a mix of communication and participant management modes, with multiple group work instances supported by ‘breakout’ rooms (Todhunter & Pettigrew, 2008). There has been a gradual merging of functionality between web conferencing and desktop video conferencing systems, so that many of the features of one are now also found in the other.

The use of web conferencing systems is a response to the general need to engage students with rich and/or synchronous online learning settings (Spanier, 2011). Web conferencing creates opportunities for geographically dispersed peers or colleagues to communicate across space (Reushle & Loch, 2008). There is growing evidence of cohesive strategies to develop web conferencing approaches within and across institutions. In Norway, the *Adobe Connect* web conferencing platform has been made available to all educational providers through Uninett, the Norwegian Education Institutional Network. Proponents of web conferencing argue for broad and strategic adoption within universities that maximises potential benefits to the institution and avails students and staff lasting open access (de Groot, Harrison & Shaw, 2011). Notwithstanding the increased uptake and use of these tools in recent years, there remains a need for a deeper and more nuanced understanding of how to make use of them in pedagogically sound and effective ways (Munkvold, Khazanchi & Zigurs, 2011).

Virtual worlds

Virtual worlds are online representations of physical environments in which users can move around and interact with other objects and users, usually in three dimensions. Virtual worlds permit rich actions and interactions, including the ability for users to exchange messages and objects with other users, see one another’s avatars interacting with the environment, and ‘experience’ the world through touch, voice communication and engagement in quests (Messinger, Stroulia & Lyons, 2008). Hew and Cheung (2010) note the three defining features of virtual worlds reported in the literature and add a fourth. The first three include ‘the illusion of 3-D space, avatars that serve as visual representations of users and an interactive chat tool for users to communicate with one another’ (Dickey, 2005, cited in Hew & Cheung, 2010, p. 34). The fourth important feature adds the ability for a user to ‘act’ on the world by using object properties in the virtual world and, by implication, enable learning by doing rather than by listening or reading a possibility for students (Hew & Cheung, 2010). As well as free navigation in a first-person perspective, virtual worlds also provide natural semantics in the place of symbolisms, and the ability to vary physical size to experience micro or macro environments that are beyond the normal human range (Mikropoulos & Natsis, 2011).

Virtual worlds afford learning tasks that can lead to enhanced spatial knowledge representation and increased intrinsic motivation and engagement as well as learning that is experiential, contextualised and collaborative (Dalgarno & Lee, 2010). Lim (2009) has proposed a ‘Six Learnings’ framework that highlights the breadth of potential learning designs that can be instantiated in virtual worlds, including exploration, collaboration, role-play, building, championing and expressing. The digital replication of real experience creates immersive presence that can give rise to learning through situated experiences and multiple perspectives, thus leading to greater transfer of learning to other contexts (Dede, 2009). The ability to provide different levels of structure and scaffolding for tasks enacted in virtual worlds gives teachers a degree of pedagogical control (Jacobson, Kim, Miao, Shen & Chavez, 2010). While there are issues associated with the integration of virtual worlds in a higher education setting, including a range of technical, cultural, interactional, economic, scheduling, standards, scaffolding persistence, social and identity-related issues (Warburton, 2009), the overwhelming majority of virtual world educators found using virtual worlds positively impacted on their students’ learning (Dalgarno, Lee, Carlson, Gregory & Tynan, 2011b).

The literature relating to the use of media-rich real-time collaboration tools such desktop video conferencing, web conferencing and virtual worlds is not only fragmented between these sub-areas, but also within them. It is difficult to find data that present an overview of the different sorts of tools that are being used and the relative prevalence of each. The current survey was conducted in 2011-2012 to address this gap, particularly with respect to the Australian and New Zealand higher education sector. This paper shares results of the survey to document how educators in Australian and New Zealand universities use media-rich real-time collaboration tools, the particular tools they are using, and their perceptions of the ways in which these tools are best used.

Method

Materials

The survey designed for this investigation contained three substantive sections. The first section included general demographic questions as well as items relating to years of experience in teaching, in using computers and the Internet for teaching, and in teaching using media-rich real-time collaboration tools. This section also asked respondents to rate their expertise in using computers and the Internet and in using media-rich real-time collaboration tools on a five-point scale from ‘beginner’ to ‘expert’. The second section asked respondents which desktop video conferencing, room-based video conferencing, web conferencing and virtual world tools/platforms they had used and/or planned to use, as well as the circumstances under which they felt each type of technology was most appropriately used. In the third section of the survey, respondents were asked to provide detailed information about one subject or unit in which they had deployed media-rich real-time collaboration tools, with a focus on their use of the tools for synchronously uniting face-to-face and remote students, where applicable. The results from that section will be reported in separate publications.

Procedures

Respondents were recruited by advertising on national and international educational technology mailing lists (e.g. ascilite, HERDSA, ODLAA, DEANZ, ACODE, EDUCAUSE, ITForum) and through personal contact made by the members of the project team. A $300AUD shopping voucher was offered as an incentive to complete the survey. The survey was delivered online from early December 2011 to late February 2012. Upon closure of the survey, all data were extracted as Excel files and quantitative data was analysed in SPSS.

Open-ended responses to the questions about appropriate uses of desktop video conferencing, web conferencing and virtual worlds were also analysed in order to provide a grounded indication of the circumstances under which the respondents believed each tool can and should be used. A cluster analysis was performed and among other things revealed that one group of respondents distinguished themselves by using a broad range of technologies. Responses from 100 people in this group were selected for detailed qualitative analysis, on the basis that they had the range of experience upon which to base selection and usage decisions. This qualitative analysis involved an open-coding phase to determine preliminary analytic categories, an axial-coding phase to determine emergent themes, and a selective-coding phase to support the conceptual coding categories (see Neuman, 2006, for further details on this approach).

Respondents

A total of 1,748 survey responses were received. After removing responses that were largely incomplete, not from an employee of an Australian or New Zealand university, or from someone who indicated that they were not using any media-rich real-time collaboration tools, 750 responses remained. Of these 750 responses that were used for the current analysis slightly more were from females than males (females: 54.2%; males: 45.8%). There was a wide range of ages in the sample (from under 26 years of age to over 65 years of age) and the mean age of respondents was approximately 48 years (based on the midpoints of the response ranges). The distribution of ages is reflective of that of the university sector, which tends to be positively skewed (i.e. comprising an older demographic). Responses were received from 38 of the 39 Australian universities and all 8 of the New Zealand universities.

Of the 750 respondents, the majority had been teaching in tertiary/higher education for 10 or more years (58%), and had 10 or more years’ experience using computers and the Internet in their teaching (57%). On the other hand, only 14% of respondents had been using media-rich real-time collaboration tools for 10 or more years, and the majority (58%) had been using them for less than 5 years. A substantial number indicated that they had adopted these tools within the last year (24%) or in the past 1 to 2 years (14%). There were clear differences in the self-reported abilities of respondents when it came to using technology more generally for learning and teaching compared with using media-rich real-time collaboration tools. Over two-thirds of respondents (68%) indicated they had ‘advanced’ or ‘expert’ ability in using computers and/or the Internet for learning and teaching, while less than a third (31%) felt they had the same level of ability when it came to using media-rich real-time collaboration tools for learning and teaching. Conversely, very few respondents reported being beginners or novices when it came to using computers and/or the Internet for learning and teaching (3.3%), while a significant minority (34%) felt they were at the beginner or novice level in the use of media-rich real-time collaboration tools for learning and teaching.

Results

General use of media-rich real-time collaboration tools

Respondents were asked to indicate which media-rich real-time collaboration tools they had used in the past or were currently using in their teaching. (They were given a list of 38 tools to choose from, and also allowed to specify additional tools that did not appear in the list.) These responses were classified into four more generic categories or types of tools: desktop video conferencing, room-based video conferencing, web conferencing and virtual worlds. Across the 750 respondents, there were 2,926 instances of media-rich synchronous collaboration tool use, representing an average of approximately four tools per respondent. As can be seen from Figure 1, desktop video conferencing (39.4%) and web conferencing (38.6%) were the two tool categories that were most used. There were fewer instances of room-based video conferencing (11.7%) and virtual world (7.4%) use.

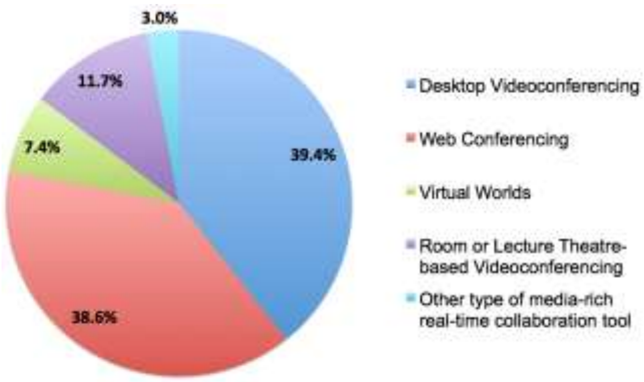

Figure 1: Percentage of uses of each type of media-rich real-time collaboration tool

In an attempt to track the use of media-rich real-time collaboration tools over time, respondents were asked to indicate the years in which they had used each of the four more generic categories of tool (see Figure 2). Figure 2 shows that the adoption of all media-rich real-time collaboration tools has increased significantly since 2000. But more interesting is the relative use of each type of tool. Room-based videoconferencing was clearly the dominant technology for media-rich real-time communication in 2000, and maintained this position at least until 2003. From 2004 to 2008 there was, broadly speaking, comparable use of room-based videoconferencing, web conferencing and desktop conferencing. From 2009 to 2010, web conferencing and desktop video conferencing tools were used by more respondents than room-based video conferencing. and the usage of these tools approximately doubled between 2008 and 2010. Moreover, while all four technologies have seen progressive growth in their user base, it is clear virtual worlds do not enjoy the penetration of the other three technologies, and even show a slight decrease in usage from 2010 to 2011. This may be in part be explained by the existence of a number of barriers to usage and institutional support issues associated with virtual worlds (see Dalgarno et al., 2011b) as compared to web conferencing in particular, which tends to be institutionally supported.

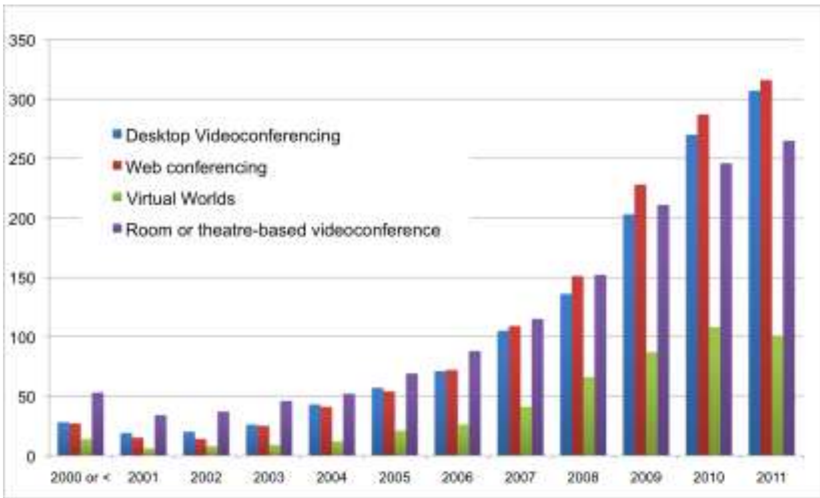

Figure 2: Use of media-rich real-time collaboration tools by year

Specific use of media-rich real-time collaboration tools

The next series of analyses examined the specific products that respondents were using with their students. Figure 3 shows the percentage of respondents in the sample that used specific web conferencing tools. It can be seen from Figure 3 that four tools in the web conferencing category are enjoying especially healthy patronage: *Elluminate* (30.9%), *Blackboard Collaborate* (30.6%), *Wimba* (20.8%) and *Adobe Connect* (20.5%). It is noteworthy that *Elluminate* was acquired by Blackboard, Inc. in 2010 and rebadged as *Blackboard Collaborate*. It is therefore likely that some respondents would have used *Elluminate* but not *Blackboard Collaborate*, some would have recently switched from *Elluminate* to *Blackboard Collaborate* within their institution, and others would have adopted *Blackboard Collaborate* without having previously used *Elluminate*. A consequence of this is that collectively, the proportion of people using either *Elluminate* or *Blackboard Collaborate* may well be substantially larger than 30%. Additionally, *Wimba* has been taken over by Blackboard, and although it continues to be supported as a separate product (see Wimba, Inc., 2010), it appears highly probable that there will be further consolidation of web conferencing platforms in the future.

Figure 4 displays the percentage of respondents using each of the tools in the desktop video conferencing category. Clearly *Skype* is the most popular tool, with 59.1% of respondents indicating they had used this tool in their teaching, which is double the number of users of the most popular web conferencing tool. *Windows Live Messenger* (16.0%), *Google Voice and Video Chat* (12.5%) and *Yahoo! Messenger* (9.8%) enjoyed moderate use. The proportion of respondents using each virtual world platform is depicted in Figure 5. It shows that use of virtual worlds is low compared to the other media-rich real-time collaboration tools. *Second Life* is the only tool with a significant user base, and even then it represents only 14.9% of the sample. It is noteworthy that with Linden Labs recent substantial increase in the cost of land in *Second Life* to educators, interest in *OpenSim* has grown, and a number of third-party grid providers have emerged (see Dalgarno et al., 2011a). Consequently, it could be assumed that the user base of *OpenSim* will continue to grow over the next few years.

Perceived 'best' use of media-rich real-time collaboration tools

Based on an initial analysis of the open-ended responses to questions asking respondents to list the best reasons for using each of the three main technologies (video conferencing, web conferencing and virtual worlds) for learning and teaching, some of the more common reasons for using the technologies are discussed in this section. Quotes from the actual responses are included to help illustrate the general categories of response identified. A more complete analysis of all responses will be reported in another publication.

Reasons for using desktop video conferencing often centred around location and group size. Desktop video conferencing was deemed useful when participants were "geographically dispersed" and the planned interaction was either "one-on-one" or for "small groups". There was widespread agreement that desktop video conferencing was ideal when participants "do not require much more than audio and video capabilities to support teaching and learning". Several respondents pointed out that desktop video conferencing was important when "visual interaction is required", for instance if "the subtle nuances of facial expression is important".

Some indicated that desktop video conferencing could be useful for developing a sense of "social presence and community", particularly "with off-campus students to give them a more inclusive and intimate experience".

Pedagogical situations considered by respondents to lend themselves to the use of desktop video conferencing included facilitating collaboration during project work, providing consultation hours, liaising with postgraduate and higher degree research students, and enabling online talks by guest speakers. The lightweight and easy-to-use nature of the software meant that some respondents felt desktop video conferencing was suitable for brief communication events and "informal" teaching situations, such as remedial instruction or question-and-answer sessions before exams, and checking in with students "in the field". Some responses underscored the pedagogical impact of using desktop video conferencing, including that it could be used to increase the level of interaction, engagement and motivation. Desktop video conferencing was viewed as a tool for facilitating "learning conversations" and "dialogic pedagogies". Several respondents alluded to the power of placing desktop video conferencing technology in the hands of the students to enable "student-to-student interactions".

Web conferencing was seen to cater to a far greater variety of group sizes – anywhere from small groups, to tutorial-sized groups, to larger classes of "up to 100". Several responses highlighted the flexibility of web conferencing; that it "can be used in almost any situation". One respondent identified web conferencing as being suited to "1) small group situations when the purpose is to engage in learning conversations and question and answer discussions after a short presentation using relevant slides, 2) guest presentations and webinars when the

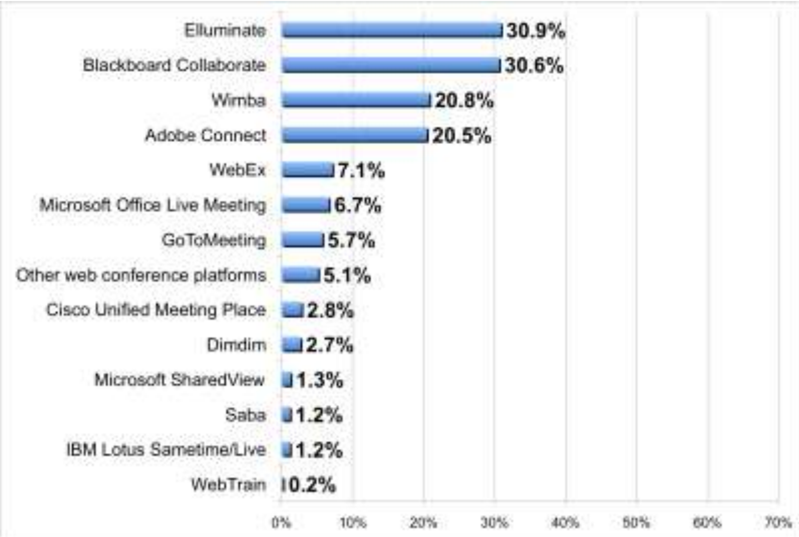

Figure 3: Percentage of respondents using a range of web conferencing tools

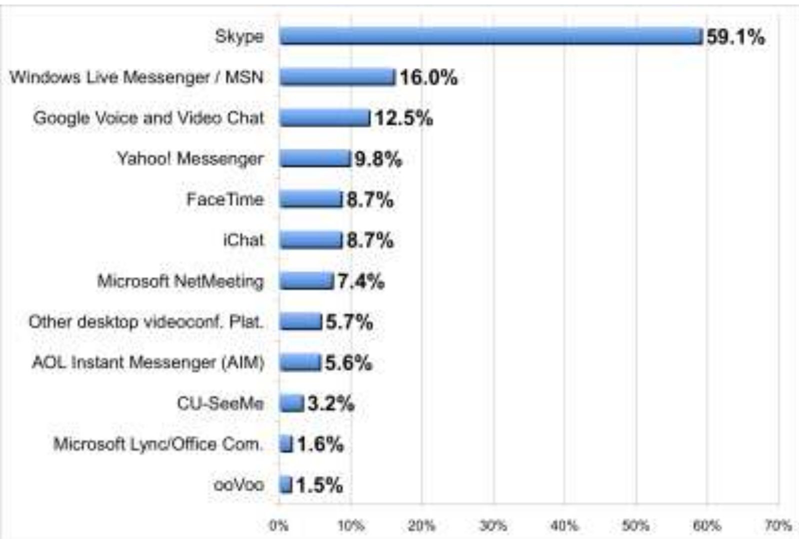

Figure 4: Percentage of respondents using a range of desktop video conferencing tools

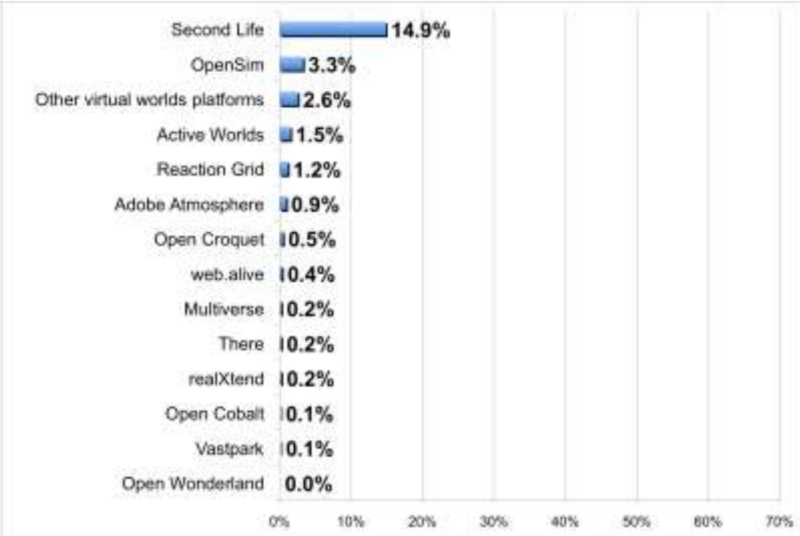

Figure 5: Percentage of respondents using a range of virtual world platforms

audience is geographically dispersed and they would be able to attend in person, 3) student presentations and small group work". Other uses perceived as appropriate included lectures, student project collaboration, student presentations, providing online consultation hours, and briefs to large distance cohorts on assessment tasks. Some respondents expressed a view that web conferencing had the potential to transform pedagogy, for instance by using the separate audio and text channels to "allow more tutorial-style chat rather than a straight lecture".

Several respondents related the selection of web conferencing to whether or not it afforded the required tools for the learning and teaching situation. For instance, one respondent indicated web conferencing was useful when "enhanced functionality such as screen sharing, voting, content sharing and collaboration are required". Other suitable uses included "sharing files, PowerPoints etc plus real-time discussion… developing shared understandings through whiteboard activities". Some respondents also identified the capacity to use "breakout rooms" as a distinct advantage for groupwork. Whereas desktop video conferencing was seen more as a tool that was used more incidentally, some people identified that for web conferencing sessions the presenter needed to be prepared. For instance, one respondent indicated that for large groups web conferencing "relies on well-organised and planned use by moderator", but that even small groups also require "planning and practice if a formal session". One respondent remarked that "the advantage of web-based conferencing programs is that the students can fully interact with the academic, other students *and the subject material*" (emphasis added). Like desktop video conferencing, web conferencing was also seen as a way to "enhance sense of belonging to group", where the persistent nature of rooms could provide "sustainable connections for communities of practice".

Virtual worlds were viewed by many of the respondents as a way to overcome limitations of the physical world, or in the words of one individual, "doing things that can't be done in the physical space for technical/legal/safety/practical reasons, e.g. simulate dangerous equipment, processes etc". Often, pragmatic reasons (such as financial considerations) were seen as a driver for choosing to use virtual worlds: "time, money and inability to do in real life are other excellent reasons to use a virtual world", an example of this being "exploration of environments not otherwise available due to size or cost or distance – e.g. exploring nano spaces or designing sustainable buildings or visiting virtual museums". In contrast to video conferencing and web conferencing, virtual worlds were seen as a way to provide a more "immersive" experience. One respondent saw as an advantage of virtual worlds the fact that students could choose to remain anonymous, and another felt virtual worlds could be used to nurture the social skills of some students who might lack confidence. Respondents rarely identified group size as a factor when deciding to use virtual worlds.

Some respondents felt that the range of uses of virtual worlds was almost limitless, with some of the many possibilities including "lectures, discussions, guest presenters, WebQuests, scenario-based training, simulations, role-plays, tours, excursions, bring[ing] people together from dispersed/remote locations, meeting experts from around the world, group work, collaboration, one-to-one [and] one-to-many synchronous work, asynchronous learning, only limited by your imagination". Other suggested uses included virtual field trips, demonstrations, conferences, decision-making scenarios, as well as problem-based learning activities. Virtual worlds were seen as useful to facilitate game-based learning, and for assessment purposes. Some felt that virtual worlds tended to be more "discipline based", for instance developing "clinical skills" in health-related disciplines, and in visiospatial disciplines such as creative arts and architecture. Virtual worlds were also seen as valuable for “language learning” and “cross-cultural collaboration”.

There was a range of comments relating to the technological requirements for and capabilities of each type of tool. The general consensus of these comments was that desktop video conferencing was easier to use than web conferencing, which in turn were seen as having a lower technical overhead than virtual worlds.

Discussion

Higher education institutions often make decisions about media-rich real-time collaboration technology deployment without any clear understanding of the tools that are available or how they are being used. Literature relating to these technologies is somewhat disjointed, meaning it is difficult to piece together a unified conception of the use of these technologies across the sector. This paper adds to the literature by providing an overview of how rich-media synchronous technologies are being used in Australian and New Zealand universities for learning and teaching purposes.

Based on the sample of 750 university teachers, desktop video conferencing and web conferencing are the most frequently used type of tool for learning and teaching purposes (approximately 39% each), with only 7.4% of tools identified falling into the virtual worlds category. The use of web conferencing and desktop video conferencing has more than doubled in the last four years; by contrast, the use of virtual worlds only increased by approximately 50% in the same time period, and actually declined from 2010 to 2011. The most frequently used rich-media collaboration product was the *Skype* desktop video conferencing tool, reported to have been used by 59% of respondents. The *Elluminate* and *Blackboard Collaborate* web conferencing systems were the most popular commercial tools, each enjoying 31% usage, followed by *Wimba* and *Adobe Connect*, each with 21% usage. The *Second Life* virtual world platform was the seventh most used of the tools (15% usage), slightly less popular than *Windows Live Messenger* (16%). The commercial and competitive nature of the web conferencing domain is likely to result in continued shifting of market dominance in the medium-term future, whereas desktop video conferencing and virtual worlds appear as though they will each be more or less monopolised by single products in a similar timeframe.

Responses from survey respondents with a broad range of experience teaching with media-rich real-time collaboration tools indicated that desktop video conferencing is generally most suitable for small-group and often informal sessions where audio and video are the modes of communication required. According to them, web conferencing adds the potential to cater to larger audience and enables more advanced modes of sharing (presentation slides, voting, drawing on a shared whiteboard, and use of breakout rooms for small-group discussion), but calls for greater levels of facilitator skill and preparation. Virtual worlds were essentially seen by these users as being useful as a simulation environment to overcome real-world logistics and to facilitate a more situated or contextualised and immersive learning experience.

Conclusion and future work

Eventually, improvements in telepresence technologies and associated hardware devices will mean that people from multiple locations around the world will be able to interact as though they are located in the same room. Until then, educators are tasked with the challenge of making the most of available media-rich synchronous technologies to facilitate real-time interaction between remote and on-campus learners and teachers. The findings from this study demonstrate that a range of web conferencing and desktop video conferencing tools are increasingly being used in Australian and New Zealand universities in order to achieve this interaction, with virtual worlds also being used in a smaller number of cases. It is intended that the findings from this study support higher educators and their institutions in making better-informed technology-selection decisions.

The authors plan to undertake further analysis of both the qualitative and quantitative survey data to yield deeper insight into the specific ways in which the tools are being used to simultaneously involve face-to-face and remote learners in real-time collaborative activities, as well as to identify determining factors for various clusters of users based on their tool use. The broader project of which this study forms a part is ongoing, with the project team working to develop a collection of learning design exemplars in the form of reusable templates encapsulating key pedagogical features and patterns, a technology capability framework to inform tool selection and use, and a set of practical guidelines to assist higher educators in designing media-rich real-time collaborative learning activities involving face-to-face and remote students. With reference to the survey data, six case-study implementations involving participating staff from several universities have been identified and are being followed and investigated through participatory evaluation. The project team is working closely with the case-study partners to encourage renewal and enhancement of their existing practice, with the processes and outcomes to be documented and shared for the benefit of the higher education community.

Assessment, Physical Education and Mobile Learning

Margot Bowes
MPhil- Human Movement Studies University of Queensland
Lecturer, School of Curriculum and Pedagogy
University of Auckland

Margot Bowes is a lecturer in physical education at the Faculty of Education, University of Auckland. Her research expertise, publications and teaching are in three key areas: critical pedagogies for teaching and learning in physical education; high-stakes assessment in senior school physical education (SSPE), and teacher professional learning and development (PLD). Her thesis theorised enhancing teachers' understanding of critical evaluation using the Productive Pedagogies Research (Hayes, Mills, Cristie & Lingard, 2006). She use's qualitative, interpretive methodologies and socio-cultural theories of learning as conceptual frameworks to research in her three key areas. Her most recent research interest focuses on challenging the appropriateness of predominantly written language-based theoretical work, as valid forms of assessment for SSPE that serves to reinforce the scientism of mind/body dualism in physical education (Thorburn, 2007) and often disengage students. This interactive workshop will share innovative i-assessment opportunities that CEDD and Margot are exploring in teacher education as evidence for making non-written valid judgements for assessment in NCEA.

Warren Patterson
Manager Centre for Educational Design and Development
University of Auckland

Lawrence May
Project Facilitator, Faculty of Education
University of Auckland

Intended audience and degree of expertise/past experience required

Education professionals with interests in authentic assessment and e-learning

Statement of objectives for the workshop

1. Explore and provide feedback on the innovative i-assessment strategies used in teacher education programmes
2. Share and discuss assessments that do not focus on written tasks for high stakes assessment in senior school physical education
3. Develop a professional learning community to further develop, trial and research i-assessments

Detailed description

Thirty years on from the introduction of assessed senior school physical education (SSPE) in New Zealand there appears to be a mismatch between what physical education claims to offer students with the reality for senior students and teachers around large assessment workloads, the hegemony of theory-based teaching practices and devaluing of practical teaching and learning in SSPE. This mismatch is especially poignant given the concurrent implementation of the New Zealand Curriculum (NZC) that sets challenges for teaching as inquiry and effective pedagogy. Self-directed and reflective learning that demonstrates complex, independent thinking of socio-cultural and bio-physical contexts is a desired outcome for students in Senior school Physical Education. This learning is enhanced by the curriculum objectives informing SSHPE. Hay (2006) argues that, in physical education, assessment for learning should be "based in movement and capture the cognitive and psychomotor processes involved in the competent performance of physical activities" (p. 316). This brings into question the appropriateness of predominantly written language-based theoretical work as valid forms of assessment for SSPE. NCEA and Scholarship Standards attempt to acknowledge the inter-relatedness of cognitive, physical and affective knowledge in physical education by requiring students to "apply bio-physical and socio-cultural knowledge gained through experiences in, through and about movement" (Ministry of Education, 2003, p. 1), but it could equally be argued that this form of assessment privileges written assessment over verbal and visual methods as valid forms of evidence for high stakes assessment.

This workshop will share a description of the issue of disengagement by physical educated students through the overuse of written assessment and briefly explore the theoretical underpinnings of this. The interactive workshop will explore and share innovative i-assessment, ideas using iPad applications, that we are exploring at the University of Auckland in Teacher Education, for repositioning physical education SSPE assessment as more relevant, more manageable and more engaging for physical education students and teachers. Both student and researcher perspectives will be shared with participants.

eLearning lecturer workload: working smarter or working harder?

Stephen Bright
Waikato Centre for eLearning
University of Waikato

Lecturers who move into the online learning environment often discover that the workload involved not only changes, but can be overwhelming as they cope with using digital technologies. Questions arise, given the dissatisfaction of lecturers with lowering morale and increasing workload, whether future expansion of this teaching component in tertiary institutions is sustainable. The challenge facing lecturers now, and in the future, is about learning workload management strategies which effectively manage the workload they encounter in the online learning environment. This paper describes a case study (which is a work-in-progress) examining the perceptions of online workload cf. face-to-face teaching of lecturers who are experienced in e-teaching. As well, it identifies strategies the lecturers have developed or adopted to manage this element of their workload.

Keywords: lecturer workload, workload strategies, workload management , e-teaching, elearning

eLearning lecturer workload – an overview of the literature

Literature specifically about elearning lecturer workload is relatively sparse and inconclusive. There are a number of reasons for this. Firstly, there are no systematic, comparable models for allocation of academic workload within or across tertiary institutions either in New Zealand or internationally. In some New Zealand universities a 'rule of thumb' workload approach seems to be a workload ratio for academic staff of 40:40:20 i.e. 40% teaching duties, 40% research and 20% administration. Tynan, Ryan, Hinton and Mills (2012) recently found that Australian universities have broad guidelines on workloads, and most have a workload hours allocation formula. However, none have comprehensive, detailed workload allocation models or workload allocation models that take into account the range of tasks which e-teaching requires. This study also found that "[work] overload due to e-teaching was a significant factor in staff dissatisfaction" (p.2). Secondly, there are wide variations in what is included in the category of elearning workload for lecturers. Some studies included generic technical support of students and other (generally) non-academic functions (e.g. Cavanaugh, 2005). Another variable to consider is whether course design per se should be included as part of the lecturer workload. Spector (2005) leaves it out of workload considerations, but Nichols(2008) notes that creating an online course (or one for hybrid learning) takes significantly more time than designing one for on-campus delivery. Thirdly, there are a wide range of other factors contributing to workload such as lecturer variables (e.g. high or low level of experience with elearning). Other variables include course type and design variables (e.g. blended learning or fully online, type and intensity of learning activities), and infrastructure variables (e.g. availability of instructional design and technical support). The pedagogy espoused by the lecturer (e.g. transmissive cf. constructivist) also influences workload. There is also the variable of class sizes - boutique post-graduate classes are very different from larger undergraduate classes. O'Hare (2011) reports of an Australian University course with a typical staff:student ratio of 1:75, being taught by part-time online tutors at 12 paid hours per week, i.e. approximately 9 and a half minutes per student per week.

Some of the available literature is, in some instances, 'singular case' experience of an individual lecturer – autobiographically-based on the experience of the paper's author teaching a single course (e.g. Cavanaugh, 2005). Other instances are case studies involving small numbers of staff (e.g. Donaghy and McGee, 2003). More recent studies (e.g. Conceição and Lehman, 2011, and Tynan et al., 2012) are now emerging which report on interviews with larger numbers of lecturers (38 and 88 respectively). These studies are beginning to provide some breadth to complement the depth of previous studies.

In general, the literature that indicates the online workload is less than teaching face-to-face (FTF) classes (e.g. DiBiase, 2000) is the exception. A number of writers conclude workload is about the same as teaching face-to-face classes (e.g. Thompson 2004, Anderson and Avery 2008). A recent study by Van de Vord and Pogue (2012) indicates slightly more time per student for FTF classes, but more time is spent online evaluating student work. Most other studies maintain that the workload is considerably more than teaching face-to-face classes (e.g. Cavanaugh 2003, Shaw and Young 2003). Visser (2000) and Tynan et al. (2012) concluded that more time is needed to teach online than in a purely face-to-face setting.

To sum up, because of the relative scarcity and variability of the literature, only tentative conclusions can be drawn. However, the current literature tends to support the hypothesis that elearning lecturer workload is at least the same as teaching face-to-face, but more likely to be greater than similar face-to-face teaching.

eLearning lecturer workload management strategies

Given that the addition of an elearning component to a lecturer's workload maintains or usually increases that workload, the interest of this research is in the strategies that lecturers who are experienced with elearning employ to manage that component of their workload.

Nichols (2008) addresses this topic in a section of his e-Primer series written as a handbook for lecturers new to elearning. Included in the handbook is a study by Ragan and Terheggan (2003), which outlined a more detailed set of strategies based on an e-teaching professional development course for lecturers at Penn State University. An example of a more recently published, comprehensive study examining workload is that of four Australian Universities contained in the Out of Hours project report (Tynan et al., 2012). Conceição and Lehman, (2011) provide, in their recent book, an example of a research-based approach to online workload management a using survey of 38 participants with 14 follow-up interviews. Some elearning workload management literature addresses this theme in an anecdotal way, usually based on the personal experience of the authors – the 'tips and tricks' approach (e.g. Paloff and Pratt, 2001, Boettcher and Conrad, 2010).

However, further research to explore elearning workload strategies is justified for several reasons. Firstly, research may uncover new workload management strategies as well as confirm the usefulness of existing strategies from the contemporary experience of practitioners. Secondly, publication of the research can help to disseminate these workload strategies to provide pragmatic assistance for new and experienced electurers.

Research questions, design and progress

The purpose of this research is to investigate the question of workload management for lecturers who are engaged in online teaching. Specifically the hypothesis is that lecturers who are experienced with online teaching will have developed a range of strategies for managing this component of their workload. The research question is: What are the effective work practices of experienced e-learning teachers which enable them to manage the workload of online programmes by working smarter not harder?

Case Study methodology

This research uses a case study methodology. Yin(2003) defines a case study as an empirical enquiry which researches a contemporary phenomenon within its real life context, particularly when the boundaries between phenomenon and context are not clearly evident. A limitation of the research is that selection of the lecturers was purposive and from a single institution, using the criteria that "cases are hand-picked for a specific reason" (Lewin, 2005:219). The case is of volunteer lecturers experienced with online learning from a New Zealand university, participating in a semi-structured interview. Workload strategies identified in the interviews are compared with the strategy framework outlined by Ragan and Terheggen(2003).

Job descriptions and workload allocation models

In terms of formal job descriptions, none of the lecturers interviewed so far have any clauses indicating that eteaching is part of the lecturers' workload. As all had been employed at the university five years or more (some over 20 years) this is not surprising. Most new academic job descriptions as advertised since 2011 do have a standard statement covering this component. Only one faculty (out of seven) has a workload allocation model which takes into account workload hours allocations for different elements of the job. This workload allocation model included a higher weighting to acknowledge that elearning involved an increased workload.

Workload comparisons

Interviews completed so far have confirmed the tentative conclusions of the current literature in terms of elearning lecturer workload. That is, the perception of all but one of the lecturers is that either equivalent time or more time is invested in elearning than learning delivered by face-to-face teaching. Some lecturers report the workload as being similar, but 'chunked' differently – online workload being experienced in smaller, more frequent time slots than face-to-face teaching commitments. One lecturer commented that it was easier to teach fully online than a mixture of online and face-to-face classes. Another lecturer commented that the major time investment was in setting up the course, but after that the time spent facilitating was reduced cf. face-to-face classes.

Workload management strategies

There is also some consistency with several of the workload management strategies outlined by Ragan and Terheggan (2003); such as establishing a predictable routine for course interaction, and using an LMS (Learning Management System) to focus communication and interaction. Interestingly, several lecturers had a policy of refusing to answer student email, all course-related communication and interaction had to be via the communication tools available within the LMS. This was identified as a conscious workload management strategy to circumvent email overload, a problem noted in some of the earlier workload studies. However, lecturers also identified specific extra work created by using the LMS, for example the time required to upload individual assignment feedback files for large classes.

Several lecturers had a strategy of deliberately not interacting with students in courses outside of normal working hours. While they might 'lurk' or view discussions or other online activity in evenings or weekends, they resisted posting in order to prevent any student expectation that they were the '24/7 lecturer'. Other lecturers specified response times as part of the course orientation – they would respond within a certain time frame to postings, but not during weekends, for example. Regular attention to what's happening on the online course is identified by several as a key workload management strategy – 'little and often' being recommended as better than less frequent, longer time allocations. Interestingly, Ragan and Terheggan (2003) imply the importance of time management strategies as part of their workload strategy framework but do not explicitly list any specific time management strategies per se.

Another key component to managing workload for several lecturers was advance preparation of online courses, learning activities and resources. While 'just in time' alterations were sometimes necessary, teaching workload was considered to be much more easily managed if the course was completely or substantially ready before the course was opened for student interaction. One lecturer identified the importance of trying to "see the course as the student sees it" so students weren't confused, anxious and unclear about what they were meant to be doing. He concluded that for him, this was "managing my workload by good course design".

Coaching and mentoring

The most important way that lecturers reported they had learnt these workload management strategies was from being mentored by a more experienced colleague and/or co-teaching an online course with a more experienced colleague. One lecturer gained insight into workload management from detailed recording of her online activity and reflecting on time spent on different tasks. Others reported working out strategies by trial and error for themselves. Attending professional development workshops and courses was mentioned by two as beneficial.

Innovative management strategies

Some practices outside of the scope of the strategies outlined Ragan and Terheggan (2003) have also emerged from the interviews. These include simple but effective 'do not disturb – I am teaching' signs on office doors while working online; time blocked out in online staff calendars for this purpose; and phones diverted to voicemail to enable complete focus on the e-teaching task. Some lecturers informed new online students of 'phone-in' times when they are available for phone help or advice, allocating a short, specified time during normal working hours. Lecturers also reported workload strategies which involved encouraging students to help students –for example having a discussion forum 'Questions for Anyone' where students answer each other's queries. Another strategy reported was the '3 b4 me' protocol – that lecturers would wait for at least three responses or concurrent queries before replying, to see if students could problem-solve the issue for themselves without lecturer intervention. One lecturer notified students of different lecturer response strategies specific to different discussion forums; responding regularly to most postings; providing a summative summary only; appointing a student moderator who facilitated and summarised postings. Another lecturer used podcast audio feedback for students as an efficient and personal way of providing feedback on assessments.

Summary and conclusions

The workload management strategies discussed during interviews so far represent tactics employed by experienced eteachers to manage their workload – but not always within the conventional working hours of the five-day week. Most lecturers acknowledged the overflow of work into 'out of hours' time was probably inevitable. However, they noted this typically involves other aspects of the teaching job as well as elearning (for example, marking assignments and exams). The pressure of elearning workload forcing lecturers into the role of the '24/7 professor' remains problematic, but not insoluble. Other strategies may emerge from further interviews, and more thematic analysis of the interview discussions is currently on-going. However, it must be remembered that at least part of the future and sustainability of elearning depends on lecturers managing their elearning workload effectively so that they don't 'burn out' from workload demands.

An online community designed to support future makers in educational reform

Tania Broadley
Curtin Business School
Curtin University

Sue Ledger
School of Education
Murdoch University

Australian education is undergoing national reform at many levels. The school sector, where pre-service teachers will be employed, are adjusting to the demands of the National Curriculum and improving teacher quality through the National Professional Standards for Teachers. In addition, the university sector, where pre-service teachers are prepared, is undergoing its own education reform through the introduction of a demand-driven system and ensuring quality for tertiary education interns through the Higher Education Standards Framework. In moving to prepare pre-service teachers for the school system; universities are grappling with the double-barreled approach to teacher quality; quality within the university course and quality within the student teachers being prepared. Through a collaborative partnership including university lecturers, Department of Education central administration staff, school principals, school coordinators, practicum supervisors, mentor teachers and pre-service teachers; the stakeholders have formed an online community of learners engaging in reflective practice who are committed to improving teacher quality. This online community not only links the key stakeholders within the project, it facilitates the nexus between theory and practice often missing in our pre-service teacher placements. This paper reports preliminary data about an initiative to ensure final year pre-service teachers are aspiring to meet the graduate professional standards through the use of an innovative online community.

Keywords: online learning, national teacher professional standards, pre-service teachers

Introduction

There is increasing focus on teacher quality and standards within Australian education practices, including the school and university sector. At the university level, the Tertiary Education Quality and Standards Agency (TEQSA) is Australia's quality agency for higher education. Its primary aim is to "ensure that interns receive a high quality education at any Australian higher education provider" (Commonwealth of Australia, 2011).

In terms of schools, the Australian Institute of Teaching and School Leadership (AITSL) is charged with providing national leadership on the promotion of excellence in the professional practice of teaching and school leadership. The National Professional Standards for Teachers explicitly state what teachers know and should be able to do at four career stages including: Graduate, Proficient, Highly Accomplished and Lead (Education Services Australia, 2011). The purpose of the standards are:

> To contribute to the professionalisation of teaching and raise the status of the profession. They could also be used as the basis for a professional accountability model, helping to ensure that teachers can demonstrate appropriate levels of professional knowledge, professional practice and professional engagement (MCEETYA, 2003, p. 11).

In order to ensure pre-service teachers are entering the workforce with the skills, knowledge and attributes of a Graduate Teacher, current teacher education programs offered by universities must explicitly connect with these standards.

Background

The National Professional Standards for Teachers describe what is required of teachers at four levels - Graduate, Proficient, Highly Accomplished and Lead - and support the collective responsibility of the profession to ensure that those who teach possess or will develop crucial knowledge and skills at differing stages of their career. The standards articulate what is required of teachers at each level and in doing so, aims to support improved access to quality teaching for all Australian students. The seven standards are grouped into three main domains including: Professional Knowledge, Professional Practice and Professional Engagement. Professional knowledge includes understanding how students learn, knowing the content and how to teach it. Professional Practice includes planning and implementing teaching, creating safe environments and assessing understanding and providing feedback on student learning. Professional Engagement includes engaging in professional learning throughout each level and engaging professionally with colleagues, parents and the wider education community (Australian Government, 2012).

To support education reform, the Federal government has invested significant funding into the National Partnership for Improving Teacher Quality. This program targets critical points in the teacher 'lifecycle' to attract, train, place, develop and retain quality teachers and leaders in our schools and classrooms (Australian Government, 2011).

In June 2011, the Department of Education in Western Australia called for tenders to address a National Partnership for Improving Teacher Quality: Training Schools Project.

The combined universities training schools project, more regularly known as WACUTS, includes three universities in Western Australia. A conceptual framework of the project is depicted in Figure 1. The project prides itself on a strong professional learning model where induction, formalized mentor training, CMS certification and rural field experience for interns and ongoing portal reflections are key to the quality of the project.

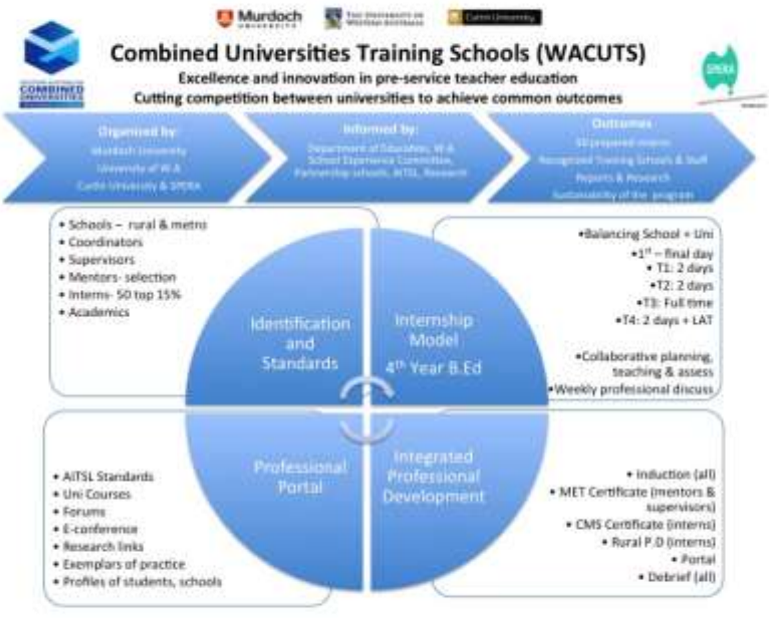

Figure 1: Conceptual Framework of WACUTS project.

Increasingly, the literature refers to the notion of a professional learning community within an e-learning environment, where teachers have convenient access to ongoing support, collaborative learning, and meaningful and stimulating discussion (Davies, Ramsay, Lindfield & Couperthwaite, 2005; Henderson, 2006; Herrington & Herrington, 2001; Rablin, 2007). A professional learning community, whether face-to-face or online, is an effective form of professional learning as the focus is on the teachers as members of a wider community of learners (Lloyd and Cochrane, 2005). The ethos of a professional learning community in the education arena is built around the continuous study of teaching and learning. Teachers who engage in these learning communities are working together to expand their teaching repertoire.

The professional portal, developed using Coursesites, is an imperative platform to enhance the online learning community that has evolved between all stakeholders within this project. This paper will report on the engagement occurring within the portal environment that is changing the discourse of pre-service teachers in a time of educational reform.

Research Context

The WACUTS project is based on an innovative internship program where 50 high achieving (top 15% of cohort) final year Bachelor of Education and Master of Teaching students were selected from within the teacher education programs at the three universities. The interns (n=50) were then placed in training schools, where 50 specifically selected mentor teachers were identified between the three universities and school leaders. Each training school appointed a school coordinator who facilitated the project within the school environment and was considered the conduit between the school and university staff.

The first year of the project started in January 2012. In this inaugural year there were 31 interns placed in metropolitan schools in the Perth area and 19 interns placed in regional schools outside of the Perth area. This project has three university academics from three different universities working closely with a project manager who is also a member of the Society for the Provision of Education in Rural Australia (SPERA). This link has ensured that the complexity of placing pre-service teachers in regional schools was considered in great detail. The importance of travel, accommodation and support for these interns was entirely different to the cohort of interns working in the metropolitan area.

Methodology

An open source Learning Management System (LMS) known as Coursesites, referred to as the portal within this project, was selected to host the online community to be engaged in the project. This system is powered by the latest technology from Blackboard 9.1 and was selected for the suite of collaborative tools available, to ensure synchronous and asynchronous communications were possible. All project participants were emailed an invitation to the portal and self-registration was required at that point.

Data were extracted from the course statistics within the portal to ascertain user statistics, number of discussion board posts and number of blog posts. Further qualitative analysis of this data will be presented in future research as the project progresses.

Results

At the time of this paper, some six months into the inaugural WACUTS project, there were 109 valid users within the portal. The total (n=112) included one test user established by the portal manager, one Blackboard administrator user and one valid user that had registered with two different email addresses, causing one of his logins to be considered invalid. Table 1 depicts the number of users enrolled in the portal and their role in the WACUTS project.

Table 1: Portal users by title and role.

Title	Brief Role Description	Users
Intern	Final year Bachelor of Ed. or Master of Teach student who is placed in one school for final year of studies.	50
Mentor	Classroom teacher who mentors and establishes a co-teaching relationship with intern.	27
School Co-coordinator	Facilitates and co-ordinates the project within the school.	15
Principal	School leader.	10
University Co-coordinator	University placement officer; school experience or practicum coordinator.	2
Project Team	Three academics from three universities; one project manager.	4
Department of Education representative	Training School Project Team employed within the Department of Education central office.	1
TOTAL		109

Reflective practice, blogging and professional standards

This section will provide a context to the reflective blogs and the number of blogs posted to each professional standard within Term 1 and 2, 2012.

Intern reflections are an integral part of the project. Reflections should demonstrate the interns' capacity to think critically about learning and teaching, together with discussion of the interns' growth as a teacher. Interns produce reflective prose, however, are encouraged to attach documents, images etc. as necessary for evidence of working toward the standards.

Each school term, interns are required to post at least one blog within the portal to address the seven National Professional Standards. Throughout the year of internship, this should culminate in a professional learning log or eportfolio of blogs that cover the seven standards. In this first instance of posting reflections, interns were scaffold through a number of direct questions that linked the standard to their university course requirements.

In Term 2, the interns were provided with less structure and asked to reflect on their Term 1 blog entry and provide a connection between the standard, their first blog, one university unit/course and specific classroom/school examples.

Over the two terms, inclusive of 21 teaching weeks, a total of 341 reflective blogs were posted to the portal. These blogs addressed the seven standards.

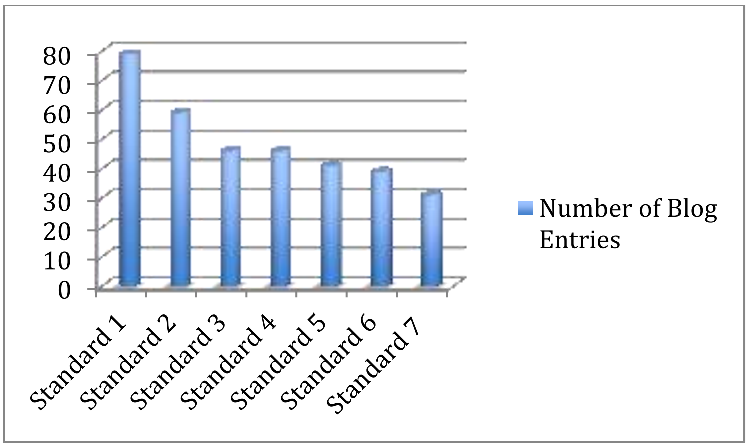

Figure 2: Number of reflective blogs for each Professional Standard in Term 1 & 2.

As reported in Figure 2, 79 blogs were posted to *Standard 1: Know interns and how they learn*; 59 blogs were posted to *Standard 2: Know the content and how to teach it*; 46 blogs posted to *Standard 3: Plan for and implement effective teaching and learning*; 46 blogs posted to *Standard 4: Create and maintain supportive and safe learning environments*; 41 blogs were posted to *Standard 5: Assess, provide feedback and report on student learning*; 39 blogs were posted to *Standard 6: Engage in professional learning* and 31 blogs were posted to *Standard 7: Engage professionally with colleagues, carers and the community.*

Strategies for online community building

This section will outline the five additional aspects of the portal that demonstrate the rich community that is being developed within the WACUTS portal. The portal is used to connect all participants in the project at all levels and is the main forum for dissemination of information; to ensure consistency in communication is received by all interns, mentors, school based co-ordinators, university co-ordinators and principals. More importantly, the portal has provided a platform for a community of practice around the combined universities training schools project.

1. The *Announcements* tool is highly utilised by the project team in order to provide important information regarding professional development sessions, university commitments, professional standard blog reminders and general communications.
2. Outside of the *Intern Reflection* blogs and the *Announcements* tool, the most utilised section of the portal are the *Coffee Lounges.* These informal discussion boards are split into the different user roles as mentioned in Table 1, however interns have a personal discussion thread, and all other users have a shared discussion thread. At the time of writing this paper, there were 114 posts in the Intern lounge and 23 posts in the 'other' users lounge.
3. The portal section, *In The News*, has developed a sense of wider community engagement through newspaper articles, school newsletters, community radio shows and digital videos that have showcased the interns, mentors and schools within the project. In the first six months, there were four artefacts loaded into the portal.
4. The course menu entitled *Partnership Schools*, provides the specific school logo and a web link to each school that is engaged within the WACUTS project. Users are able to connect quickly to other schools within the project and view the website of that school.
5. As timely topics for discussion arise, the section *Education Topics for Discussion,* is used to host youtube videos, journal articles, news links and websites. Of importance are the professional dialogue that arises from viewing such material. In order to encourage this dialogue to occur, a discussion board forum is attached to each topic of interest.

Discussion

The number of users enrolled in the portal closely reflected the number of people participating in the project. One challenge faced by the project team, was the issue of timely self-registration by participants. Due to the self-registration process the full number of enrolments was not achieved from the first email invitations, this meant further portal invitations including reminders were required throughout Term 1. In fact, there is evidence to show that some school-based staff had still not registered. This causes some concern in terms of ensuring regular updates of professional development and communications are being delivered to all school-based staff. Further, due to the total number of mentor teachers enrolled, it would appear they are the group least represented from their total numbers i.e 27/50.

The collections of intern blogs are paramount to documenting the success of interns moving toward the Graduate level of the professional standards. The blog tool within the portal appears to be the most appropriate tool to support the ongoing reflections of interns over one full year. Currently, university staff provide feedback to interns regarding the content of the blogs. This raises the notion of collegiate responses from others in the project and the possibility of mentor teachers or school based co-ordinators contributing to such valuable professional discourse. Consideration would need to be given to the impact on the demands already placed on teachers and workload issues associated. Currently, there are some cases of interns providing peer review of intern blogs and this could be further encouraged and developed in Term 3 and 4.

It is noticeable within the chart depicting number of blogs posted that a decline in posts has occurred since Standard 1. This could be due to many interns preparing and undertaking university exams during Term 2, which appears to have impacted on the number of interns posting their reflective blogs. Although there is a relative degree of flexibility in the due date of reflections, the due dates for Standards 5, 6 and 7 had not fallen at the time of writing this paper. These two reasons could provide a better understanding of the gradual decline in blog posts evident in the graphical representation.

The five initiatives within the portal to develop the online community have proven to be highly successful to this point. It is clear from the *Coffee Lounges* that interns use informal connections more than mentors. Anecdotally, a small number of mentor teachers within the program have been attempting to drive a more networked collegiate approach to mentoring, however have been less than successful to this point. In the future, the use of synchronous technologies, such as the virtual classroom, will aim to provide a better connection point for mentor teachers.

Conclusion

In a time of education reform where the National Professional Standards for Teachers (Australian Government, 2012) are driving the school experience and pre-service teacher university programs; this paper has delivered an innovative method of supporting pre-service teachers (known in this project as Interns) through an online community. The standards provide a statement of what constitutes teacher quality at all levels including graduates and as such can provide a keystone for the field experience model.

The very nature of the online community described in this paper, which resonates with Davies et.al. (2005), allows for collegiate networking and support across all key stakeholders including university lecturers, Department of Education central administration staff, school principals, school co-ordinators, practicum supervisors, mentor teachers and pre-service teachers.

Through the richness of the portal environment, a community of practice has evolved around the central notion of building a mentoring internship program. This online community not only links the key stakeholders within the project, it facilitates the nexus between theory and practice often missing in our pre-service teacher placements.

Living the new normal: Reflections on the experiences of first-time distance learners

Mark Brown

Mike Keppell

Helen Hughes

Natasha Hard

Sandi Shillington

Liz Smith

Significant challenges face traditional distance education. The conventional 'pack and post' model of distance education is under serious threat along with the performance of distance education providers as governments and funding bodies increasingly scrutinize retention, progression and completion rates. The objective of the current study was to contribute to the enhancement of services and resources available for first-time distance learners in the future. The study was framed around Design-based Research involving a mixed method approach over three phases. The third phase was the major component of the study, which involved gathering the lived experiences of 20 first-time distance learners, in their own words, using weekly video diaries for data collection. The research proposed seven key takeaways, alongside seven guiding principles aimed at distance education providers wanting to enhance the success of distance learners in the future.

Keywords: Distance learners, retention, student success, digital learning, video diaries

Introduction

Historically, distance education is rooted in the goals of increasing educational access and promoting lifelong learning and development. Over the 20th Century, distance education has evolved to provide opportunities for study and life-long learning for mature and second chance learners, geographically isolated people and those from minority and lower socio-economic groups, along with students with disabilities (Daniel, 2011).

More recently, anecdotal evidence from distance providers in developed countries report a shifting profile from undergraduate to postgraduate study as the population ages and mid-career professionals strive to advance their careers. There is also evidence of increasing demand from younger students for the flexibility and convenience that distance education provides through the use of digital technologies (Krause et al., 2005). Since the advent of the World-Wide Web, a dazzling array of new possibilities has emerged and a new generation of digitally mediated distance education has fundamentally changed the tertiary education landscape (McKee, 2010). Arguably, new and emerging models of online, blended and distance education have become the 'new normal' in today's socially wired and globally connected world.

In contrast to the traditional first generation correspondence model of distance education (Taylor, 1995), or the 'lone wolf' approach to distance learning, Tennant, McMullen and Kaczynski (2009) report that online learning is the fastest growing sector of tertiary education. This growth has been driven in part by conventional institutions increasingly adopting new online and blended models of distance education as a 'sunrise industry' with many having established subdivisions to develop it (Simpson, 2000, p. 1). In particular, the enterprise-wide adoption of Learning Management Systems (LMS) in the last decade has helped many institutions to expand into the foray of distance education. As Sir John Daniel (2011) observes, the digital revolution has the potential to transform the 'iron triangle' of distance education 'to achieve wider access, higher quality and lower cost all at the same time'.

Currently, around 26% of students at the tertiary level In New Zealand study by distance education (Ministry of Education, 2010). In 2010, Ministry of Education statistics show that universities account for 25% of total Equivalent Full-time Students (EFTS) studying by distance with 16% of undergraduate degrees being undertaken by distance learners. Although Australia has been a pioneer in this field, over the last decade it is estimated that 15% of university students each year have studied by distance education (Nunan, 2005).

In comparison, in the United States the latest annual survey of online learning claims the number of students taking at least one online course has surpassed six million (Allen & Seaman, 2011). Based on these figures, Allen and Seaman (2011) estimate that 31% of higher education students in the United States now take at least one course online. This claim is further evidence of what is described as 'convergence'—that is, the gradual blurring of the boundaries of the distinction between 'campus-bound' and 'distance learning' paradigms (OECD, 1996).

In the United Kingdom a recent Online Learning Task Force (2011) encourages universities to seize the opportunities that new forms of online learning provide to enhance student choice and meet learners' expectations of greater flexibility and convenience. The Task Force concludes:

> Online learning – however blended with on-or off-campus interactions, whether delivered in the UK or overseas – provides real opportunity for UK institutions to develop responsive, engaging and interactive provision which, if offered at scale, can deliver quality and cost-effectiveness and meet student demands for flexible learning. (Online Learning Task Force, 2011, p.3).

Methodology

The objective of the current study was to contribute to the enhancement of services and resources available for first-time distance learners in the future. The research adopted a mixed methodology across three phases. Phase One involved a stocktake of current institutional services and supports at two large-scale distance education providers in Australasia. The primary data collection technique was document analysis. Informal meetings with staff involved in leading the initiatives at both institutions also helped to clarify questions related to specific services and resources. Initiatives were mapped against the conceptual framework developed by MacKay, Shillington, Paewai, Brown, Suddaby and White (2010) to support different interventions across the study lifecycle.

Phase Two involved the recruitment of first-time distance learners, followed by a baseline survey leading up to and during Semester 2, 2011. The survey comprised two sections: a reflective section followed by a demographic section. The reflective section was structured to gather student perceptions of reasons for undertaking distance study and to explore their perceived approach to study drawing on the concept of deep, strategic and surface study orchestrations taken from the Approaches and Study Skills Inventory for Students (ASSIST) used by Anderson et al. (2011). It was also designed around the Equivalency of Interaction Theory of student interaction with other students, staff and content (Anderson, 2003).

Phase Three had a strong phenomenological dimension where the experiences of first-time distance learners at one of the universities were recorded from their own point of view using video diaries for data collection. Approval to conduct the second phase of the project was granted by lead university's Human Ethics Committee. From a population of 750 potential participants enrolled for the first time at the beginning of Semester Two, 2011, 140 first-time distance learners volunteered to participate in Phase Three. Of these volunteers, 20 students were selected to participate in the video diary phase using Sony bloggie™ cameras. The sample was purposively selected to broadly represent the demographic and geographic diversity of first-time distance learners. The profile of diversity was informed by a demographic analysis of the University's distance students during the 2010 academic year. Selection criteria included: age, gender, ethnicity, geographic location, subject of study, level of study, entry qualification, along with prior or current experience of tertiary study on-campus.

Video reflections were gathered using a diary technique adapted from previous studies. Riddle and Arnold (2007) used the 'Day Experience Method' to investigate everyday life situations. They required participants to record written answers to specific questions sent at irregular intervals (between 30 and 90 minutes) between 8am and 10pm on three separate days. In contrast, Cashmore, Green and Scott (2010) adopted a free-form approach to video diaries in a longitudinal study with undergraduate students at the University of Leicester. The present study adopted an approach that struck a balance between a structured approach and free-form approach. The initial expectation was for five minutes-worth of video footage per week; although this expectation waned given that the greater issue was not one of duration but 'forthcomingness' and 'insightfulness' of information. A 'reflective prompt' protocol was designed to encourage 'free-flow' reflections whilst providing 'fish-hooks' to elicit targeted categories of information in a lightly structured manner. Within 48 hours of receiving a participant's video file, the Project Manager would respond via email with a set of reflective prompts.

An exceptional amount of rich data was collected over the first half of the Semester. During semester-break, participants were given the opportunity to continue or conclude their involvement in the project as they had managed their way through the crucial first few weeks of study. Eight participants chose to conclude, while twelve chose to continue until the end of semester. Although continuation of the video diaries beyond the initial six weeks was not part of the original plan, the research team was mindful of any sense in which the students felt abandoned on conclusion of the study.

Consistent with the intention of drawing on the principles of a phenomenological approach, a grounded strategy was adopted to data analysis. The purpose was to ensure that the student voice was retained at the forefront of the analysis. That said, the researchers' implicit and explicit theories meant that student responses and subsequent data analysis were clearly influenced by pre-existing knowledge. To address this issue as much as possible, the Project Manager was responsible for most of the data analysis and the interpretation of findings was the subject of considerable discussion throughout the data analysis phase among the Project Team; as well as with an Advisory Group of subject matter experts.

The analytic approach was thematic analysis, which is a technique for identifying, analysing and reporting themes within data. A theme captures something important about the data in relation to the research question, and represents some level of patterned response or meaning within the data set (Braun & Clarke, 2003). In this study, thematic analysis followed a 'realist' approach in which the experiences, meanings and lived reality of participants were described as fully as possible to retain a sense of context. Within the limitations of grounded theory, an inductive approach ('bottom-up') was applied, which meant that the major themes arose from the data. Thematic analysis followed Braun and Clarke's (2003) six-step process.

Results

Grounded in the results of Phases One, Two and Three, seven key takeaways emerged from the study. These draw attention to some of the challenges ahead for distance education as it evolves to potentially become the 'new normal' mode of tertiary education delivery:

1. Learner stories add flesh to the 'soft factors' of what it means to be a distance learner. Reflections, recorded in student's own words, provide unique insight into the complexity of studying from a distance.
2. Adopting a conceptual framework that maps services and resources across different phases of the study lifecycle can help institutions to better design and coordinate supports which meet the diverse needs of distance learners.
3. Distance learning was perceived to enable tertiary study to fit around other life, work and family commitments. However, first-time distance students have relatively little conception of the actual demands of studying by distance.
4. Distance students who begin with study goals that are aligned with their wider aspirations and realistically balanced alongside life's other commitments also typically report active study orientations.
5. Although learner stories affirm the importance of the first few weeks of study, there are ebbs and flows in the life of a distance student over the semester; while a second 'at risk' period was identified in later weeks.
6. Digital literacy is variable among first-time distance learners; age and gender are not strong indicators of digital literacy. Irrespective of the level of digital literacy, insights gained from learner stories reveal that few students know how to be effective online learners.
7. Video diaries coupled with the researcher's role influenced student engagement by metaphorically providing a new cave, campfire, watering hole and mountain top for active learning and reflection (Thornberg, 1996). Learner stories highlighted the value of institutions supporting opportunities for first-time distance learners to engage in regular interaction and reflection over the initial stages of their study.

Discussion

Drawing on insights gained from first-time distance learners, alongside contemporary literature on retention, progression and completion, the guiding principles provide a basis for discussion among institutions wanting to deliver quality distance education to meet the needs of students in the future:

- Principle 1: Shared goals
  To what extent does the institution assist students to define their goals and understand whether university-level distance education is the most appropriate study option for them?
- Principle 2: Personal agency

To what extent does the institution develop the capacity (skills, understanding and opportunities) for distance learners to engage and purposively develop their own sense of belonging?

- Principle 3: Adaptive empathy
  To what extent does the institution promote a welcoming culture which seeks to understand the individual and diverse needs of distance students?
- Principle 4: Personalisation
  To what extent does learner profiling and institutional data monitoring allow for customized teaching and learning services to respond to individual needs?
- Principle 5: Transactional engagement
  To what extent do academic staff take responsibility for cultivating a sense of belonging through their curriculum design, learning activities and student interactions?
- Principle 6: Networked learning
  To what extent do online learning environments foster a sense of teacher and learner presence so distance learners feel they are part of a wider learning network?
- Principle 7: Spaces for knowledge generation
  To what extent does the institution intentionally design for reflection and knowledge generation within and across a range of distributed places and spaces?

Conclusion

In the rapidly changing landscape of higher education, the growth of new digital technologies has created significant opportunities for new institutions to enter the distance education community and is transforming the nature of distance education among existing providers. However, in this dynamic environment, it is important not to lose sight of whom the ‘new normal’ of online, blended and distance education serves. Many of the students in this research would not have been able to better themselves or develop capacity to enhance their workplace and potential to transform their local communities without the option of studying by distance. The new fusion of digital and distance continues to play a key role in providing life-long learning opportunities to a demographically, culturally and geographically diverse population at different stages of the learning pathway. In this regard, the learner stories reported in this study offer a glimpse of the benefits of supporting and enhancing different pathways to tertiary education in the future.

Sustaining new approaches to learning and teaching with technology - more than just a Wicked Problem

Janet Buchan
Division of Learning and Teaching Services
Charles Sturt University

The basic premise of the 2012 Ascilite Conference theme is that; 'what happened in the past is no longer a reliable guide to the future'. However, if we do not learn from what happened in the past, it may well be a reliable guide to an unsustainable future. In the face of constant change, in order for higher education institutions to achieve the goal of creating sustainable approaches to new models and learning and teaching with technology a fundamental paradigm shift in management approaches is required. To address this, an interdisciplinary focus is introduced and two key concepts from environmental management: Wicked Problems and adaptive management are applied to the higher education environment. Using evidence-based practice these aspects have been researched in-depth in a large, mixed-mode university.

Keywords: learning environment, educational management, change management, wicked problems, adaptive management, sustainability

Introduction

> Information technology has brought about much of the economic growth of the past century, accelerating globalization and fostering democracy. Such broad impacts would be impossible if "information technology" were only a set of technologies. As our use of mobile devices, games, and social networks illustrates, information technology can create new experiences. But more important, information technology enables new models. It can disaggregate and decouple products and processes, allowing the creation of new value propositions, value chains, and enterprises. These new models can help higher education serve new groups of students, in greater numbers, and with better learning outcomes.
> As important as information technology might be, technology does not have impact in isolation—it operates as one element in a complex adaptive system... (Oblinger 2012)

When embracing technology and new models of learning and teaching in higher education there is a degree of hesitation noted in our sector. The themes of recent professional conferences in the area of educational technology give some idea where our preoccupations lie and where our recent research focus has been:

- Ascilite 2010 Conference – 'Curriculum, technology and transformation for an uncertain future.' (Available from HUhttp://www.ascilite.org.au/conferences/sydney10/UH);
- DE HUB/ODLAA Summit 2011 – 'Education 2011-2021. Global challenges and perspectives of blended and distance learning.' (HUhttp://www.dehub.edu.au/summit2011/about.htmlUH);
- Association for Learning Technology UK, 2011 Conference – 'Thriving in a colder and more challenging climate.' (Available from HUhttp://www.alt.ac.uk/altc/alt-c-2011UH);
- Association for Learning Technology UK, 2012 Conference – 'A confrontation with reality' (Available from (HUhttp://www.alt.ac.uk/altc2012UH);
- Tertiary Education Management Conference 2011 – 'Riding the Waves.'(Available from HUhttp://www.temc.org.au/temc-2011UH).

An example of the challenges we face in higher education is given by Diana Oblinger, President and CEO of EDUCAUSE who put forward some 'Questions for the future' in an article that is the result of global collaboration on the future of higher education (Oblinger 2010).

Oblinger (2010) notes that higher education is:

> A complex and adaptive system [and] … is influenced by trends in the larger society. Although Australia, the United States, the United Kingdom, and the Netherlands differ in many ways, similar forces are driving change in higher education in all four countries…

Higher education faces numerous challenges posed by the drivers of change, including worldwide demand for education, financial constraints, and a constantly changing knowledge base. Those of us involved with information technology in higher education thus need to ask ourselves several critical questions:

- How can we accommodate the increase in numbers of students without compromising quality?
- What can we do to lower the cost of learning resources?
- How flexible is our higher education system? Does it provide paths to degree completion that suit all students?
- If we were to transform the student experience, what would it look like? What would we do differently? How would those changes affect the individual? The workplace? Society?
- Can we create a better linkage between research and instruction, creating new opportunities for discovery and community?
- What can we do to speed the translation of research into solutions that benefit society?
- What type of administrative services and support will allow the institution, faculty, and students to optimize their time and talents?
- If the college/university metaphor today is a network rather than a campus, what does that mean for our work in information technology?' (Oblinger 2010, p.52)

Those of us who have been involved in higher education for any length of time will probably be thinking, 'familiar', 'not again', 'we went through that X years ago'…These challenges equate to Wicked Problems - the types of problems for which there could be important potential application for the findings of this research.

.Approach

An interdisciplinary focus is introduced by examining two key aspects of environmental management - Wicked Problems and Adaptive Management. Evidence-based practice has been applied by drawing on documented evidence, practical experience and research conducted within the context of the author's institution over a period of nine years. These research studies have applied a variety of environmental management concepts and theory to aspects of management of the learning environment, with a particular focus on the use of educational technology in the technology-enhanced learning environment (Buchan and Buchan 2003; Buchan 2008; Buchan 2010). The breadth and depth of insight from this evidence-based research gives rigour to the findings of this exploration.

Wicked problems

> Some problems are so complex that you have to be highly intelligent and well informed just to be undecided about them. (Laurence J. Peter quoted in Conklin 2005. P.1)

An exploration into environmental management gives us the wicked problem (Buchan 2012)**.** The perspective afforded by a study of the wicked problem contributes to our understanding of the variety of challenges in our broader environment, including an understanding of organisational management.

The term was first introduced into practice in 1969, in an address by Rittel and Webber to the Panel on Policy Sciences, American Association for the Advancement of Science, Boston. It is introduced into the literature in 1973 in Rittel and Webber's definitive article, *'Dilemmas in a general theory of planning'*. It is interesting to note that this article is published in the journal *Policy Sciences*, which is appropriate since policy and planning are fundamental to all organisational, educational and environmental fields of practice (Buchan 2012 in prep).

A search for references to wicked problems reveals thousands of references. References range from personal blog references, daily news items and company reports to scientific and academic research. In the contemporary literature the wicked problem is used widely in formal research as well as informal discussion. The concept of the wicked problem has been applied to Indigenous policy, juvenile justice (Murphy 2010), healthcare systems (Periyakoil 2007), public service policy, software solutions (deGrace & Stuhl, 1990), international enforcement of unregulated fisheries (Osterbohm et al 2010, Wang 2002) and business strategy (Camillus 2008). The use of the wicked problem is widespread in environmental management (Allan 2008). In this field it is more than simply a convenient term, since it is supported by research into management solutions (Allan 2007; Fazey and Schultz 2009; Stankey and Allan 2009).

'Wicked problem' is a term originally used in social planning to describe a problem that is difficult or impossible to solve because of incomplete, contradictory and changing requirements that are often difficult to recognise. Moreover, because of complex interdependencies, the effort to solve one aspect of a wicked problem may reveal or create other problems (Conklin 2005) .

At its simplest, a wicked problem can be described as having the following defining characteristics:

- You don't understand the problem until you have developed a solution.
- Stakeholders have radically different world views and different frames for understanding the problem.
- Constraints and resources for solving the problem change over time.
- Wicked problems have no stopping rule (the problem is never solved completely).
- Every wicked problem is essentially unique and novel.
- Solutions to wicked problems are not right or wrong.
- Every solution to a wicked problem is a 'one-shot' operation. (Rittel and Webber 1973; Conklin 2005)

'If a problem involves many stakeholders with conflicting priorities; if its roots are tangled; if it changes with every attempt to address it; if you've never faced it before; and if there's no way to evaluate whether a remedy will work, chances are good that it's wicked.' (Camillus 2008 online)

Given the basic characteristics of the Wicked Problem, it aptly identifies many of the managerial situations found in higher education. There are, however, relatively few substantial references to wicked problems in the field of education and this is a new and growing area of research (Bore and Wright 2009; Krause 2010; Trowler 2010).

Every Wicked Problem is essentially unique and novel.
Case study institution scenario – The following scenario was reported on in Buchan, Rafferty and Munday (2009); *'An investigation into the enhancement of blended learning environments – towards an effective pedagogy and practice'.* The study took place between 2005 and 2009 in the form of a Scholarship in Teaching project. The ambition was; '…to improve the educational experience of tertiary education students through engaging emerging technologies … The primary aims of the study were to develop an effective pedagogy for flexible and blended learning and to examine the values and limitations of blended learning opportunities offered through technology-enhanced learning experiences.' (Rafferty, Munday et al. 2011) . This was done through the use of heuristic inquiry process in an extensive case study. If the basic features of a wicked problem are applied to this scenario, what began with a simple ambition to teach better grew into what we can now recognise as a 'Wicked Problem'.

Stakeholders have radically different world views and different frames for understanding the problem.
Some of the practical outcomes of the research were summarised in this checklist. These organisational limitations and implications were identified in the case study within a particular institutional context and originally identified from the data as *issues*. The checklist frames the issues, the questions to be asked and it gives a hint of some of the solutions.

> A checklist of organisational limitations and implications for blended and flexible learning in practice:.

- For a university to be committed to blended and flexible learning it should have a stated definition of blended learning in its own context that is shared across the institution in order to guide the development of appropriate administrative and support processes
- Distance teaching and resource based blended learning approaches require significant time investment in order to fully engage students
- The academic who writes and plans the subject may not always be the person responsible for teaching the subject
- Academic fatigue can result in staff taking the path of non-excellence.
- Where there are staffing changes and academic buy-out for marking, adequate guidelines and detailed expectations should be provided for the markers
- Staffing allocations, and formulas for such, should account for varying class sizes, and [should] factor in the time taken to design and develop subjects for blended learning
- Timetable systems may not accommodate flexible use of learning spaces (classrooms)
- Student enrolment options should support blended learning
- The blended learning experience can be enhanced by active engagement in improving the learning environment of staff and students through scholarly research.

- Investment in educational designers and learning technologists can provide useful support for academics in designing effective blended learning experiences. (Rafferty, Munday et al. 2011)

You don't understand the problem until you have developed a solution.
The aim of experimenting with the use of digital media and technology to improve student outcomes was the starting point. The research problem being addressed was the perception that digital media could be used as part of a more effective way to teach students - not exactly a problem. However, the lived experience of the study uncovered a number of organisational limitations and implications which all contributed to the identification of a *complex problem*. This involved multiple stakeholders across the regional, mixed mode university and it became evident that there were different world views in this complex institution. There were institutional inconsistencies in the definition of flexible learning and in how the practice was actually supported on the ground. The interpretation of blended and flexible learning with which the researchers began in 2005, was a personal one and not necessarily shared by the university as a whole (Buchan, Rafferty et al. 2009).

Constraints and resources for solving the problem change over time.
Fast forward to 2012. Since 2005 when the blended learning study began there have been significant advances in providing support for the use of technology and exploring alternative models for learning and teaching with technology at CSU. This support ranges from hands-on practical centralised support to a long term strategic focus through the development of an institutional Educational Technology Framework (Uys, Keppell et al. 2010)

There have been some practical institutional advances such as a new electronic timetabling system (introduced in 2012) and advances in achieving consistency in workload policies to address the different modes of teaching. At a University level there have been structural organisational changes to support and foster learning and teaching. Some of these changes are represented in Figure 1. There has also been a significant investment in initiatives associated with the Flexible Learning Institute which are reported on in an inter-institutional DE HUB project (Buchan 2012).

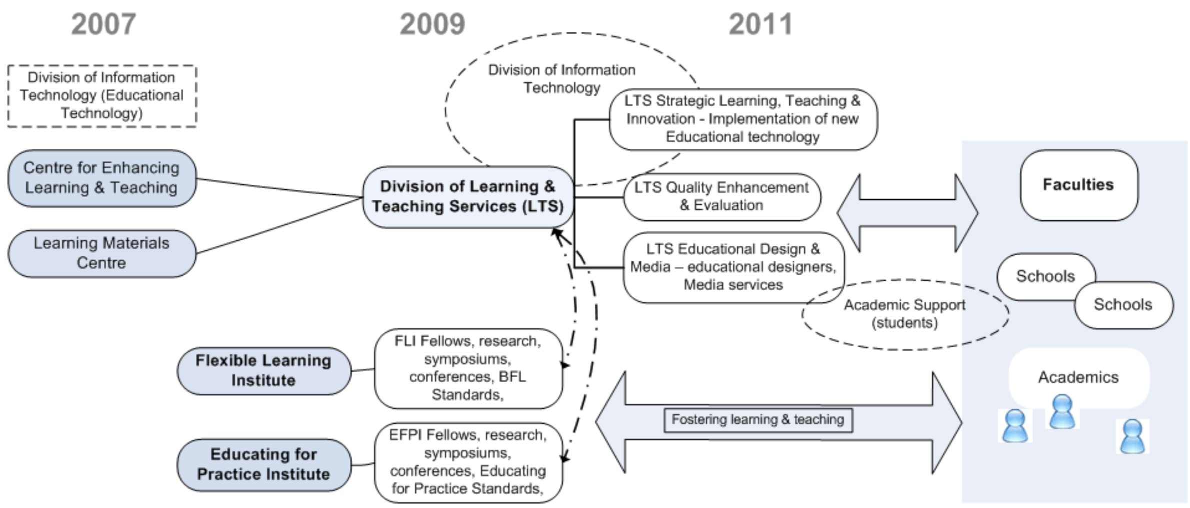

Figure 1: **The changing organisational structure of CSU: focusing on educational institutes, divisions, and units which support and foster learning and teaching (Buchan 2012)**

Wicked Problems have no stopping rule (the problem is never solved completely).
Educause Review's top Ten IT issues (Camp, DeBlois et al. 2007; Ingerman, Yang et al. 2010) are a good indication of current areas of concern in educational technology management. A Wicked Problem may never be solved completely, but only resolved again and again. This is not intended as flippant or critical, but realistically suggests that we need to consciously employ particular approaches to the management of truly wicked problems. When a wicked problem is identified there needs to be a tacit acceptance that there can be no single solution. One needs to be prepared to monitor, reassess and identify issues continually to address current progress.

Adaptive management

Adaptive management techniques are used extensively in natural resource management in an attempt to manage the uncertainty and complexity associated with natural resource management (Lee 1999; Allan and Curtis 2003; Allan 2004). The promise of adaptive management is that it has the potential to allow use of the management process as a way of understanding complex processes (Stankey and Allan 2009). The origin of adaptive management is in work done in the 1970's where scientists began looking for alternatives to existing environment assessment methods (Holling 1973).

Adaptive management combines management, research and monitoring and is a means of changing practices so that credible information is gained and management activities are modified by experience (Allan and Curtis 2003). Briefly, the adaptive management cycle begins with using indicators to benchmark and determine the current state of the environment. Planning is then done, the plans are implemented and the effects of the changes/new systems are monitored and reviewed. At each stage in the adaptive management cycle there is active reviewing of the current situation and learning from action that informs ongoing changes and improvements towards desired outcomes (Figure 2).

An important part of the process of policy and managerial decision making is adaptive management (Allan 2007). The essence of adaptive management is that it contributes to improved governance (policy and organisational processes). By using adaptive management the governance process itself is seen as 'experimental' and there is an in-principle agreement amongst contributing stakeholders to continually change things. While the term 'governance' may not sit comfortably with many academics, it is a part of our university management system and one with which we need to engage.

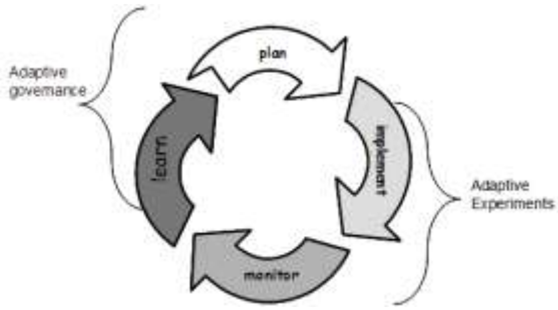

Figure 2: A simple conceptualisation of adaptive management (Allan 2007, p.2)

Adaptive management has promise in the educational management field because it ensures a focus on the *shared values* of the learning environment. It could potentially provide a way of developing dynamic policy and management decisions that can last beyond the lifecycle of a research or institutional project and could contribute to the ongoing management of the learning environment (Buchan, Rafferty et al. 2009). The promise of adaptive management also provides a way in which the evidence from academic research can inform management decisions to help a university truly become a learning organisation (Watkins and Marsicr 1993; Somekh and Thaler 1997; Dealtry 2008), thus making the most of its core business – learning.

Exploratory research into adaptive management

Since 2003 I have explored the application of adaptive management in educational management in a number of separate studies. These include exploring the use of adaptive management in: course (program) and subject management; environmental sustainability education programs; institutional project management and institutional change management for educational technology. A brief summary of the key aspects of the studies are provided here and readers are referred to the original research works for more detail.

Adaptive management was first introduced for use in educational management through a conceptual study; 'Lessons from nature: Developing an adaptive management model for sustaining quality learning environments' (Buchan and Buchan 2003). The original study drew heavily on environmental theory, metaphor and technical terminology. The outcome of that original study was the Adaptive Management Model which could be used as a framework for planning and analysis in educational environments. This original framework drew on principles of management for our natural environment to develop a values-based decision-making tool.

In 2004 the Adaptive Management Model was refined into the Adaptive Management Conceptual Framework and applied to the field of sustainability education in the paper: 'Successful Environmental Education: Adapting to the Educational Habitat'(Buchan 2004). A conclusion from that study was:

> 'Introducing adaptive management to the educational environment shifts the boundaries of the paradigm of educational management. It ensures that management of the learning environment is holistic; that the decisions made feed into actions and the effects of those actions are measured, with any necessary improvements made in the future. Most importantly, it ensures that the decision making processes controlling environmental sustainability education programs are grounded in appropriate values. Environmental sustainability education programs should be a fundamental part of our survival and it is only once something has an intrinsic value that its future is secure.' (Buchan 2004, p.54)

Adaptive management and blended learning

Between 2005 and 2008 adaptive management was incorporated into the longitudinal study; 'An investigation into the enhancement of blended learning environments – towards an effective pedagogy and practice' (Buchan, Rafferty et al. 2009; Rafferty, Munday et al. 2011). This research resulted in a refined Adaptive Management Framework (Figure 3) that is more suited to practical use in the educational environment paradigm than the more detailed original 2003 model and 2004 framework. The important focus of this Framework is the *learning* that takes place throughout all the stages. Moving through the cycle may take days, weeks, months or even years as appropriate. The timescale is essentially dictated by what and how one is measuring, what feedback one is gathering and the rapidity with which feedback is fed into each stage.

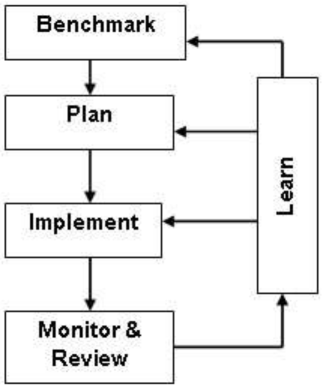

Figure 3: An Adaptive Management Framework (Buchan, Rafferty & Munday 2009, p.16)

> The Adaptive Management Framework was successfully introduced as a technique for managing the individual subjects over a number of teaching sessions (2005-2008). The researchers found the adaptive management steps; benchmark (learn), plan (learn), implement (learn), monitor and review (learn) (see Figure 2) to be a good way to focus on continuous improvement in the learning environment for the students subjects and the overall subject learning environment over time. The reflective learning process that is fundamental to successful adaptive management complemented the heuristic inquiry method used in the research. Learning from one's actions in adaptive management ideally feeds directly into policy changes that help to improve the learning environment. (Buchan, Rafferty et al. 2009)

Application of adaptive management to institutional project management 2007 to 2011

Adaptive management was explored for its possible contribution in institutional educational technology project management. This was done through one of the Online Learning Environment Programme Project teams of which I was the Project Lead. The study took place during 2007. A participatory action research model was trialled in the Project team. The key outcomes of the trial are summarised in this extract from my reflective journal.

> 'I had the feeling early on that using adaptive management in its purest sense in a project situation would not give a true reflection of adaptive management, because adaptive management is about

defining policy, taking a certain approach, and then reflecting and changing that approach according to the outcomes monitored. Projects are finite, and quite simply, the project cycle of a well run project contains the Plan-Implement-Monitor-Review cycle as part of its normal functioning…

This intuition was confirmed during the project, and I would say that the project cycle is probably closer to the action research cycle than adaptive management *per se.* This is because we were not trying anything new, and good project management requires that all team members are constantly learning from the situation as they go, and adapting accordingly…

[However] I believe that there is room for adaptive management in managing activities in the learning environment. Perhaps the critical difference between the very efficient project management approach to our operations and an adaptive management approach is perhaps that adaptive management has that longer term focus. adaptive management I would say supports the development of long term strategies, requires one to look at the big picture and not simply to focus on the current task, or at least to know where that task fits into the bigger scheme of things.' [2007 10 05 Buchan Reflection]

A more detailed understanding of the intricacies of institutional project management and the potential of projects as a means of implementing widespread (institutional) change and transformation has led to new understandings around project management for e-learning (Buchan 2010).

Using adaptive management in institutional-level change management for educational technology
Since 2010 the University's Interact2 Project has been exploring a new system to replace the LMS which underpins our existing online learning environment, *CSU Interact.* As Change Management Lead in the Interact2 Project Team, I have introduced the Adaptive Management Framework into the Interact2 Change Management Plan.

The Adaptive Management Framework is a guiding strategy for the processes and temporal aspects of the change management plan. The essence is benchmarking i.e. identifying *where we need to* be as a 'benchmark', and where the different parts of CSU (schools etc.) *actually are*. This provides a starting point for developing needs analysis tools and processes as part of the change management process. Benchmarking leads into Planning and then Implementation. Adopting an adaptive management approach ensures that we not only build continual monitoring and feedbacks into the implementation process, but importantly continue to learn along the way to inform improvements at each stage of the process. (Buchan 2012).

Further lessons from adaptive management

Stakeholders - the importance of stakeholders in the adaptive management feedback loops within the technology-enhanced learning environment was identified and some limitations in current models of using stakeholders were highlighted. A common link between environmental management and organisational management is that of shared resources and interests and thus a focus on the differing needs of stakeholders. The OLE Programme brought academics and professional (general) staff together in teams of multiple stakeholders. This foreshadowed changes to organisational structure and policy to support educational technology and we saw 'unprecedented inter-divisional and faculty cooperation' (Buchan 2010. P.71).

Organisational learning - single and double loop learning as principles of organisational learning were explored in relation to adaptive management. These principles are pre-cursors to complex systems thinking, and were explored for their potential in developing resilience at a whole-of institution level (Buchan 2012 in prep). Single loop learning within prescribed processes makes existing processes more efficient. Double loop learning means knowledge generated from single loop learning is internalised in the organisation (Argyris and Schon 1978). Double loop learning effectively supports the concepts of the learning feedback loops in the Adaptive Management Framework (Figure 3 above) where, at all stages of the adaptive management process, there is the opportunity for learning within the organisation.

Governance and policy - towards a dynamic approach – There were observed limitations in university policy development and governance in support of new models of learning and teaching. I was advised that an 'organic' approach to policy development was appropriate: 'Don't write policy in advance, once people begin using *Interact* the Learning and Teaching Committee and Senate can respond to required changes.' Taking the 'organic' approach, however, can leave the university in a precarious position where one may have been introducing new models of learning and teaching and new educational technology without the support of appropriate policy and guidelines (Buchan and Swann 2007; Buchan, Rafferty et al. 2009). Another observed limitation was that the changes in governance and policy can be independent of other initiatives. Policy changes thus end up being reactive and not proactive or anticipatory.

A final perceived limitation in policy development is inadequate feedback processes. In the absence of true lines of feedback such as those afforded by the adaptive management approach, on-ground experience and needs do not necessarily translate to changes to policy, governance and practice.

Conclusion

This paper only touches the surface of what is needed in order to effect a paradigm shift. That shift is to acknowledge a changing goal: that in our higher education environment there can be no single, stable state and change will be a constant.

I have taken some licence in drawing on the aspirational potential of adaptive management, as seen within the original context of environmental management in Allan and Stankey's 'Synthesis of lessons' (2009. p.346)

> Think then, what could be achieved in [educational management] by adaptive people, working together in trusting relationships, and within supportive organisations and institutions. When these types of processes become the norm and the standard – rather than the exception or the noteworthy – we will have made significant process *(sic)* to the goal of sustainable [environmental management of our technology-enhanced learning environment].

'We need courageous management if Adaptive Management is to work.' (Allan 2007). The reality of adaptive management in practice is that it does not always work (Smith 2009; Stankey and Allan 2009). However, one can sometimes learn as much from what did not work, as from what did. While there are limitations to applying adaptive management at an institutional level, some principles and concepts can contribute towards the development of strategies for managing a changing learning environment. The application of adaptive management in its broadest sense requires decision makers to: be prepared to come together for a common cause; be open to change and experimentation in governance and policy; plan with the intention to learn; learn from their actions; make use of multiple points of learning throughout the management process; use evidence-based practice to make their decisions and to be aware there can be no single optimum solution to a problem.

It will also be a courageous management which takes the essential step towards acknowledging that the many challenges we face in higher education are *simply* wicked problems. The wicked problem confronting us is that of creating sustainable approaches to new models of learning and teaching with technology *while managing for a changing environment*. Our management approaches need to reflect that there are no silver bullet solutions (for today's Wicked Problems the solution may need a scattergun or shotgun).

To return to the basic premise of the 2012 Ascilite Conference theme that; 'what happened in the past is no longer a reliable guide to the future'. If we do not learn from what happened in the past, it may well be a reliable guide to an unsustainable future. This is evidenced in this research which has proposed some ways forward as to how we can learn from the *past and the present* to inform a more sustainable future.

Moreover, real change will come through understanding the complex system which is the learning environment. This is the area being documented through the application of a social-ecological systems' approach to managing change through doctoral research into 'Developing resilience and managing change in technology-enhanced learning environments' (Buchan 2012).

The Sapphire Vortex: blending virtual world machinima with real world commentary for effective learning of criminal law

Professor Des Butler
Faculty of Law
Queensland University of Technology

Anne Matthew
Faculty of Law
Queensland University of Technology

Traditional approaches to teaching criminal law in Australian law schools include lectures that focus on the transmission of abstracted and decontextualised knowledge, with content often prioritised at the expense of depth. This paper discusses *The Sapphire Vortex*, a blended learning environment that combines a suite of on-line modules using *Second Life* machinima to depict a narrative involving a series of criminal offences and the ensuing courtroom proceedings, expert commentary by practising lawyers and class discussions.

Keywords: blended learning, machinima, Second Life, criminal law, expert commentary

Teaching criminal law in Australian Law Schools

Writing in 1883, AV Dicey declared that nothing 'can be taught to students of greater value, either intellectually or for the purposes of legal practice, than the habit of looking upon the law as a series of rules' (Dicey, 1883). This attitude is manifest in the traditional approach to legal education. Like many disciplines, pedagogical practices in law tend to be dominated by the transmission of abstracted and decontextualised knowledge, with content often prioritised at the expense of depth. Several forces, both at an institutional and academic level, are at work in maintaining this as the status quo.

In 1992 the Consultative Committee of State and Territorial Admitting Authorities, headed by Justice Priestley of the Supreme Court of New South Wales, compiled a list of compulsory subject areas for academic legal study which individuals must complete in order to be admitted to legal practice. This list, which is known as 'the Priestley 11', comprises 'substantive law' areas such as criminal law. It does not directly affect law curricula. However, Australian law schools typically structure their degrees to accommodate the list so that their graduates may qualify for entry into legal practice. This is most easily discharged by means of the traditional model including content-focused lectures. A further impediment against change at an institutional level is the relatively low government funding for Australian law schools, which has been recognised as a significant impediment to innovation in the development of curricula and resources (Law Council of Australia, 2008). The lack of resources may make lectures a seemingly efficient means of educating the increasingly large classes in today's law schools.

There may be several impediments to changing the status quo operating at the level of individual academics. First and foremost may be that they know no better. It has been observed that: '[M]ost teachers uncritically replicate the learning experiences that they had when students, which usually means that the dominant mode of instruction is reading lecture notes to large classes in which students are largely passive' (Keyes & Johnstone, 2004, p. 539). In other words, 'if it was good enough for me, it is good enough for them'. In addition, for many law academics another barrier is lack of technical knowledge and literacy, and/or commitment to learn new technology. There may also be a perceived threat to academic freedom and autonomy and general 'academic inertia' (Middleton & Mather, 2008).

However, law schools like other areas in higher education, now operate in a time when there is a climate for change. Significant impetus for change has been provided by seminal reports criticising the traditional approach, both for its emphasis on the transmission of knowledge about legal rules and doctrine and the manner in which the law is taught (see, eg, Pearce, Campbell & Harding, 1987). The traditional approach also does not meet the expectations or needs of modern students. The current generation of learners are surrounded by ubiquitous information and merged technology, and deal with blurred boundaries between their work, study and social lives (Nelson, Kift & Harper, 2005). They generally want the flexibility of accessing their study materials in their own time and in their own way (McGarr, 2009), to allow them to juggle the demands of competing time commitments (Moreau & Leathwood, 2006).

The Sapphire Vortex: contextualising criminal law

At the Queensland University of Technology Faculty of Law criminal law is taught by way of two second year subjects, *Fundamentals of Criminal Law* (which covers criminal offences and issues such as jury selection and bail) and *Criminal*

Responsibility (which covers defences and issues such as parties to offences and attempts). Until 2012 the subjects were taught by traditional methods, involving a weekly two hour lecture and weekly one hour tutorials. These tutorials were dominated by advocacy exercises in which students presented submissions on a detailed scenario to the tutor sitting as judge. Accordingly, apart from the two students involved in any particular exercise, students in the two subjects occupied a mostly passive role in the teaching and learning approach. This was not well regarded by many students, who indicated by way of feedback that they preferred more opportunities to practise problem solving and applying the abstract and decontextualised principles they learnt in lectures.

From 2013 the two subjects will adopt a blended learning environment that will include an on-line computer program called *The Sapphire Vortex*. This program will be a suite of fourteen on-line modules, accessed via the university's Blackboard Learning Management System. All fourteen modules utilise *machinima* – computer graphics imagery created with the use the *Second Life* virtual environment rather than costly professional software or professional programming. The central element of the program, which is featured in the first module, is a 15 minute machinima video that depicts a succession of events that take place one night at a night club, the Sapphire Club. These events commence with a rape and progress to include a glassing, a homicide, a stabbing, and drug and property offences, in a connected narrative (see Figure 1). It also portrays facts that raise issues such as self defence, provocation, diminished responsibility and intoxication. In this way the narrative covers every topic covered by the two criminal law subjects.

Figure 1: scenes from the main video

This main video is complemented in the first module by machinima video depicting ensuing courtroom proceedings including an arraignment in which the charges against the three main protagonists are read in court and jury selection.

The remaining thirteen modules follow a similar format, incorporating prescribed readings, self-test multiple choice questions and machinima videos which depict barristers making submissions in court on various points of law relating to the various offences, defences and other aspects of law studied in the two units (see Figure 2). These videos will facilitate class discussion of the law, with students preparing the judge's rulings on the barristers' submissions.

Figure 2: courtroom scenes

Throughout the modules the machinima videos are accompanied by videos of a real life crown prosecutor and defence barrister who provide expert commentary on the events at the night club and the ensuing court proceedings, including trial techniques and tactics.

Machinima-facilitated narrative enhancing learning in context

Knowledge acquired in the absence of context – the frequent product of lectures as part of a traditional approach to legal education – typically remains 'inert knowledge' that is memorised by students for exams but quickly forgotten thereafter, rather than being retrieved and used across contexts (Hasselbring, 2001). By contrast, when a learning and teaching approach involves students in addressing multiple real world problems, the transfer of new knowledge and skills can be enhanced (Spiro, 1991). It has been recognised that representations of real world situations in digital media such as video can form the basis for focused discussion (Colasante, 2011). Video used as part of a learning environment that enables discussion promotes active learner engagement.

At the same time many disciplines recognise the value of storytelling in education (Clark & Rossiter, 2008). Stories can draw audiences into their plots and settings, creating perceptual, emotional, and motivational opportunities for learning (Rowe, McQuiggan & Lester, 2007). Storytelling can not only convey important information, it can provide 'contextual cues that facilitate recall of that information in situations in which it is likely to be applicable' (Ferguson, Bareiss, Birnbaum & Osgood, 1992, p. 99). A narrative may help learners to 'create meaning, reduce cognitive load involved in navigating through information, and support cognitive and imaginative engagement' (Paulus, Horvitz & Shi, 2006, p. 356). An appropriate story can help students to process new information by relating the material being studied to concepts and situations with which they are already familiar (Ferguson et al, 1992).

The use of narrative as a means of learning is not new in legal education. From Shakespeare's *A Merchant of Venice,* Dickens' *Bleak House* and Harper Lee's *To Kill a Mockingbird* to today's John Grisham books and the films based on them and the several *Law and Order* franchises, literature and film abound with examples of stories that can serve, and have served, as useful touchstones or exemplars for the examination of legal doctrine. None, however, can be said to be deliberately created for the purpose of facilitating the discussion of particular points of law.

The traditional approach to teaching and learning law frequently sees lectures supported by tutorials in which students are required to answer esoteric theory questions or provide advice to artificial John/Jane Doe problems (Webb, 1996). While the latter generally involve short fact scenarios custom created to allow discussion of the relevant legal principles, they are normally disconnected from each other and lacking in the detail.

Machinima like that used in *The Sapphire Vortex*, on the other hand, involves 'real world filmmaking techniques being applied within an interactive virtual space where characters and events can be either controlled by humans, scripts or artificial intelligence' (Academy of Machinima Arts and Sciences, 2005). Machinima involves the real-time rendering of an interactive environment in which the creator has a creative flexibility and total control over visual representations of characters, events and settings (AMAS, 2005). The *Second Life* virtual environment, with its ability to customise avatars, artefacts and environments, and to script the movement of avatars, facial expressions and objects, provides a rich canvas for customised storytelling and the simulation of realistic situations (Butler, 2012). These virtual characters and settings can be utilised to present tasks and critical information and thereby create an authentic learning environments online (Agostinho, 2006). The machinima in *The Sapphire Vortex* is used to create a dynamic, richly detailed narrative that provides a real world context and makes overt the connections between multiple topics spanning the two criminal law subjects, thereby creating an active, engaging and challenging learning environment.

Real world commentary lending an authoritative voice

The Sapphire Vortex utilises elements of a cognitive apprenticeship approach to learning – a translation of the situated learning framework of traditional apprenticeships with features including modelling, coaching, scaffolding and exploration – to teaching with practical classroom applications (see, eg, Brown, Collins & Duguid, 1989; Collins, 1991). Application of that approach to computer-based learning has had its critics, who have seen it as a further step removed from the traditional apprenticeship model or, as Hummel (1993, p. 15) once described it 'courseware becomes the learning environment and not the authentic situation'. Tripp (1993, p. 75) expressed a similar sentiment by observing that 'true expertise is learned by being exposed to experts'.

However, it is now widely accepted that computer programs can provide an effective alternative to the real-life setting without sacrificing the critical authentic context (Herrington & Oliver, 2000). Advances in technology and the ability of multimedia to effectively depict real world situations reinforce that view. Further, technology can provide the means of students being 'exposed to experts'. The inclusion of real world expert commentary on the machinima sequences by a practising Crown prosecutor and defence barrister serves a number of purposes as part of that approach. The expert commentary emphasises key theoretical principles in practice. In combination with machinima portraying the court proceedings, it also models analytical techniques. Finally, it provides an alternative method for engaging learners with the authenticity of the video, its relevance to real world practice and its relationship to their future professional identities (Perrone & Vickers, 2003).

Conclusion

It is a common experience in Australian law schools that criminal law is taught in an abstract, decontextualised fashion by way of passive transmissive lectures. However, as Lin, Hmelo, Kinzer and Secules (1999, p. 44) observed, 'technology, properly designed and used, enables us to realise reflective learning environments that were not previously possible'. *The Sapphire Vortex* represents an effective and engaging use of technology to provide students with an authentic context to their learning of criminal law. The use of *Second Life* machinima has enabled the creation of a dynamic and realistic narrative while the expert commentaries are a powerful additional strategy for promoting the convergence of theory and real world practice. It demonstrates not only leadership in adapting curriculum in a climate of change but also facilitates students' learning for their future careers.

Implementing a learner response system in one university

Chris Campbell
School of Education
The University of Queensland

Although students expect to be engaged in lectures, it has been acknowledged that this can be challenging at universities across the world. When students lack engagement, attendance at lectures can be affected and students can become disengaged from the course. For these reasons and more it was decided by academics who lecture at one Australian university to implement a learner response system (LRS) for their large first year Education cohort. This paper investigates the literature and focuses on this implementation as well as initial data obtained by a group of first year students.

Keywords: learning response system (LRS), clickers, higher education, teacher education

Introduction

This paper describes the implementation process of a learner response system in a School of Education at one Australian University. There was a perceived need by some of the lecturers in the School to increase student engagement in lectures, particularly in the large first year lectures with several hundred students enrolled. The tertiary teaching environment requires us to be up-to-date with technology including what to use, how to use it, the rationale for using it and to be totally convinced of its merits. As lecturers, some technologies are helping us provide more flexibility in delivering course content (such as the availability of the Lectopia lecture recording system and the Blackboard learning management system) but these do not necessarily engage all students in a course. It can be a fine balance to maintain student engagement in a course when there is no longer a necessity for students to be physically present at a lecture. The possibilities for losing face-to-face contact with students, along with other debates around pedagogical practices such as including tutorial attendance in assessment, makes for a controversial space to discuss the relationship between new technologies and student engagement. With a diversity of tertiary students, many of whom are engaged in several hours paid work while being enrolled in university studies, and who are confident users of social media technologies, the challenges of maintaining engagement throughout the course of a lecture can quickly impact upon their level of success in the early part of the university studies.

There are many factors that determine whether lecturers will incorporate new technologies into the planning of their courses. Notwithstanding the time needed for professional development, there is an initial reluctance to trial new technologies with a new cohort of students, particularly in a first-year course. These courses often have large numbers of students who, at an early stage in their tertiary studies, can be reluctant to participate in class discussions. However, it is precisely because these large cohorts of students need to be able to quickly engage with both the course requirements as well as a new learning environment that there is an urgency to look for effective tools to enhance student participation. Another factor is the potential for new technologies to 'fall over' during lectures.

Literature Review

Clickers have been used in higher education for almost two decades and due to this there have been various types of research conducted on them. There is now a detailed body of literature that surrounds the implementation and use of clickers in various higher education contexts (For example: Barnett, 2006; Caldwell, 2007; Cheesman, Winograd, & Wehrman, 2010; Hall, Collier, Thomas, & Hilgers, 2005; Koenig, 2010; Milner-Bolotin, Antimirova, & Petrov, 2010; Strasser, 2010). They have particularly been used in science courses with large enrolments (Cheesman et al., 2010). In a study of first year physics students, the researchers defined clicker effectiveness as "student perception of how much clicker pedagogy helped them stay engaged in class, understand the material, get continuous formative feedback on their progress, clarify difficult concepts, and reflect on their own learning" (Milner-Bolotin et al., 2010, p. 16). Caldwell (2007) has suggested that using clickers offers a flexibility for learning as they can be used effectively in both lectures and tutorials and can be used with many different styles of questions. Trees and Jackson's research of 1500 undergraduates enrolled in seven large courses across three university departments have been reported and they suggest that there are a number of factors contributing to student's positive reception to using the clickers in class. These include the view that traditional lecture styles aren't the best, a desire to be engaged and involved in the class, valuing feedback as well as previous experiences with lecture courses (Trees & Jackson, 2007).

By using clickers in large groups it allows both the students and the lecturer to get feedback. Students can be given feedback on their responses and the knowledge they have gained on a particular topic. In an earlier study it was reported that one of the positives about students using the clickers is that they like receiving feedback on how well they actually understand the material they are learning. Students also reported enjoying the interactivity in class (Barnett, 2006). However, much of this literature focuses on the use of clickers in sciences where short-answer responses can help students and lecturers monitor progress. It also allows the lecturer to have feedback on how well the students understand the content they are teaching (Lantz, 2010).

One study presents positive results in using clickers in teaching, although having to make significant changes to actual teaching to see these results (Kolikant, Drane, & Calkins, 2010). This study used clickers in undergraduate math and science classrooms in the United States and results suggest that the use of clickers does not generally occur instantaneously in the classroom but is a gradual one where the instructors firstly needed to overcome various challenges. However, the study suggests that the use of clickers "may act as a powerful catalyst to transform them, moving them from teacher-centered conceptions and approaches to teaching to student-centered conceptions and approaches" (Kolikant et al., 2010, p. 134).

Another quantitative study focusing on an undergraduate operations management course investigated how the use of clickers affected learning outcomes (Yourstone, Kraye, & Albaum, 2008). The results suggest that the use of clickers "can have an impact on student learning as measured by test scores" (Yourstone et al., 2008, p. 85). The authors of this paper go on to comment that it may not actually be the clicker technology that is responsible for the improved learning outcomes but the actual immediate feedback provided to the students through the use of the clickers.

Implementation and Methodology

After reviewing the available learner response systems it was decided that the School of Education would purchase the Promethean brand. So, in May, 2011, the School of Education purchased 64 ActivExpressions, the hand held learner response system and 300 licenses of ActivEngage. This is the online system where the students use their own laptops to complete responses in a lecture. Students are required to 'register' their device on the system at the beginning of each class or semester. As this can be time consuming, due to the students not having it set up or the correct wireless etc, it was decided that they would only be registered once per semester. This required all students who wished to use ActivEngage on their laptops to register at the one time or they would miss out. For the lecturer they could use a software program called ActivOffice to create the questions either prior to class or on the spot in the lecture. This program works in PowerPoint which is familiar to all lecturers. It also works in an interactive whiteboard software program called ActivInspire, which many lecturers are not familiar with.

ActivEngage was used as soon as it was purchased for 3 lectures in May 2011. The cohort were first year education students enrolled in a first year compulsory ICT course called Learning Tools for the 21st Century. The setup was almost one lecture in time and involved quite a few support people. Numerous problems were encountered at this lecture. These included students

- not have Eduroam wireless network preinstalled on their laptop computer,
- not downloading the installation file prior to class, and;
- not entering the registration details correctly while in class.

Students were given the one opportunity to register in this class for the rest of the lectures during the semester so it was important that problems were solved if possible.

In Semester 2, ActivEngage was initially used in a lecture for a first year sociology in Education course called Introduction to Education. However, due to difficulties in the lecture it was decided that the trial would continue with one tutorial group. As the group was approximately 20 students in size the ActivExpression devices were used most weeks for the rest of the semester. Results of this implementation were positive with tutorial attendance being high, and with the students "more confident and thoughtful in relation to providing responses to questions during class discussions" (Campbell & Monk, 2012, p. 5).

Semester 1, 2012, began full of promise and ActivEngage was introduced to both first year cohorts in the one lecture. This was planned for well and students were not allowed into the room unless they had Eduroam working on their computer (although they were sent to the library nearby to get it working so that they could come back). Some students had problems with the registration code, and although it took quite a bit of time it was much easier than previously. ActivEngage was then used for the next 11 weeks in the first year ICT course and it was used a total of four times in the first year sociology course.

The students in the first semester, first year ICT course had the opportunity to use ActivEngage each week in the lecture until the end of the semester. For those students who were unable to register their laptops it was discovered through trial and error that the ActivExpression devices would work in conjunction with ActivEngage. This meant that students could pick up a 'clicker' at the beginning of each lecture and both systems would appear to give one integrated approach to the user. The system was set up to allow the students to respond anonymously.

At the end of the semester the students in the course were asked to complete a survey about their experiences using the learner response system. They were asked how many lectures they attended as well as how many times they used the clickers. Students were then given a range of statements to state whether they strongly disagree, disagree, agree or strongly agree. From the 219 students enrolled in the course there were 111 students who participated in the survey. Students were also asked a range of open ended questions in order to ask them to explain their reasoning for the various answers. In this course there were three different ways in which the clickers were used. These were for research, in other words, the lecturer was trying to find out particular things, for formative questioning and for open ended opinion questions that the lecturer wanted the student's opinion about. Results show that students were positive about using the learner responses.

Students who attended the lectures were generally positive about the use of the LRS in the lectures. Students commented that the voting in class "reinforced information", "allowed for shared ideas and responses" and that "more feedback and clarification was possible". Open ended questions were often used in the lectures with students required to type in a text answer. This allowed for a variety of student responses, with one student commenting it enabled students to see "other views than my own". These responses suggest it can be a powerful teaching tool in the classroom, and not just in lecture theatres. Another student commented "found it amusing and fun to participate in a way that was new and different to ways of learning that I have previously experienced".

Further Directions

In Semester 2 this study will continue with an implementation in the first year sociology course. It will be used in nearly all lectures with a variety of guest lectures. This provides potential new research areas as most guest lecturers will not have experienced using a learner response system in their teaching and potentially an investigation will provide insight into changing pedagogy. Semester 2 students will also have an advantage with using this technology as there is now an App available for iPhones and Android devices. The App is being trial by Faculty IT and will be available for students to download in Semester 2. It is hoped that between using the laptops, apps or the ActivExpressions all students will have a device to use.

Conclusions

This paper describes an implementation process of a learner response type system at one university. It is hoped that by sharing this journey other universities may be able to avoid some of the problems that occurred during this period.

It does appear that the students engaged in the class with greater depth when they were able to use the clickers. Massingham and Herrington (2006) report in their study on student attitudes, participation, performance and attendance in tutorials and lectures that engaging students with greater depth is an important factor in lecture attendance. Thus, student engagement is an important aspect in lectures and by using clickers this may contribute in a positive way to the class.

This study concurs with previous research that students are more engaged in lectures when they are able to use a learner response system in class (Strasser, 2010). Using clickers in class also appears to allow the students to get continuous formative feedback on their progress (Milner-Bolotin et al., 2010) which students in this cohort also commented on.

Although there were some initial problems setting the learner response system up, from student responses it appears to have been well worth the effort. The lecturers involved in this study look forward to using it again in Semester 2, 2012, and in the same courses next year with a new cohort of students.

Leadership in Online Learning: Developing the Next Generation of Leaders

Bruce N. Chaloux
Executive Director and Chief Executive Officer
The Sloan Consortium Inc. and
IELOL Co-Director, Sloan-C

Dr. Bruce N. Chaloux was named Executive Director and Chief Executive Officer at The Sloan Consortium in March, 2012. Prior to assuming his new position, he served as the director of Student Access Programs and Services at the Southern Regional Education Board (SREB) in Atlanta, Georgia. In this role, he developed a number of programs designed to help students start or continue their education, in particular SREB's Electronic Campus, providing access to over 30,000 online courses and 1500 degree programs. Prior to assuming his duties at the SREB in 1998, Dr. Chaloux served in the Graduate School at Virginia Tech for thirteen years, including four years as associate dean for Extended Campus Programs at the institution's main campus in Blacksburg and earlier as the head of Tech's Northern Virginia Graduate Campus in suburban Washington, D.C. He previously held positions on the staff of the State Council of Higher Education for Virginia and as an academic affairs administrator and faculty member (business administration) at Castleton State College (Vermont). He was named a Sloan C Fellow in 2010.

Mark Brown
Director, National Centre for Teaching and Learning and Director, Distance Education and Learning Futures Alliance
Massey University

Professor Mark Brown has specific responsibility for policy, strategy and leadership of teaching and learning development at Massey University. Over the last five years Professor Brown has played a key leadership role in the implementation of several major university-wide digital learning and teaching initiatives, including the enterprise level deployment of Moodle (aka Stream) and the original development of the open source Mahara eportfolio system. Mark has also been centrally involved in designing several online professional development modules in learning design and leadership training for senior university managers as part of a larger international project. He serves on a number of international journal editorial boards, has published extensively in the areas of online, blended and distance learning and is on the executive committees of the Australasian Society for Computers in Learning in Tertiary Education (ASCiLiTE) and the Distance Education Association of New Zealand (DEANZ). He is also a recipient of a National Award for Sustained Excellence in Tertiary Teaching.

Lawrence C. Ragan
Director for Faculty Development, Penn State's World Campus and IELOL Co-Director
The World Campus

Dr. Lawrence C. Ragan directs the design and development of a wide range of faculty development services and systems for Penn State's Academic Outreach. Academic Outreach serves learners via online (the World Campus), Continuing Education, and the video learning network. Dr. Ragan designs and delivers professional development programs, establishes a faculty development learning community, and conducts research including the articulation of strategies to help faculty manage the online workload (SMOW) and the definition of competencies for online teaching success (COTS). He has served in leadership roles as co-director of the EDUCAUSE Learning Technology Leadership program (2005–06), and is currently co-director of the Penn State/Sloan-C Institute for Emerging Leadership in Online Learning. He was named a Sloan-C Fellow in 2011.

Intended audience and degree of expertise/past experience required

This program is designed to explore and examine the challenges facing the next generation of leaders in online learning. Ideal participants would be individuals poised within their institution or organization to assume increased leadership responsibilities OR individuals responsible for identifying and preparing the next generation of elearning leaders. Individuals should have a "working" understanding of the issues facing the growth and development of elearning activities at the institutional, state, national and global level.

Statement of objectives for the workshop

Participants in this workshop will:

1) explore and examine a range of forces impacting the development of elearning activities in higher education institutions and organizations;
2) be introduced to the dimensions of leadership development necessary for success in the complex and dynamic context of elearning in higher education
3) compare and contrast leadership challenges in different countries, educational settings and political environments; and
4) become familiar with the structure, goals, outcomes and benefits of the IELOL and how it may serve the professional development needs of merging leaders in elearning from around the world.

Detailed description

The Sloan Consortium and the Penn State World Campus are proposing a pre-conference workshop focused on emerging leaders in e-learning programs. Specifically this workshop will address the rapidly changing landscape of higher education which provides the context of elearning as a new and viable alternative learning system. This workshop will feature senior leaders in the field, using a tested model of working with professionals on leadership issues areas related to unit operations, institutional policy, and personal leadership style.

The growth of online learning has created significant opportunities for higher education institutions globally, bringing many new institutions into the distance education community and transforming the role of distance education in other institutions. We are now well into the second decade of elearning and a new challenge of leadership is emerging. Many of the pioneering elearning leaders in our institutions are nearing retirement or moving on to broader leadership roles. Thus to ensure effective succession planning, we need to develop the next generation of leaders, preparing them as change agents and managers in the field. Many in this next generation of leaders will emerge from careers in elearning and with a growing number of institutions placing great strategic emphasis on elearning, a situation dramatically different from the earlier periods of initial growth and acceptance of elearning.

"The Emerging Leader in Online Learning: Context and Challenges" is an outgrowth of the highly successful Institute for Emerging Leadership in Online Learning (IELOL) program, a collaboration between the Sloan Consortium and the Penn State World Campus in the United States. Since 2009, the Institute, using a blended format that combines both online and in-person programming, has brought together an international community of more than 100 educators designated by their institution as emerging leaders. Working with a faculty of senior leaders from the Sloan Consortium community, the Institute has focused on creating change leaders for the future. This effort built on the success of the Administrative Leadership Institute, a workshop held for several years by the two organizations as part of the annual Sloan Consortium Worldwide Conference (ALN).
The proposed workshop is modelled after the Institute and is designed to give participants a 'slice' of the full program. The workshop will use the Sloan Consortium's five "pillars of quality" to illustrate the different operational and policy dimensions involved in building a leadership culture in a university-based e-learning operation. These quality pillars embody the ideals of online education in a quick, holistic view of continuous quality improvement and provide a helpful framework for the challenges of leadership.

The pillars include:

1) **Access**--All learners who wish to learn online have the opportunity and can achieve success.
2) **Learning Effectiveness**--The provider demonstrates that online learning outcomes meet or exceed institutional, industry, and/or community standards.
3) **Student Satisfaction**--Students are successful in learning online and are typically pleased with their experiences.
4) **Faculty Satisfaction**-- Faculty achieve success with teaching online, citing appreciation and happiness.
5) **Scale (Cost Effectiveness and Commitment)**--Institutions continuously improve services while reducing cost to achieve capacity enrolment.

Around this framework, three strategic leadership areas will be addressed:

- **Operational Leadership** –This section of the workshop with identify leadership issues, challenges and strategies in each of the five quality pillars.
- **Policy Leadership** – This section of the workshop will focus on leadership strategies needed to address both institutional and external policy issues related to creating a transformative innovation in the mainstream of a higher education institution. In many institutions, elearning began as an innovation that operated outside the institutional mainstream. Today, elearning is becoming recognized as a transformative innovation that will help institutions adapt to changing societal and individual learner needs. Increasingly, emerging leaders need to work within the mainstream to achieve sustainable success.
- **Personal Leadership Style** – This section of the workshop will explore several dimensions of personal leadership style needed to create change in this kind of institutional culture. Many leadership development programs grow out of corporate management experience. However, higher education is a unique social institution, regardless of how it is funded. Leading change in this unique environment requires personal and professional skills that are better suited to a large and often decentralized community.

Participants will engage in a variety of activities during this interactive one-day workshop and will establish a community where efforts with fellow participants and workshop facilitators will continue beyond the workshop.

Evolution of a higher ed curriculum based ecosystem

Christopher James Cheers

In a Higher Education context learning is an individual experience within a learning community. Such a community no longer needs to be bound by temporal or spatial limitations. Drawing on concepts found in Complexity Science, Ecological Psychology and Distributed Cognition this paper argues that educational design needs to focus on supporting the dynamics and flow of interaction, the exchange of ideas and negotiation of meaning within a curriculum based ecosystem.

Keywords: Complexity Science, Ecological Psychology, Curriculum Based Ecosystem

The dynamics of our lives have changed. Our senses and cognitive processes have been extended and supported beyond our physical selves. We live in a world that has been described as a 'digital ecosystem' where the physical and the virtual are fully intertwined and functioning through well-designed, well-integrated social and technical architecture working together in a wireless mesh that is persistent, pervasive, and mobile (Suter et al 2005). This digital ecosystem is an open, flexible, demand driven, self-organising, collaborative environment. It can, and has, enhanced our abilities to connect with other people, share ideas, work collaboratively and form communities.

Our students are becoming very comfortable with this digital world, at home with its tools and processes. Today's learners increasingly have access to, and use a broad range of social networking tools and technologies that provide a constantly evolving multiplicity of interactive resources for information and communication. As such learners expect to see this diversity reflected in their educational experiences. If our educational practices are to remain relevant our higher education institutions must also embrace this evolving digital age. Unfortunately traditional transmission models of education (reinforced by widespread use of instructivist teaching approaches and top-down management structures) seem to still dominate our educational institutions. (Garrison et al 2003, Laurillard 2006).

> Technological innovation in higher education has been largely restricted to administration and research. The significant technological innovations in teaching and learning have been confined to addressing issues of access and convenience. However, addressing the relevance and quality of the learning experience demands that higher education take a fresh look at how it approaches teaching and learning and utilizes technology. (Garrison & Vaughan, 2008)

Virtual learning environments and social networking solutions have the capacity to cater for a diverse range of learner initiatives and learner interactions. The learner can be provided with opportunities to interact with the tutor, other learners, course content (readings and other resources), and external experts. Learners therefore, have access to a rich socio-cultural context. Unfortunately, the adoption of these technologies seems to have been more about the preservation of the status quo than any paradigm shift. Higher Education practices need to reflect the dynamics of the digital ecosystem our world has become. This requires a major change in current practices if we as educators are to provide our students with educational experiences which will enable them to develop the attitudes, skills and knowledge needed to meet the challenges they will face as professionals in this constantly evolving digital world.

It has been argued that we do not learn a set of rules or abstract theories that we then apply in our interaction with the world. We in fact internalize a common set of practices, roles and ways of thinking that are provided by the current predominant paradigm (Imershein 1977). Knowledge is structured within a paradigm, supporting a particular worldview that defines an understanding of what can be achieved; the paradigm itself guides activities along particular directions. So implementing alternative educational approaches without changing the fundamental underlying paradigm tends to have little or no effect on actual practice. An alternative paradigm needs to be used if real change is to occur, and exemplars based on this paradigm need to be developed to provide concrete models to support change in practices (Kuhn 1970, Imershein 1976).

Our current curricula are not designed to mirror the complex dynamic world we live in and expect our students to be able to function in and succeed in as professionals. Curricula as we find them across our institutes of Higher Education have their roots in Europe in the 1500's. The term 'curriculum' was first used, in an educational sense of a course of study at a university, by Petrus Ramus, Regius Professor of Logic, in the late 16th century. Ramus' ordering and classification of courses and knowledge is fundamentally reductionist (Doll 2012). Reductionism is the belief that the whole can be understood if you understand its parts; that by dividing something under examination into as many parts as possible is the best way to understand that thing. It is the belief that by reducing everything to its simplest parts universal laws can be discovered and/or applied. It has been the foundation of scientific method since the time of Descartes and Newton (Mitchell 2009, Smitherman 2005).

This has led to the prevailing view in education that curriculum design should be based on the categorization and organisation of content to be delivered and learned. However it has been realized that while reductionism has its place as a scientific method it does not provide the means to explain much of our world.

> Many phenomena have stymied the reductionist program: the seemingly irreducible unpredictability of weather and climate; the intricacies of and adaptive nature of living organisms and the diseases that threaten them; the economic, political and cultural behavior of societies; the growth and effects of modern technology and communications networks; and the nature of intelligence and the prospect of creating it in computers. (Mitchell 2009)

Complexity science

A complexity paradigm provides us with the alternative view of the world we need for real change to occur; one that sees it as complex and unpredictable, one where relationships are non-linear and dynamic. It is made up of complex adaptive systems where intelligent agents anticipate the behavior of others and the external environment, and modify their behavior accordingly. Complexity science is not one theory but a combination of theories and concepts informing a wide range of disciplines including physics, biology, chemistry, mathematics, economics, sociology and a growing number of others.

Common properties of complex systems are:
1. Complex collective behavior: They consist of large networks of individual components (eg. ants, neurons, stock-buyers, website creators) each typically following relatively simple rules. It is the collective actions of vast numbers of components that give rise to the complex, hard-to-predict, and changing patterns of behavior.
2. Signaling and information processing: All these systems produce and use information and signals from both their internal and external environments.
3. Adaptation: All these systems adapt – that is, change their behavior to improve their chances of survival or success – through learning or evolutionary processes.

(Mitchell, 2009)

Concepts drawn from Complexity Science relevant to education include:
- The whole is greater than the sum of its parts: a complex system cannot be understood by dividing it into parts.
- Emergence: the process by which new patterns, features, qualities or products result from the non-linear interactions of agents within the system. Emergence is driven by the self-organizing nature of a system far-from–equilibrium.
- Self-organization: the tendency of many systems to generate new structures and patterns over time on the basis of its own internal dynamics – order emerges from patterns of relationships among individual agents.
- Non-linearity: actions can have more than one outcome and can generate non-proportional outcomes.
- Far-from-equilibrium: systems in far-from-equilibrium states evolve and adapt to changing conditions and spontaneously self-organize with structures of increasing complexity.
- Co-evolution: the process of mutual transformation that takes place for both the agent and the environment in which it exists.

When curriculum design is viewed from a complexity science perspective the focus shifts from curriculum content to the underlying processes of the complex adaptive system that is a discipline, a profession. We discover a world where the whole is greater than the sum of its parts. A perspective of curriculum stemming from the complex non-linear dynamics of such a world can spark new notions of epistemology and pedagogy. Through the use of concepts associated with complexity theories, new visions for curriculum can emerge (Smitherman 2005).

Curriculum based ecosystems & ecological psychology

Complexity Science provides us with the language and concepts to describe the nature and dynamics of our world as a digital ecosystem. To build further on this we need to be able to describe how human beings as independent agents within such a system find meaning, know and learn. Developments in ecological psychology provide us with the means to do this.

> … many contemporary thinkers from a variety of domains describe knowing not simply as a psychological construct existing in the head but as an interaction (or what Dewey, 1938, referred to as a *transaction*) of individuals and physical and social situations. (Barab & Plucker, 2002)

This ecological view of psychology takes as fundamental the interaction of agent and environment. Rather than explain things as all inside the head of the learner, explanations emerge from learner-environment interactions that are whole-body embedded in the lived-in world experiences. Interaction is dynamic and continuous, not static or linear (Young, 2004). Ecological psychology is based on the premise that perception and knowing is a property of an ecosystem, not an individual, and is co-determined through the individual–environment interaction. All environments have certain affordances that allow an individual to perform an action or actions and achieve a goal.

> Gibson (1979/1986) introduced the relational terms affordance and effectivity. An affordance being a specific combination of properties of an environment, taken with reference to an individual, that can be acted upon—opportunities for action (Gibson, 1977). Reciprocally, an effectivity is a specific combination of properties assembled by an individual, taken with reference to the environment, that allow for the dynamic actualization of a possibility for action. (Barab & Plucker (2002)

An ecosystem can be seen as an affordance network, that is a collection of facts, concepts, tools, methods, practices, and even people, taken with respect to an individual, that are distributed across time and space and are viewed as necessary for the satisfaction of a particular set of actions or goals (Barab & Roth 2006). An affordance is a possibility for action by an individual and an effectivity is the dynamic actualization of that affordance. An effectivity set constitutes those behaviors that an individual can produce so as to realize the potential of an affordance network.

Many educational practices implicitly assume that conceptual knowledge can be abstracted from the situations in which it is learned and used, this assumption inevitably limits the effectiveness of such practices. Knowledge is situated, being in part a product of the activity, context, and culture in which it is developed and used (Brown et al, 1989). Knowing and meaning, and therefore learning, is part of the dynamic interplay of individual and environment. When designing curricula we need to recognize this and design to support the dynamics and requirements of the ecosystem of the chosen profession or discipline. Learners need to be provided with opportunities to develop the effectivities needed to function effectively and succeed in the affordance network or ecosystem of their chosen field.

How do we identify the 'effectivities' that need to be integrated into the design?

The concept of distributed cognition provides us with a basis for identifying these effectivities. We need to understand the emerging dynamic of interaction within the complex networked world of a digital ecosystem. The theory of distributed cognition has an important role to play in understanding interactions between people, technologies and environments, as it's focus is on whole environments, what we really do in them and how we coordinate our activity in them.

Distributed cognition looks for cognitive processes, wherever they may occur, on the basis of the functional relationships of elements that participate together in a process. While traditional views look for cognitive events in the manipulation of symbols inside individual minds, distributed cognition looks for a broader class of cognitive events. For example, an examination of memory processes in an airline cockpit shows that memory involves a rich interaction between internal process, the manipulation of objects, and the traffic in representations among the pilots.

At least 3 kinds of distribution of cognitive process have been identified:
- cognitive processes may be distributed across the members of a social group
- cognitive processes may involve coordination between internal and external (material or environmental) structure
- processes may be distributed through time in such a way that the products of earlier events can transform the nature of later events

Hollan et al (2000)

Culture, social organization, the structure added by the context of an activity, and the tools used to complete that activity, are all forms of cognitive architecture.

> … in the distributed cognition perspective, culture shapes the cognitive processes of systems that transcend the boundaries of individuals [Hutchins 1995a]. At the heart of this linkage of cognition with culture lies the notion that the environment people are embedded in is, among other things, a reservoir of resources for learning, problem solving, and reasoning. Culture is a process that accumulates partial solutions to frequently encountered problems. Without this residue of previous activity, we would all have to find solutions from scratch. We could not build on the success of others. Accordingly, culture provides us with intellectual tools that enable us to accomplish things that we could not do without them. (Hollan et al 2000)

Knowing and meaning, cognitive activity, is constructed from both internal and external resources, the meanings of actions are grounded in the context of activity. It is not enough to know how the mind processes information, it is essential to also know how that information is arranged in the material and social world. We interact with, and within, the structure in environments, ecosystems. To design effective curricula we must know what that structure is and how it can be organized, the processes individuals and groups engage in and the resources and tools they use to render their actions and experiences meaningful. We need to have an understanding of information flow, cognitive properties embedded in systems, social organizations, and cultural processes.

An ecological view of the world requires a shift of focus in education to learner's interactions rather than the dissemination of information. We need to design experiences that are a true reflection of professional practice in the real world and provide an environment/ecosystem that supports, and in fact enhances, the evolution and emergence of professionally relevant attitudes, skills and knowledge in those engaged in and traveling through a curriculum based ecosystem. We have to support the dynamics and flow of interactions, the exchange of ideas and negotiation of shared meaning, and the engagement with others in a community of inquiry, within and around a professionally relevant educational experience (Cheers et al, 2011).

The author is currently conducting research into the design of a curriculum based ecosystem for Higher Education.

Extrinsic and intrinsic barriers in the use of ICT in teaching: A comparative case study in Singapore

Wenli Chen
National Institute of Education

Nanyang Technological University

This study examined the use of ICT for teaching undertaken by two primary school teachers at pre-examination period and at post-examination period. Their perceptions of using ICT for teaching and learning and their ICT experiences were also analysed. The results showed that both teachers improved in ICT integration from Adoption stage to Adaptation stage after examination (when the curriculum is more flexible and teachers had more time for lessons), with increased scope and sophistication in ICT use in classrooms. These observations confirmed that extrinsic barriers - time and curriculum constraints - are negatively impacting ICT integration of teachers.

Keywords: ICT integration, time constraint, curriculum constraint, case study, Singapore schools

Introduction

The benefits of integrating Information Communication Technology (ICT) in enhancing classroom learning and teaching have been well documented in education research (Sutherland, 2004; Korte & Hüsing 2006; Grabe & Grabe, 2007). Educational researchers and practitioners are making every effort to pursue "ubiquitous computing" (Weiser, 1991) in which technologies are woven into diverse dimensions of pedagogical practices in formal educational contexts. Singapore is no exception in this regard. To make "ubiquitous computing" a reality, the Ministry of Education in Singapore has launched a series of ICT Masterplans (MOE, 2008) and the Programme for Rebuilding and Improving Existing Schools (PRIME) (MOE, 2008) to promote the meaningful use of ICT In schools.

With the cognition that ICT integration will not naturally happen by solely providing technological "assets" (Horrigan, 2007) in classrooms, teacher development activities are designed and implemented to augment favorable "actions" and "attitudes" toward technology in the agents of change of classroom practice. In the National Institute of Education (NIE) of Singapore, the teacher training institute for all public school teachers, courses concerning ICT use for educational purposes have long been incorporated into its teacher training programs. Given the extensive support for teachers, one might assume that ICT use in classrooms should improve and inspire the transformation of traditional pedagogical practices. According to Cuban (2001) and the Office for Standards in Education (2004), the adoption and integration of technology into classroom learning and teaching is behind expectations. In practice, ICTs are either scarcely used or only used to supplement traditional and frontal teaching (Redecker, 2009).

This reality makes investigating the factors that compromise ICT integration in school settings imperative. There have been scholarly efforts made for this end. Informed by previous research, the present study explores the issues that undermine teachers' ICT use in authentic, regular classrooms in Singapore via a comparative case study approach. The findings in this micro-analysis can help school authorities and policy makers to plan interventions to encourage ICT use and the progression of "ubiquitous computing" in Singapore schools.

Research Goal & Framework

In existing literature, there has been discussion concerning the barriers that teachers face in using ICTs from a general perspective. Peggy Ertmer (1999) classified those exposed into two categories: 1) Extrinsic barriers, first order barriers that result from inadequate and/or inappropriate configuration of ICT infrastructures, including access, time, support, resources and training; 2) Intrinsic barriers, second order barriers that related to teachers' personal experience and awareness, including attitudes, beliefs, practices and resistance.

Previous studies have extensively investigated teachers' beliefs and attitudes toward ICT adoption and the results indicate that most teachers were positive about ICT integration as it makes learning more effective and teaching and learning resources easier to reach (Gulbahar & Guven, 2008; Prestridge, 2012). Thus, the unsatisfying implementation of ICT-supported learning and teaching could probably be ascribed to the lack of Technological Pedagogical Content Knowledge (ICT-TPCK) (Angeli & Valanides, 2009) to design and deliver effective pedagogies in technology enhanced learning environments and to the shortage of time and support for ICT use. In the Singapore context, the former is confirmed. Chen, Lim & Tan (2010) disclosed the existence of discrepancy between every ICT skills and those essential for teaching in pre-service teachers born after 1980, which limited their ICT adoption in teaching.

The time constraint for ICT use, to some extent, has been neglected in the Singapore context. Research into teachers' ICT use in other countries has identified the lack of time as a common barrier that most, if not all teachers face (Cuban, Kirkpatrick & Peck, 2001). Teachers, apart from finishing allocated teaching load, also help out in arranging and organizing both curriculum-related and unrelated activities and other administrative work. To many teachers, adopting ICT is additional work that is only looked at when there is extra time. Curriculum constraint, which is closely related to the time issue, has been confirmed as another barrier. Research done in North Carolina shows that teachers "having insufficient freedom to make decisions about content and pedagogy" (Kauffman, 2005) discourages teachers from exploring and experimenting with innovative teaching leveraged on ICTs. Illuminated, we would like to investigate whether the same barriers (time and curriculum constraints) exist in Singapore.

To achieve this, we observed and documented the ways two teachers used ICTs for teaching and learning during regular lessons (before the Primary School Leaving Examination, PSLE) and in post-exam lessons (lessons after PSLE). These two teaching periods were chosen as, in Singapore, after PSLE students still have to attend school but there is no longer a prescribed curriculum to follow, which gives teachers more freedom to plan and practice intended activities. Teachers also have more time due to reduced administrative work and school activities after PSLE. A comparative case study has been conducted to examine whether there was a discrepancy in ICT use between these two periods.

To describe the level of ICT integration of the teachers observed, we have translated the developmental trajectory of ICT use proposed by Dwyer, Rinstaff and Sandholtz (1991) into our context. According to this framework, teachers generally go through five stages in the process of incorporating ICTs into their classrooms indicated by their ICT-related teaching performance: 1) Entry stage, where the physical environment of learning starts to change with the introduction of ICT devices yet the learning activities and supporting tools used remain relatively traditional (e.g. pen, paper and books); 2) Adoption stage, where ICT devices are used but for traditional learning activities (i.e. using new tools for old practices); 3) Adaptation stage, where various ICTs are used with increasing depth and breadth, and integrated into specific learning scenarios; 4) Appropriation stage, where ICTs are routinely used and transforming pedagogical practices in a broader context (e.g. more extensive and frequent application of technology-enhanced collaborative learning) ; 5) Invention stage, where both the physical environment and teachers' mindsets about learning have been transformed and teachers are actively exploring and experimenting with new tools and activities to enhance learning effectiveness. In analysis, the level of ICT use of the teachers involved at both the pre and post examination period was examined and compared. It should be noted that in our study, the determination of ICT integration level was phenomena-based, i.e. based on the users' existing practice. The progression of ICT integration was thus defined as the improvement in the scope and frequency of ICT adoption which might and might not indicate the increase in users' competence in "ICT for teaching".

Participants & Data Collection

Two teachers, Tom and Paul, participated in this study. Both teachers were from a group of pre-service teachers who had responded to a call for volunteers for a research project in NIE to study the ICT habits and practices of pre-service teachers. Before graduation, this group of teachers was asked whether they would like to participate in the present study and these two teachers indicated their interest. Approvals were then sought from their respective schools for data collection.

Data was collected via lesson observations and interviews. Observation sessions were arranged once a month for a semester (from July to November). In practice, the researcher shadowed the two teachers throughout the whole school days. Observation notes, videos and photos were recorded and documented for analysis. The interview sessions took place right after the observation sessions. In the interview, teachers were asked about their perceptions and reflections on these ICT use experiences. All the interview sessions were audio-recorded and transcribed.

Data Analysis & Discussion

Adoption level at pre-examination period

Both Paul and Tom were found at the Adoption level of ICT integration before the examination. In Paul's lessons, most activities were supported by traditional tools and resources such as whiteboard and paper-based textbooks, workbooks and exercise books. ICT platforms were present but used infrequently. Basic applications such as PowerPoint presentations and visualizers were adopted most, but for very traditional practices. He used a visualizer for flashing worksheets, examination practice papers, passages and pictures for oral description. Sometimes, he used PowerPoint presentations to teach students the meanings of some new words. Only in one instance, he was observed using the online resources—the online timer to train his students to complete their work within time. Though a student portal – the LEAD Portal (an e-learning portal by Marshal Cavendish) was readily available in school, Paul did not use it often. He only turned to it when he lacked time to go through the answers of the examination papers with the students before PSLE. On these occasions, he merely used the portal to post answers and explanations for the students to look through on their own.

Compared to Paul, Tom adopted more ICTs in his teaching, yet his usage was still within the Adoption level. Whiteboard and paper-based textbooks, workbooks and exercise books were still the main vehicle for most learning activities. Sometimes Tom used digital textbooks (on his laptop) instead of the physical ones. The visualizer was the most common tool for presenting and demonstrating learning materials. Sometimes, he also used MS Word to take notes. Instead of writing the words out on the whiteboard, he typed the words out on a blank Word document (while the document was projected on the board) for the students to copy. He felt it was neater that way, and was easier for the students to read the typed words, as compared to the written words. To encourage student participation, he created a simple scoring programme using Flash to use in class and it worked very well with the students. Like Paul, Tom was also observed using an online timer. He used it during oral practice to remind students of the time passage in oral practice.

Adoption-Adaptation level at post-examination period

After the PSLE, ICTs were more significantly used in both teachers' lessons and these applications were of enhanced scope and effectiveness. Paul used significantly more ICT in his lessons and these applications were with enhanced scope and effectiveness. PowerPoint presentation was still mostly commonly used but Paul experimented with more functions. He played a charades-inspired game with the students on this platform. He also incorporated an activity about a girl caring for her mother in his PowerPoint slides to encourage students' reflections in class. Apart from basic applications, inspired by Amazing Race, Paul created a game specific for Primary 6 students via combing various ICT tools. In this activity, students had to apply skills such as typing in Chinese, searching web engines using Chinese and using online translator (Google Translate). During this process, he voluntarily reflected on the limitations of Google Translate and taught his students how to tell reliable online resources from unreliable ones.

Like Paul, Tom also brought the students to the computer labs more often after the PSLE. The post-examination activities for his Primary 6 students were also more creative and incorporated better use of ICTs. He created a game to test students' general knowledge and ability to read in Chinese using multiple ICT tools. In the learning activity, selected students were put in groups and the groups had to play against each other, while the rest of the students watched. There were various categories of questions to choose from and the students were also given options like polling the (student) audience, doubling their points for a question or throwing the question to another group.

From these observations, we found both Paul and Tom had enhanced agency in exploiting the affordances of ICTs within reach and improved awareness and techniques to address the changing requirements and side-effects brought about by the introduction of ICTs. From the evidence, we can see both teachers' progress from Adoption to Adaptation with regard to ICT use for teaching.

Time and curriculum constraints for limited ICT use

Apart from performance analysis, the investigation of teachers' perceptions of their ICT use experience offered further validation for pinning down time and curriculum issues as negative forces hindering ICT integration in classrooms. During the interview sessions, the two teachers were asked about their thoughts and reflections on ICTs. Paul directly cited the lack of time as the main reason he did not add much ICTs to his regular lessons. Activities like planning and preparing ICT-related lessons, bringing the students to the (computer) lab, setting up the systems was all quite time-consuming. There was also time needed for troubleshooting technological issues.

In addition, Paul felt the existing curriculum had somehow restrained his teaching. As a beginning teacher, he had "a certain curriculum to follow already, so it was not so easy to think out-of-the-box to and plan certain ICT instructional or even ICT-based activity for them (the students)" as "a lot of things are already in place". The academic activities for the year were already mapped out for teachers. There were workbook activities and other academic related activities like spelling tests (dictated by the heads of department) that the teachers had to complete, so little time was left for other activities. He also "didn't want to try anything new or incorporate certain things that they (the students) might not be used to".

Paul also mentioned that "ultimately, we are still preparing them (the students) for that (PSLE)", so a lot of drilling was necessary. That was the very reason why even if he had used ICTs, he used them for drills. The students were not going to be tested on their skills in ICT, so that was "not crucial". Moreover, the tests were to be done using pen and paper, not on the computer. That students learning using various ICT platforms would not help much or even make them slow and uncomfortable in doing pen and paper-based tests. Besides, he believed that incorporating ICT was only used to enhance students' interest and skills like the games he played with the students. Paul was "quite sure that whatever they learnt in terms of content today, they will not remember on Monday", though he believed that they would retain the skills they had learnt "because it's more kind of kinesthetic kind of work".

Like Paul, Tom perceived the press for time in using ICTs in his lessons. He complained that school computers worked too slowly and mentioned that compatibility and security issues when he used his personal laptop in school and solving these technical problems took up a lot of class time.

Tom also mentioned the same problem with existing curriculum that he was fully-occupied with planned learning content and activities so that he was so tired and "not energetic enough to do extra stuff". He also said that the focus for his teaching was on preparing students for PSLE.

Other barriers that limited ICT use

Apart from time and curriculum constraints, other issues also became evident from Tom's feedback. That teachers had not fully comprehended the needs and methods to integrate ICTs to transform traditional teaching was one of them. According to Tom, ICT tools were not so necessary for teaching a language. In his opinion, he could conduct his lesson by just talking and using the whiteboard (chalk-and-talk), even if the visualizer was not working, or if he had forgotten to bring the textbook to class. He deemed traditional classroom tools more than sufficient to provide for his teaching needs. To him, ICT tools were fancy add-ons, to "attract" the students by showing them video clips or animation clips. He felt that the "area and the opportunity to use ICT to enhance teaching is limited". According to him, "language is all about the interaction" and multimedia simulation was the same as him talking and gesturing ("The sound, I can talk, I have the sound. The video I, my gesture, it's still the same"). To him, using ICT was merely a different mode of presenting the lesson, but ultimately, the lesson content was still the same, so it did not make much difference.

Another source of problem lay with the lack of ICT infrastructure for linking formal and informal learning contexts. Tom found giving his students learning materials and assignments from the LEAD portal was "effective", but he did not continue to do so after trying a couple of times as students complained about the problems with their Internet connections at home which prohibited them from finishing the learning activity. As such, Tom only used the portal for supplementary purposes like uploading answer sheets, posting examples and spelling lists.

Conclusion

This paper reports a comparative case study of teachers' ICT use for teaching before and after the examination period. After analysing two teachers' ICT experiences and perceptions towards ICT for teaching and learning, extrinsic barriers - time and curriculum constraints - has been confirmed as discouraging ICT adoption in classroom settings. After the examinations, both the teachers used ICTs more extensively and effectively due to increased freedom for embracing more diverse and sophisticated ICT-supported pedagogical practices. Though curriculum being responsible for reduced ICT integration in classrooms is suggested, we do not argue for the eradication of existing curriculum but for the modification as curriculum can give teachers a clear sense of what to teach and foster teachers' on-the job training (Valencia, et al., 2006).

From these findings, it is recognised that policy makers and school authorities should make further efforts to better accommodate the "support" teachers and students need in leveraging on ICT supported learning environments if "ubiquitous computing" is to be attained. Apart from providing technology-centred support (e.g., ICT devices and software), people-centred support (e.g., initiatives that encourage ICT-related innovation in pedagogy and curriculum) are also needed to facilitate and stimulate teachers to explore and experiment in this area.

The study also revealed teacher beliefs and attitudes as well as ICT infrastructure as limiting factors. As these factors typically change over time, they could be further studied by comparing the findings from beginning and more experienced teachers.

It should be pointed out that this is an ethnographic study and is qualitative in nature. Data used was collected over several events with humans being "the research instrument" and "generalizability is interpreted as generalizability to identifiable, specific settings and subjects rather than universally" (Cohen, Manion and Morrison, 2000). Any application of findings and conclusions achieved in this study should be done with caution. Another limitation of this paper has been its sole focus on those extrinsic factors within the school context. As indicated in the interview data, these two teachers, if representative of other teachers, have not grasped the whys and hows in integrating ICTs and that there exists a lack of coherent infrastructure linking formal and informal learning contexts which also contributed to the encumbered ICT use. More extensive investigation is needed to offer a comprehensive capture of the factors impacting ICT integration.

Embedding eportfolios in teacher education: Lessons from a multi-year implementation

Christopher Allan
University of Tasmania

Ben Cleland
University of Tasmania

ePortfolios are being used in teacher education across Australia as a technology and as a process. They allow pre -and in-service teachers to showcase teaching practice against teaching standards and reflect on their practice throughout and after study. The University of Tasmania is implementing an eportfolio as an integral part of its Master of Teaching and Bachelor of Education programs to help with this process. This paper uses document analysis to describe the support strategies used in the previous two years of implementation of eportfolios at the university and outlines future plans for progressive implementation (including plans to change eportfolio technology and support implications). Some of the strategies used to implement eportfolios include: the use of a community of practice, the use of templates and scaffolds, support from L&T and IT infrastructure, embedding assessments in units; and modelling/building exemplars of effective portfolio practice.

Keywords: eportfolio, higher education, teacher education, e-learning, teaching standards

Introduction

The use of teaching portfolios has been around for many years. Bunker (2005) suggests that teaching portfolios can be used for demonstrating learning; career enhancement; professional development; as part of academic audits and review. According to Butler (2006) there are three main purposes of eportfolios in education: as a showcase of achievement; as a tool for assessment and/or certification; and as a record of learning over time. Teaching registration boards across Australia have focused attention on developing professional teaching standards to be used for certification, promotion and professional development. It is suggested that teaching portfolios can be an effective way to demonstrate professional standards and are now becoming a common strategy for assessing these standards (Zeichner & Wray, 2001; Smith & Tillema, 2003; Strudler & Wetzel, 2005).

Although there is potential for eportfolios in developing teaching portfolios there are issues that need to be considered before they can become a sustainable part of the curriculum. Wright, Stallworth and Ray (2002) studied the perceptions of students in an implementation of eportfolios in a four-year teacher education course. They identified a number of concerns including increased time commitment, lack of clarity regarding purpose and audience, and problems with the technology. The use of an eportfolio is not the same as creating a paper-based teaching portfolio. There is a need for students to develop eportfolio skills via training (Heath, 2005) and to develop technical knowledge (Abrami & Barrett, 2005). These aspects need comprehensive support and developing these skills takes time.

Context

In 2007 the *University of Tasmania* decided to make the use of eportfolios one of its strategic goals. In 2008/2009 the *Projects and Evaluation Unit* implemented a trial of eportfolio software with a number of staff and students. One of the cohorts that trialled and evaluated the eportfolio software was the Faculty of Education. In 2010 the University started a wide-ranging “progressive implementation of eportfolios” making eportfolios available across the university “to all UTAS staff and also available for student use within course[s] and units” (Allan, 2010, p. 3).

The initial evaluation of eportfolios by the Faculty Education included units within the course *Bachelor of Teaching*. This course had previously used a portfolio (a printed hardcopy version) which was used for the purpose of a “showcase portfolio” (Stefani, Mason & Pegler, 2007) and an “exit portfolio” (Constantino & De Lorenzo, 2006). The portfolio contained evidence of teaching performance standards, as detailed by the Tasmanian Registration Board (TRB), and was compiled by students to demonstrate mastery of these areas. The students worked on the eportfolio throughout the two-year course and then provided evidence of their performance against the TRB standards in the final unit (Poot, Oerlemans, Kertesz, Hawkins & Eversole, 2009, pp. 2-3).

After the trial, the Faculty of Education decided to introduce the eportfolio across two of their major programs: the *Master of Teaching* and the *Bachelor of Education* courses. The faculty was interested in developing the eportfolio process throughout its various offerings. Its intention was to get students to create a "developmental" (or working) portfolio throughout the course and to use the evidence and reflection from this portfolio as a final "evidential" (or exit) portfolio in a hope to demonstrate evidence against the TRB standards.

The eportfolio was planned to be used as both a formative and summative part of the *Master of Teaching*. It would have a summative assessment component in the final unit of the course: Preparing for the Profession. "At this time, the portfolio will be presented to a panel of assessors, and this process will result in summative feedback to the student and a final grade for the portfolio" (Fraser, 2009, p. 4). It would also have formative aspects throughout individual units and professional experience during the course.

Year 1 (2010): Get something up and running (but make sure it is supported)

In the first year the goal was to get something up and running and ensure there was enough support for students and staff. We knew, from experience, that if this was going to get off the ground then support would need to be abundant and available wherever needed.

The eportfolio plan for the Faculty of Education was that all students in the *Bachelor of Education* and the *Masters of Teaching* courses starting in 2010 would work on an eportfolio throughout their course. All these students would have access to an eportfolio system (PebblePad), mentors, and technical and educative support for this process. Students would complete an exit portfolio at the end of the course. The eportfolio was to have a number of purposes, including: to show the students' individual growth throughout the course; as a way for students to document their knowledge of teaching and their ability to teach; and for students to show their best work in relation to the teaching standards.

One of the advantages we had in the implementation was that we were able to get a degree of top-down support for the eportfolio project. There was endorsement from the University Learning and Teaching Committee including a highest level (H1) reporting requirement within the University strategic plan. This provided us with reasonable funding in our first year for Learning and Teaching and IT support and also expenditure for the software. We also had endorsement from the Faculty of Education Associate Dean of Learning and Teaching.

The major initiatives within the scope of the first year evolved around getting the support processes in place and in particular liberating academics from the technical aspects of eportfolios. It also included the provision of advice regarding learning and teaching aspects. We provided the following:

- **A comprehensive training and support package**. This included two sessions for teaching staff (*eportfolios for learning and teaching* and *how to create your own eportfolio*). The provision of at-elbow support for all units involved in teaching or assessment using the eportfolio tool (there weren't many in the first year). The development of support resources for tasks. IT Help Desk support for all staff and students using eportfolios.
- **The development of a small number of activities to promote the use of an eportfolio as a progressive task**. Learning & teaching staff supported a small number of units in developing tasks incorporating the eportfolio. One example involved students developing a professional experience blog to document experiences when on placement in school. This was intended to be a hurdle task (i.e. needing to be completed as part of Faculty requirements) but, as it ended up not being a requirement, students did not complete it.
- **The development of an Online Community of Practice (CoP)** using the current Learning Management System. An online site was created and supported by an experienced teacher and technical personnel (it was essential to have both). The community of practice provided a variety of key resources regarding the use of eportfolios, an FAQ section to support both technical and educative aspects of developing eportfolios, and web conferencing for student training and support. All students in the Faculty of Education had access to the CoP. It was not meant to be unit specific but a place where all students could ask questions about the eportfolio process.

Year 2 (2011): Embed into key units and model effective practice

The major lesson learnt from the first year was that if the eportfolio task was optional and not embedded within a unit then it is highly unlikely that students would participate – no matter what the long term value of the task was. We also realised that it was essential to give students (and lecturers) examples/exemplars of what was expected and also scaffolds and templates to support the process. Helping students to understand the purpose of an eportfolio and what was required to develop one was a key issue of year one.

The major focus for year two was embedding eportfolios into core units and grass roots initiatives. We continued to provide the support and training that we offered in the previous year (although much of the funding disappeared due to the changes in University priorities). We also continued to provide the Community of Practice for all staff and students. The major initiatives included:

- **Embedding eportfolio tasks within key units**. We decided to embed learning, teaching and assessment tasks within key professional experience units in both the *Masters of Teaching* and *Bachelor of Education* courses. We focused our attention on specific units that were consistent in both courses and that had a professional experience focus. Two of the units that we helped develop were the *Foundations of Teaching* and the *Preparing for the Profession* units (the first and last in the degree).
- **The development of a template for the final professional portfolio**. We developed a scaffold/template that was available to students from the beginning of their course and was used in the *Preparing for the Profession* unit. The template provided the students with an understanding of the TRB standards and the types of evidence and information that would be needed to support their case that they had achieved the standard. Students were able to copy the template, modify it with their own experiences and then submit this as part of the requirements of the final unit.
- **Inclusion of examples / exemplars of eportfolio practice**. In 2011 we had our first students complete their eportfolio. We collected a number of examples of student generated eportfolios with permission to use these as a part of the Community of Practice.
- **Documenting case studies of eportfolio tasks**. In 2011 we also collected a number of case studies designed by lecturers using the eportfolio. These case studies can be used in training and at-elbow support to help lecturers understand the kinds of tasks that can be developed within an eportfolio.

Year 3 (2012): Changing systems - transition

The third year saw the arrival of a significant new challenge: a decision by the University to move to a new eportfolio product. This new product would be integrated within a completely new Learning Management System (LMS) that the University would be progressively implementing in the second semester, 2012 and throughout 2013. The key objectives for this third year became:

- **Consolidating positive attitudes** towards the use of eportfolios within the Faculty.
- **The development of a migration plan** that moved students from one system to the other with the least amount of disruption or extra work for Faculty staff and students. The development of a plan to roll out the new eportfolio tool in semesters 1 and 2, 2013.
- The **introduction of the new eportfolio tool** to Faculty eLearning support staff and key academic staff.

The integrated nature of the new eportfolio tool offered a distinct advantage over the previous software. Staff and students will no longer need to access a separate system and learn to use a product with a different interface and support systems. When fully rolled out by the end of 2013, the new tool will have a familiar interface; a single login shared with the LMS; integrated help and IT support as well as the capacity to draw on assessment and content tools in the new LMS. The integration, however, also meant a re-evaluation of our approach to eportfolios and a rethinking of our eportfolio process. Previously the eportfolio was individually owned and only accessible by the student until work was purposely shared or submitted for assessment. It operated as a personal learning environment which could be continued after completion of the degree. The move to an integrated institutional system raises questions about how we promote the use and value of an eportfolio and also what training is conducted. This rethinking is ongoing and will continue to be a major consideration for our future development and use of eportfolios within the Faculty of Education.

The lessons learnt from the first two years are expected to provide a solid foundation as the project transitions to a broader audience. By the end of 2013 the new eportfolio tool will be available to all students and staff within the Faculty of Education and throughout the University. The combination of a structured workshop series, the delivery of at-elbow and technical support, scaffolding of eportfolio activities, the provision of templates and learner support materials and the development of Communities of Practice will continue to play an important part in the future success of this project.

Conclusion

If eportfolios are going to be used to showcase and reflect on teaching practice then appropriate measures need to be in place to support both the teacher educator and the teaching students. All users need to feel comfortable in the environment from a technical and from a learning and teaching perspective.

This study found that a combination of top down support from Learning and Teaching, IT and Faculty leaders and support through grass roots initiatives in eportfolio development is significant in the adoption of an eportfolio. This support will affect how the eportfolio is utilized and whether it is sustained throughout a program of study. The grass roots initiatives in particular need to be nurtured, supported and celebrated in order to develop positive attitudes and perceived value for teacher educators.

The eportfolio implementation in the Faculty of Education at the University of Tasmania is still early in its development. It will need further support to add value within its programs. It will be interesting to see how changes in the eportfolio system (PebblePad to Desire2Learn eportfolio) will affect the uptake and use of eportfolios in 2013. There are some positive indications that the new system will support greater integration between eportfolio use and learning tasks. Maintaining the positive attitude of staff and students within the faculty during migration will be a key consideration for this change to be effective.

Exploring Mobile Augmented Reality

Thomas Cochrane
Centre for Learning and Teaching
AUT University

Thomas Cochrane BE, BD, GDHE, MTS, Mcomp, PHD (Monash), is an Academic Advisor and Senior Lecturer in educational Technology at AUT University's Centre for Learning and Teaching (CfLAT). He was recently awarded as an Ascilite Fellow. His research interests include mobile learning, web 2.0, and communities of practice. Thomas has managed and implemented over 35 mobile learning projects, with a recent focus upon Android and iOS smartphones and the iPad as catalysts to enable student-generated content and student-generated learning contexts, bridging formal and informal learning environments.

Vickel Narayan
Te Puna Ako
Unitec

Vickel Narayan MComp, PGDComp, BSc (Comp Sc & Info Sys), CTT+, is an Academic Advisor (Learning Technologies) at the Centre for Teaching and Learning Innovation: Te Puna Ako, Unitec, New Zealand. He has a keen interest in Web 2.0 technologies and its potential to engage students and teachers in the teaching and learning process. Vickel is particularly interested in exploring mobile Web 2.0 tools for creating, nurturing and maintaining virtual communities, social connectedness, fostering social constructivism, student generated context and context. He is also interested in Virtual Worlds particularly pedagogical implications of their use in education.

Intended audience and degree of expertise/past experience required

- Educators wanting to explore or engage with mlearning and augmented reality
- Educators interested in ideas for enabling student-generated content and contexts beyond the classroom
- Ability to install and use smartphone/iPad applications.

Statement of objectives for the workshop

- Participants will gain an understanding of the educational possibilities of mobile augmented reality
- Participants will experience a variety of mobile augmented reality applications on their own devices
- Participants will create points of interest for a mobile augmented reality browser
- Participants will discuss examples of student-generated mobile augmented reality

Detailed description

Full programme outline available on Google Docs at:
https://docs.google.com/document/d/1oYHP5g9OlS8nCZUUpkEkaAFSAZP7RQJgWBvkxfbwcMw/edit

The session will include:

- An overview and demonstration of mobile augmented reality
- Examples of the educational use of mobile augmented reality
- A hands-on tutorial on how to create enhanced points of interest and an augmented reality layer for a mobile AR browser (e.g. Wikitude, Layar, and Junaio)

Organisation of the session

AR demo

Poll - what mobile device do participants own? http://www.polleverwhere.com
Establish use of back-channel via Twitter Hashtag for session. **#ascilite12AR**

AR Overview:
YouTube Playlist: http://www.youtube.com/playlist?list=PL91E9CED8BCC4CF76

AR Demonstrations:

- QR Codes
- High tech AR example
- AR mobile browsers (Wikitude, Layar, Junaio) – participants download Wikitude to their own device.
- AR mobile Apps (Nokia Point and Find, Google Goggles, SkyMap, Word Lens, urbanspoon, AR.Freeflight, etc…) – participants download 1-2 example AR apps to their own device.
- ARDrone - Quadracopter & Christchurch Quake
- CityViewAR
- Google Glasses
- Google Sketchup and AR Media
- 15 AR Apps for iPhone:

Presentations of student mobile AR projects
Links to educational research on mobile AR.
Other useful augmented reality resources
A how-to create POIs and a Wikitude layer
Participants create their own POI and Wikitude layer and upload and share them via Twitter
Overview of Junaio & Stiktu

Heutagogy and mobile social media: post Web 2.0 pedagogy

Thomas Cochrane
AUT University

Laurent Antonczak
AUT University

Averill Gordon
AUT University

Helen Sissons
AUT University

Andrew Withell
AUT University

O'Reilly coined the term Web 2.0 seven years ago (O'Reilly, 2005), yet in the past seven years we have seen limited evidence of wide-spread impact of Web 2.0 on traditional higher education pedagogy. Seven years on, the social media landscape has changed and today's school-leaving students are entering higher education within an increasingly post Web 2.0 society that is predominantly characterised by engagement with mobile social media. We argue that there is a need for higher education to engage with new pedagogies that are appropriate for an emerging post Web 2.0 society. We present a sustainable framework for preparing lecturers to engage with the challenge of post Web 2.0 pedagogies by experiencing the potential of mobile social media within authentic communities of practice.

Keywords: heutagogy, mlearning, Web 2.0, communities of practice, professional development.

Introduction

The advent of the world wide Web brought about an information revolution (Web 1.0) with the likes of Netscape and Yahoo, while Web 2.0 is characterized by social collaboration and user-customization with the likes of LinkedIn and Facebook. However, Jackson (2012) argues that there will never be a Web 3.0 because the next paradigm shift of the Internet is mobile rather than desktop browser-based. International Telecommunication Union (ITU) November 2011 statistics (International Telecommunication Union, 2011; mobiThinking.com, 2012) show that mobile broadband Internet connections out-number fixed broadband Internet connections by two to one, and 87% of the worlds population have a mobile phone, whereas less than 16% of the worlds population have access to a desktop or laptop computer. ITU statistics also show that in many developing nations, the majority of mobile Web users are mobile-only, with the highest including Egypt at 70 percent and India at 59 percent of Web use via mobile only. Just as the post-modern society emerged out of modernism, we are experiencing a transformation of Web 2.0 into post Web 2.0 mobile social media. This brings the potential to appropriate new pedagogies that harness the potential of mobile social media to create powerful situated, authentic, and informal learning experiences and bridge these into formal learning (Vavoula, 2007).

> As our use of mobile devices, games, and social networks illustrates, information technology can create new experiences. But more important, information technology enables new models. It can disaggregate and decouple products and processes, allowing the creation of new value propositions, value chains, and enterprises. These new models can help higher education serve new groups of students, in greater numbers, and with better learning outcomes. (Oblinger, 2012, p. 11)

However, the challenge is that a shift to the use of mobile Web within education as described by Oblinger (2012) will require two ontological shifts (Cochrane, 2010b, 2012): 1. Re-categorising mobile social media from the domain of informal social interactivity to collaborative tools that enable new pedagogical designs (Kukulska-Hulme, 2010; Laurillard, 2007, 2012), and 2. Re-categorising teaching and learning from teacher-directed pedagogy to enabling student-determined (or negotiated) learning, which has been termed heutagogy

(Blaschke, 2012; Hase & Kenyon, 2000; Luckin et al., 2010). In particular, mobile social media enables student-generated content and student-generated contexts utilizing the affordances of mobile devices, for example using the camera and GPS built into smartphones to display and interact with augmented reality layers created by students (Cochrane & Rhodes, 2011). We use Chi and Hausmann's (2003) definition of ontological shifts:

> An ontological shift is merely the re-assignment or re-categorizing of an instance from one ontological category to another… shifting ontologically may be difficult (if not directly told to do so) for three basic reasons. The first is a lack of the alternative category. The second is the lack of awareness of the need to shift. Finally, the third is that it is resource-intensive. (Chi & Hausmann, 2003, p. 432)

This paper presents a sustainable framework to address the three reasons (according to Chi & Hausmann) that make our two identified ontological shifts difficult: The framework (LTDF) provides alternative categories of pedagogy (from teacher-directed pedagogy to student-directed heutagogy), provides lecturers with an authentic experience of mobile Web 2.0, and provides sustained support for these by embedding these shifts within the activity of supportive communities of practice (COP).

Methodology

The Learning and Teaching Development Fellows (LTDF) builds upon the model of using COP for professional development developed by the researcher as an outcome of a participatory action research methodology (Swantz, 2008), between 2006 and 2010 and summarized in several papers (Cochrane, 2010a; Cochrane, Black, Lee, Narayan, & Verswijvelen, 2012; Cochrane & Narayan, 2011). We have found that one key to pedagogical innovation enabled by technology is developing lecturer competency with the technology (Cochrane, 2010b), creating an awareness of the need for an ontological shift in teaching and learning. Providing a series of short-term professional development workshops is unlikely to provide the support required for these shifts. This then is the goal of establishing and nurturing lecturer COPs, as although this is a resource intense approach, that involves long-term commitments, the results are rewarding. This COP framework was initially developed by the researcher at Unitec, New Zealand's largest Polytechnic, but was then applied to the researcher's new institution, AUT University, New Zealand's newest and fastest growing University. Four examples are provided in this paper. While each COP was unique, a common methodology refined throughout more than 35 mlearning projects was utilized for establishing and nurturing these COPs.

Communities of practice

Our conception of COPs is based upon that developed by Wenger, which began as a social learning theory (Lave & Wenger, 1991; Wenger, 1998), and has been developed as a framework for collaboration enabled by social technologies (Wenger, White, & Smith, 2009; Wenger, White, Smith, & Rowe, 2005). In our LTDF examples, Google Docs was used to collaboratively create and shape the four LTDF proposals around the formation of lecturer COP. These proposals focused upon identifying and supporting teaching fellows with the capability and passion to engage with the two identified ontological shifts. Each teaching fellow then partnered with the researcher to create the core of a COP within their department of lecturers interested in investigating the potential pedagogical impact of mobile social media within their teaching and learning contexts. The LTDF grants were managed by the institution's central support unit CfLAT (the Centre for Learning And Teaching) and provided funds for time-release for the accepted teaching fellows, as well as funds supporting the dissemination of practice-based research. The Teaching fellows then invited 4 to 6 of their peers to form a COP, that would meet regularly (usually weekly), and establish the use of several core mobile social media tools: mobile blogging, Twitter, Google Plus Hangouts, and a range of mobile social media applications.

Each LTDF proposal was also supported by an associated LATENT (Learning And Teaching ENabled by Technology) grant that provided funds for equipment purchases such as iPhones and iPads for use by the lecturers who joined each COP. Each participant was provided with either an iPhone, an iPad, or both for personal and professional use throughout the COP. Those lecturers who committed to participation within the COP for a full academic year were allowed to keep their devices. The mobile devices were not institutionally managed, but were expected to be used as personally-owned devices by the lecturers, thus providing a model for student-owned devices or BYOD (Bring Your Own Device). The LTDF projects therefore provided iPhones for the lecturers participating in the mobile social media COPs that are used to develop their own eportfolios and research relative to integrating the use of mobile Web 2.0 tools in teaching and learning with their students beginning in semester 2 2012. Research-informed experience will enable the course lecturers to not only experience the use of mobile Web 2.0 enhanced teaching and learning, but become confident enough to model the use of these tools within their own courses. Potential outcomes of each project for the participants include:

- Active participation in an authentic COP.
- Research and development of a professional eportfolio.
- Publication and sharing of a peer reviewed research output based upon their experience and the impact on their students.
- Development of new assessment and learning activities enabling student-generated content and student-generated contexts via student-owned mobile devices and Web 2.0 tools.

Four Case Studies: Learning and Teaching Development Fellows 2012

The four LTDF COPs focused upon using mobile social media as a focus for lecturer development, student-generated content, and student-generated learning contexts, or Pedagogy 2.0 (McLoughlin & Lee, 2010) within the contexts of: Journalism, Graphics Design, Product Design, and Public Relations. These are summarized in Table 1, and further described in the following sections.

Table 1: Four LTDF COPs

LTDF Contexts	LATENT Project	Project Blog	COP Participants
Journalism	Reinventing Journalism education via Mobile Social Media	http://ejeteam.wordpress.com	3 lecturers + 1 technology steward
Graphics Design	Heutagogy and Mobile Media Production	http://mopcop.wordpress.com	6 lecturers + 1 technology steward
Product Design	Augmenting the Design Thinking Studio	http://autproductdesign.wordpress.com and http://autdesignjournal.posterous.com/	6 lecturers + 1 technology steward
Public Relations	Communities of Practice in Public Relations	http://icollab12.wordpress.com	3 lecturers + 1 technology steward

Journalism

The Journalism COP was a collaboration with CfLAT to establish a COP based within the Department of Communication Studies at AUT that will establish a group of Lecturer peers and generate collaborative networks both nationally and internationally. This was initially based upon the lecturer's international contacts in the Journalism industry. The COP participants were identified as lecturers who are interested in investigating innovation in teaching and learning using social and mobile technologies within a participatory action research framework. The project built upon the establishment of an initial lecturer COP in collaboration with CfLAT during 2011 (Cochrane, Sissons, & Mulrennan, 2012). Outcomes of this COP are evidenced in the development of several student projects that integrate the use of mobile social media using student-owned devices (smartphones) in Journalism at AUT. The project is supported by an associated LATENT grant project that enables participating lecturers to utilize mobile Web 2.0 tools (for example the iPhone or iPad) in preparation for projects with their students.

The formation of a lecturer COP focused upon mobile social media (in particular Twitter, SMS Polls, and student-generated eportfolios) within Journalism aiming to have the following outcomes:

- Innovation in teaching and learning enabled by technology, in particular a focus upon student-owned devices to enable social constructivist learning environments that engage and empower students, modeling the authentic (Herrington, Herrington, Mantei, Olney, & Ferry, 2009) use of new technologies within Journalism.
- Establishment and development of a Journalism and cross-disciplinary lecturer COP exploring the potential of mobile and social technologies in teaching and learning.
- The COP also explores the affordances of mobile Web 2.0 technologies to enable cost-effective international teams, and remote expert participation, bridging the classroom environment across the

boundaries of time and geography.

- The Journalism lecturer COP builds upon mobile Web 2.0 projects established in 2011 (Cochrane, Sissons, et al., 2012).
- Outcomes of the project will be presented at appropriate peer-reviewed conferences for critical feedback, such as Ascilite2012, MLearn2012, ALT-C2012.

Storifying Journalism
Mobile social media (particularly Twitter and Facebook) have had a huge impact on traditional Journalism (Hirst, 2011; Rusbridger, 2011), but while there has been a big impact on the content of Journalism education, there has been little impact on the pedagogical practices of Journalism education. The default approach to teaching the impact of social media on Journalism has been by written case studies and student-learning assessed by essay writing critiquing these case studies. The LTDF Journalism COP led to reinventing this case study approach to modeling the use of mobile social media in class, and to get students to collate, curate, and critique actual source content around a mobile social media incident in Journalism. Students chose a breaking incident of mobile social media and used Storify.com either on their iPads or laptops to collate and comment upon Twitter, Facebook, YouTube, Instagram, Flickr and other mobile social media, creating an annotated rich-media story of the event or incident. The assignment question became: "How if at all have social media altered the way journalists and public relations practitioners interact? Use real examples from at least three social media platforms as well as academic sources to back up your arguments" (Assessment schedule 2012). This was then either published to their own blog, or their own Storify.com site for their lecturer to mark. Students interacted directly with rich mobile social media, developing creative rich-media stories that required metacognitive critiques. There was a considerably higher level of critique and creativity evidenced in the Storify.com project in comparison to that evidenced in previous essay versions of the assessment. Students used Storify to express and create very personalized critiques of the impact of social media on Journalism. Two contrasting examples are provided: 1. A student used Storify to create a very engaging rich media story that included many elements of humour (http://storify.com/carowells/assessment-1-test), 2. Another student took a more traditional approach to using Storify to enhance an essay, by providing rich media links to the events behind the story, and example contrasting views by experts as video talks (http://storify.com/shawnmoodie/how-if-at-all-have-social-media-altered-the-way-a).

> The best essays made the most of the platform and the freedom to include multimedia examples. These students also altered their style and the way they wrote into the examples to make their essays fit the medium. Further, by using a mixture of books, journal articles and discussions on social media, these students were able to explore the question far more deeply than most of those who stuck to the more traditional format. Initial feedback from students suggests they enjoyed the opportunity to explore social media in a way other that for social purposes. Most also realize the need to be confident using social media for their future role as professional communicators.
> In conclusion we believe the use of Storify in this essay was a success. The question was particularly suited to the use of social media tools. (Lecturer blog post, 2012)

This represented a significant pedagogical shift from the previous traditional written essay approach.

Graphics Design

The graphics design lecturer collaborated with CfLAT to establish a COP of Lecturer peers from the department, as well as establishing collaboration both nationally and internationally (for example: Unitec New Zealand, Salford University UK, and the University of Strasbourg) with other lecturers who are interested in investigating innovation in teaching and learning using social and mobile technologies within an action research framework. The COP links with networks already established as part of the Mobile Innovation Network Aotearoa (MINA, http://mina.pro/) brokering expertise beyond the physical boundaries of the COP. Outcomes of this COP are evidenced in several student projects that cross international boundaries including student mobile video projects presented at international mobile film festivals (for example http://www.mobilefilmfestival.com). The COP builds upon relationships established nationally and internationally in 2011 via the ELVSS11 (http://www.youtube.com/playlist?list=PLB2FFDB84091FD488&feature=mh_lolz) and iCollab11 (http://icollab11.wikispaces.com) projects (Cochrane et al., 2011). The project was supported by an associated LATENT grant project that enabled participating lecturers to utilize mobile Web 2.0 tools (for example the iPhone) in preparation for projects with their students.

The formation of a lecturer COP focused upon mobile media, in particular mobile film making with the following goals:

- Enabling innovation in teaching and learning enabled by technology, in particular a focus upon student-owned devices to enable social constructivist learning environments that link informal and formal learning both locally, nationally and internationally via a virtual international COP.
- Exploring the development of collaborative student-generated mobisodes as digital stories in an international team-based context.
- The COP also explores the affordances of mobile Web 20 technologies to enable cost effective international teams, bridging the boundaries of time and geography.
- The lecturer COP builds upon mobile Web 2.0 projects established in 2011 with Unitec and Salford University, and the MINA project (http://vimeo.com/groups/mobileprojects).

Graphics Design: mobcop12
A lecturer COP was established to explore the potential of mobile social media in graphics design education. The COP was titled mocop12 – mobile COP 2012. Six lecturers were supplied with an iPhone 4S and committed to meeting together weekly to investigate mobile social media. The COP established the use of mobile social media tools for communication and collaboration, including: Twitter, Wordpress, and Google Plus. Those COP members with previous mobile social media experience (including the LTDF fellow and the researcher as a technology steward) created an initial programme of mobile social media tools to investigate:

- Social media overview
- An introduction to Twitter
- An introduction to Blogging
- An introduction to Google Plus Hangouts
- What is RSS – how to manage social media
- Social video via YouTube and Vimeo
- Mobile livestreaming via Bambuser
- Mobile eportfolios via Behance
- Collating and curating mobile social media via Storify.com

Participants wrote an initial mobile social media proposal for implementation with their students in semester two 2012 at the beginning of the COP. This was then rewritten at the end of the first semester after their mobcop12 experience. These project outlines were uploaded and shared as Google Docs and provided a reified reflection activity evidencing significant development of the lecturers' understandings of the affordances of mobile social media for education and pedagogical change. The projects included:

- Creating a short interactive Web documentary using iPhone 4S's to interview members of an orchestra
- Exploring letterpress type development using the iPhone 4S camera and creating an app that can turn captured imagery into vector type
- Exploring mobile film making
- Developing stop frame animation on the iPhone, with project progress reported via student blogs

Product Design

The overall aim of the Product Design Learning and Teaching Fellowship was the formation of a lecturer COP focused upon enabling Design Thinking through the use of social, mobile, Web 2.0 and digital media technologies. The COP provides the lecturers with an authentic experience of the development of a learning community enabled by technology. This will then be implemented and modelled by the lecturers within the course itself.

Specific outcomes include innovation in learning and teaching through:

- The development and exploration of an mlearning infrastructure in the department using contemporary technologies (mobile and Web enabled tools) for lecturers;
- The exploration and use of student-owned mobile and digital media devices to enhance the studio environment that link informal and formal learning beyond the physical studio space. This includes the ability to better capture observations, and reflections in the research and design process, and to better collaborate with other team members in Design Thinking projects;
- The further exploration and application of an online Design Thinking resource in mobile learning

environments, specifically the use of it on mobile, technologies such as laptops, tablets (iPad), and smart phones;

- The exploration and use of student-generated, Web 2.0 enabled e-portfolios in learning environments. This will include the use of Linked In as the 'hub' to integrate a variety of portfolio elements including CV's, project documents (PDF files), photographs (Flickr, Picassa), video (YouTube), and blogs; and
- The exploration of the potential for a 'smart', Web enabled, mobile assessment tool, to be used in the assessment and feedback of Design Thinking project (this is a scoping exercise in the context of the overall project).

The COP spans 2012, and provides time release and support for one lecturer as the coordinator and research partner with CfLAT. In addition LTDF funds were used for reporting the outcomes of the underlying project such as the presentation of papers in the proceedings of a number of international conferences. A COP was established involving the entire Product Design department (including lecturers from the undergraduate, postgraduate Product design programmes, and the Bachelor of Business, Design major, with a total of eight participating lecturers) to investigate and explore innovation in learning and teaching using social, mobile and digital media technologies. The overall goal of the COP was to explore and evaluate the use of contemporary technologies, for example the mobile phone, tablet, Web 2.0 portfolio tools, to 'augment' and enhance constructivist Design Thinking studio environments (both physical and virtual), and to support the learning and teaching process. The technologies will be used in: the delivery and support of teaching, in the process of eportfolio creation, and assessment of Design Thinking projects by students. An informal survey of Product Design students at the end of 2011 indicated the ubiquity of smart phone ownership amongst the students, and this enabled the implementation of innovation in teaching and learning utilising student-owned devices.

Product Design: Busstop moblogging
This student project involved research, analysis and the design of one or more 'product' interventions that clearly improve and enhance the experience of bus patrons (users) in Auckland. The project was undertaken in conjunction with Auckland Transport, a division of the Auckland Council. Students utilized their own smartphones to aid observation and role playing research to identify poor experience ‘touchpoints’ in the Auckland bus journeys. Key to the implementation of mobile social media in the project was the formation of a collaborative blogging platform using Posterous.com and the use of student-owned smartphones to augment the formal studio aspects of the Design Thinking process. Posterous was selected as a good mobile blogging platform because of its clear and simple interface, ease of use, the ability to upload images and text from email, and because it had a good mobile app for smartphones and tablets. In addition to using blogging, students were also asked to undertake some of their research using social media platforms such as Facebook and Twitter surveys to enlist feedback on peoples bus journey experiences, and on the ideas and concepts the students generated through the Design Thinking process.

This project represented a significant conceptual shift on the appropriateness of mobile social media for education by the lecturers. Previously the lecturers had limited their online interaction with students to official institutionally hosted and managed systems such as Blackboard (for course documentation) and Mahara for student eportfolios. Neither of these systems were particularly mobile accessible, and neither were they open to much student customization.

Public Relations

The goal of this LTDF project was to build capacity for innovation in teaching and learning within the Public Relations Department via the establishment and nurturing of a COP of lecturers in partnership with CfLAT. The departmental Teaching and Learning Fellow championed the establishment of this COP and modelled examples of innovative social constructivist practice enabled by technology, leading to transformed teaching practice. An outcome of is COP the further development of two existing global collaborative projects, leading to several student-centered projects within Public Relations courses at AUT, supported by a LATENT grant. This COP builds upon two international collaborative mobile and Web 2.0 projects during 2012: GlobCom (Gordon & Picherit-Duther, 2009), and iCollab12 (Buchem, Cochrane, Gordon, Keegan, & Camacho, 2012). These projects provide authentic collaborative projects for the Public Relations lecturers and students to engage with peers in building international communities, enabled by mobile social media tools. Three key mobile social media tools utilized included: Twitter, Google Plus Hangouts, and Polleverywhere.com. In addition, for one of the projects students experimented with virtual platforms such as Wiggio, Google Docs and Beehive to facilitate team collaboration and share material.

Public relations: Icollab12, students as global mobile social media reporters
The core of the icollab12 project was a COP of lecturers across four countries established in 2011 by the iCollab11 project exploring student-generated digital identity and social media reporting across New Zealand, UK, Spain, and Germany (http://icollab12.wordpress.com/about/). As part of the iCollab12 international project, students in each participating country were required to move beyond the 'classroom' and use their skills in digital communications and social media content production to become transmedia reporters or citizen journalists. The students worked in groups to develop a series of reports for (and in collaboration with) an international audience. The main focus of the project was to produce rich media reports on Social Media in a) their local community, and b) their chosen industry (for example: Web, computing, creative, gigs). Their reports were then presented to students in Germany, Spain and New Zealand – in turn, their fellow iCollab12 students overseas produced parallel content. At the end of the project, students in each country were asked to vote for the best "Social Media" report, and the winners received an iTunes voucher. The following link is to an example YouTube playlist of the final student presentations for iCollab12 project: http://www.youtube.com/playlist?list=PL4C72B10F1B2AC723. For several of the student groups the icollab12 project was a non-assessed project that added an authentic collaborative experience to their course, but did not contribute to their summative assessment. The level of student engagement in this non-assessed project was beyond the expectations of the lecturers. For example, the New Zealand lecturer reflected upon the iCollab12 project:

> The New Zealand AUT University postgraduate students worked enthusiastically on this collaborative project with the students at Salford University in the UK as well as two other groups (Germany and Spain), guided by the researcher as the technology steward. The students presented their projects in class while streaming a live feed via Qik and also posted them on the project collaborative blog to get feedback from these students, and the public at large... This project was not graded but the students were extremely motivated to create what has become a student-led project. (AUT Lecturer, 2012)

Embedding the use of mobile social media within authentic team-based projects led to significantly increased student engagement and creativity.

Discussion

Each of the lecturer COPs utilized a common methodology, as outlined in Table 2. This framework recognizes the uniqueness and creativity of each COP allowing for tailoring the use of mobile social media to each context.

Table 2: Example Product Design COP framework.

mLearning COP Stages	Timeframe	Outcome
Establish weekly COP with lecturers and technology steward. Establish support requirements. Completion of an initial survey that explores participants prior pedagogical beliefs and practice. Establish lecturer eportfolios. Establish a collaborative research agenda and research questions, and establish ethics consent proceedures.	Semester 1	Staff reflect upon their prior pedagogical beliefs and practice. Staff share their current course outlines and assessment strategies for collaborative editing via Google Docs. Staff develop competency with mlearning. Staff explore mlearning pedagogies. Staff develop pedagogical mlearning activities based on social constructivist pedagogies
Mlearning projects with staff and students. Implementation of the mlearning activities within each course and assessment.	Semester 2	Students establish mlearning eportfolios. Increased student engagement. Flexible delivery. Facilitating social constructivist pedagogies and bridging learning contexts.
Lecturers publish and present case studies based on project implementation, these then inform the design of the following iteration of the project.	End of Semester 2 and beginning of following Semester	Collaborative research writing based on prior and redeveloped course outlines and outcomes via Google Docs.

The reified activity of the COPs established around the LTDF's have been used to broker the impact on student learning by showcasing student projects coming out of these COPs. These have provided tangible examples of post Web 2.0 pedagogy in action. Thus far the examples have come from the practice of the LTDF's, as they establish COPs of their colleagues, and have begun the process of drawing them in from the periphery of post Web 2.0 practice into full participation within these COPs. Typically this involves a process of initial personal appropriation of the affordances of mobile social media for increasing lecturer productivity. This is then followed by an investigation of the pedagogical potential of these tools, and finally by an investigation of how these tools enable new pedagogies and the design of learning activities and assessments that focus upon student-generated content and student-generated contexts.

The LTDF lecturer COPs intersect with a variety of other COPs, including:

- Each student course cohort
- The four lecturer COPs a part of a wider LTDF COP made up of the four Teaching Fellows and the technology steward
- Individual course projects

This framework addresses the three issues confronting ontological shifts (Chi & Hausmann, 2003): The first is a lack of the alternative category, addressed by reframing pedagogy from teacher-directed to enabling student-generated content and student-generated contexts (heutagogy). The second is the lack of awareness of the need to shift, addressed by building a COP that provides authentic experiences while building a culture of trust. Finally, the third is that it is resource-intensive, addressed by providing sustained pedagogical and technical support throughout the projects. Addressing these three issues provides the foundation for significant pedagogical change based upon sustained engagement, enabling an ontological shift from teacher-directed pedagogy to student-directed heutagogy, as illustrated in figure 1.

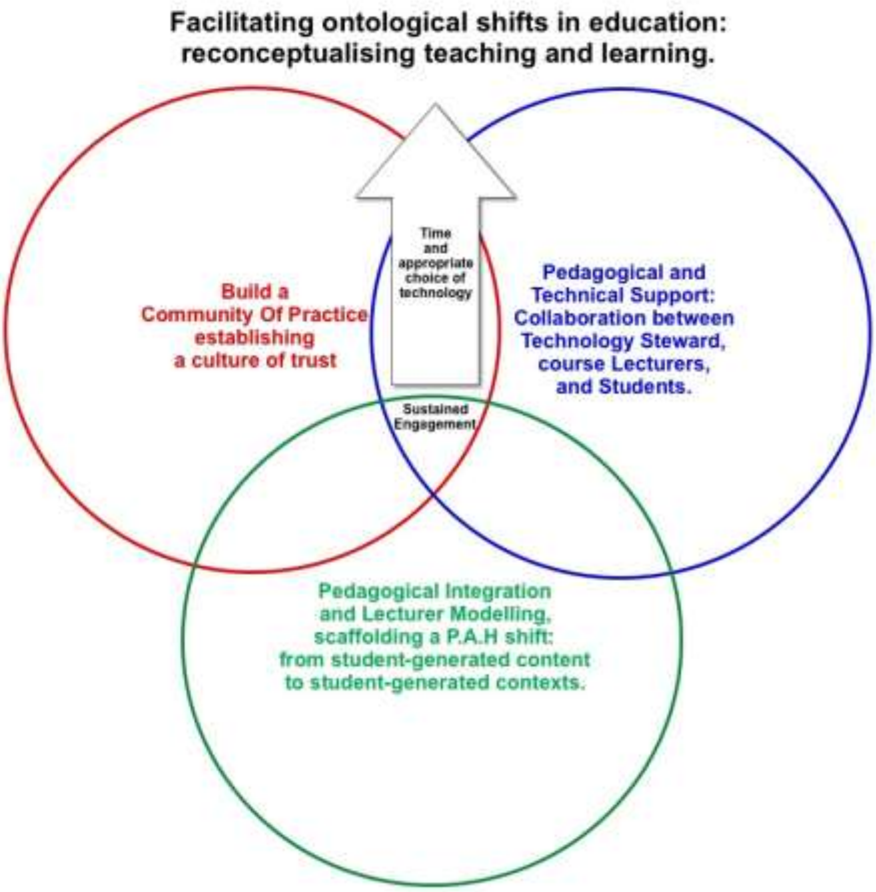

Figure 1: Nurturing ontological shifts leading to heutagogy.

In Figure 1 we use Luckin et al.'s (2010) concept of the Pedagogy-Andragogy-Heutagogy (P.A.H) continuum as a measure of pedagogical change as the projects evidence shifts along this continuum from teacher-directed (pedagogy) to student-directed (heutagogy). The examples, one from each LTDF COP, illustrate the use of mobile social media in education to enable shifts from teacher-directed pedagogy to student-generated content and student-generated contexts within the four LTDF course contexts. In each of these projects the LTDF fellows engaged in modeling the use of mobile social media tools alongside their students and colleagues.

Next steps

The next step in developing this framework will be evaluating it's impact within the four contexts outlined during 2012 and beyond, and continuing to bring other lecturers from the periphery of these COPs into full participation within new COPs in other departments. We have begun to do this by celebrating and showcasing the innovative and creative work that students have created as outcomes of these four COPs. This has taken the form of symposiums and published research outputs by the participating lecturers based upon reflective teaching practice informed by the framework (Cochrane, Antonczak, & Wagner, 2012; Cochrane, et al., 2011; Cochrane, Sissons, et al., 2012; Withell, Cochrane, Reay, Gaziulusoy, & Inder, 2012). An analysis and review of the impact of the LTDF model at the end of 2012 will be used to compare the institutional impact of this model in comparison to the previous model of just-in-time lecturer support combined with the delivery of a series of professional development workshops for lecturers. Initial results indicate that the LTDF model is providing significantly more support for innovation and pedagogical change than the previous institutional support model, and thus institutional funding for the LTDF model is likely to continue.

Conclusion

We have a presented a framework for preparing lecturers to engage with the challenge of post Web 2.0 pedagogies by experiencing the potential of mobile social media within authentic communities of practice. These COPs use mobile social media as catalysts for redesigning learning activities and assessments around student-generated content and student-generated contexts. We have also provided examples of resultant projects that utilize these new pedagogical approaches focusing upon learning for the future of post Web 2.0 or mobile social media. The institutional sustainability of this LTDF framework will be evaluated at the end of 2012.

AUT University

Thomas Cochrane BE, BD, GDHE, MTS, Mcomp, PHD (Monash), is an Academic Advisor and Senior Lecturer in educational Technology at AUT University's Centre for Learning and Teaching (CfLAT). He was recently awarded as an AsciliteFellow. His research interests include mobile learning, web 2.0, and communities of practice. Thomas has managed and implemented over 35 mobile learning projects, with a recent focus upon Android and iOS smartphones and the iPad as catalysts to enable student-generated content and student-generated learning contexts, bridging formal and informal learning environments.

Helen Sissons
Senior Lecturer, Journalism
AUT University

Helen Sissons, MA (Distinction, Columbia University, New York), BSc, NCTJ, CTLHE is a Senior Lecturer of journalism at Auckland University of Technology (AUT), New Zealand. She is the author of *Practical Journalism: How to Write News*. Her current research interests are the relationship between public relations and journalism, the future of journalism and the teaching of journalism.

Laurent Antonczak
Senior Lecturer, Department or Centre: Design
AUT University

Laurent Antonczak (DESS Images de Synthèse Appliquées à la Communication) is a specialist in digital strategies and emerging technologies (web & mobile phones). He is currently leading a research project exploring the use of mobile technology into a pedagogical environment in partnership with Cflat and Thom Cochrane. Laurent lectures and supervises (mainly postgraduate) students in New Media & Visual Communication at AUT University and he is a research group coordinator at CoLab – AUT University's 'MoTec: Mobile Technologies' unit (www.colab.org.nz). Laurent is also one of the co-founders of MINA [Mobile Innovation Network Aotearoa], (www.mina.pro) and a partner in VIRTUO (www.virtuo.co.nz).

Averill Gordon
Senior Lecturer, Public Relations
AUT University

Averill Gordon MA, PGCHE, BA, MCIPR is a senior lecturer in public relations at Auckland University of Technology (AUT). She is the author of the textbook *Public Relations* published by Oxford University Press that applies theory to practice. Her research focuses on mobile learning and leadership patterns in global virtual teams that builds on her professional career where she directed international public relations accounts for a global PR agency based in London. She is also the global team mentor for Globcom, a network of universities around the world where each year students work in global virtual teams answering a live brief for an international client.

Andrew Withell
Senior Lecturer, Product Design
AUT University

Brief biography (include qualifications) (max 100 words): Andrew has an MFA in Industrial Design from the University of Illinois at Urbana/Champaign, USA. He is currently HOD, Product Design, and Discipline Chair of the Bachelor of Business, Design major in the School of Art and Design. Andrew is currently a PhD candidate, and his research focuses on the development of Design Thinking expertise in higher education. In conjunction with his PhD studies, Andrew is also researching the role of mobile social media technologies in augmenting and enhancing the physical Design Thinking studio. Andrew has published a number of papers on Design Thinking education.

David Rhodes
Academic Advisor, Te Puna Ako
Unitec

David Rhodes is a Senior Lecturer and Academic Advisor in eLearning at Te Puna Ako, Unitec's Academic Directorate. His research interests include technology and the Arts, workplace eLearning integration, rich media ePublishing, and mobile learning. David manages and supports a team of eLearning experts across a range of disciplines, but is most passionate about Interactive and New Media Arts. He has lectured extensively in the fields of Visual Communication, Animation, Design Engineering, and Publishing. He has participated in a number of student focused international collaborations.

Daniel Wagner
Senior Lecturer, Performing and Screen Arts
Unitec

Daniel Wagner, BA (Responsible Telecommunications, Antioch University, Los Angeles), GCertHE (Unitec, NZ) has been involved in creating television for social change; has been a radio News & Public Affairs Director; has directed music videos, beginning two years before MTV; and has 25 years of Camera Department experience in the LA motion picture industry. He's now a Senior Lecturer in Cinematography and Emerging Technologies at Unitec in Auckland, and is the e-Learning Community Coordinator for the Department of Performing and Screen Arts there. His research interests are the transformations of approach, methodology, function and sensibility between the world of Film and that of New Media.

Ilona Buchem
Professor Digital Media Studies
Beuth University

Prof. Dr. Ilona Buchem is visiting professor in Digital Media Studies at Beuth University of Applied Sciences Berlin. Her teaching and research focuses on the ways that new digital media, most notably social and mobile media, change socio-cultural practises including learning and education, organisational communication and citizen participation. Ilona Buchem will account for the iCollab12 experience from the viewpoint of German students at the university of applied sciences and the gender perspective.

Mar Camacho
Departament de Pedagogia
Universitat Rovira i Virgili

PhD in Educational Technology. Senior lecturer at the School of Education at Universitat Rovira i Virgili. Author of several publications regarding the use of ICT in teaching and learning processes, her latest research streamlines have been centered on the use and implementation of mobile learning and emerging technologies as tools which help us transform, enrich and extend the learning experience. Her latest research projects concern the transformation of educational methodologies with ICT, the integration of Mobile Learning into teaching and learning processes and the use of other emergent technologies such as simulations and gaming. In the last years she has actively participated in seminars, round tables and conferences around the world.

Helen Keegan
Senior Lecturer, Professional Sound and Video Technology
Salford University

Brief biography (include qualifications) (max 100 words): Helen Keegan, BA (Hons), PGCert, is Senior Lecturer at the University of Salford, MediaCityUK, where she plays a leading role in curriculum/pedagogic innovation, focusing on creativity and interdisciplinarity. Her research focuses on digital culture/identity/literacy, and the interplay between formal and informal learning. She has been recognised by JISC as one of 10 institutional innovators in UK Higher Education, by ALT-Epigeum for her effective use of video in education, and in July 2011 she was awarded the Vice Chancellor's Distinguished Teaching Award in recognition of distinguished achievement in teaching and support of student learning at the University of Salford.

Solène Troussé
Part-time Lecturer Visual Arts – Multimedia
Strasbourg University

Solène Troussé is a part-time Lecturer at the University of Strasbourg, where she teaches video , motion graphics and graphic design. She specialised also in e-learning and mobile video production as well as experimentation as an international participatory project. Solène works aside university as motion graphics freelancer for various clients and she is one of the key collaborator at Virtuo (http://virtuo.co.nz/). Last year she was strongly involved with "Shoot me now 2011" an international co-creation project led by Laurent Antonczak, Max Schleser and Anna Jackson.

Outline of focus area and summary of ideas to be explored

Mobile Internet connectivity has outgrown desktop and laptop Internet connectivity (MobileFuture, 2010). Mobile social media has become the successor to web 2.0 (Brown-Martin, 2010; Cheney, 2010; Jackson, 2012; Ryan, 2011). We will discuss examples of how higher education can harness the potential of mobile social media (McLoughlin & Lee, 2010), with reference to four projects that represent significant pedagogical change within eight different course contexts (including four courses in Spain, Germany, France, and UK):

- The use of mobile social media in Journalism (Cochrane, Sissons, & Mulrennan, 2012)
- The ELVSS12 project that established international student teams for co-production of mobile movies (http://elvss2012.wordpress.com)
- The use of mobile social media for enhancing a physical studio-based Product Design course (http://autdesignjournal.posterous.com/)
- The iCollab12 international project that featured student teams in four countries (NZ, UK, Spain, Germany) becoming social media reporters (Buchem, Cochrane, Gordon, Keegan, & Camacho, 2012; Cochrane, et al., 2011)

The symposium presenters will discuss issues relating to ethics, privacy, student engagement and the new pedagogical strategies they used to facilitate and design student-directed learning experiences or heutagogy (Blaschke, 2012; Hase & Kenyon, 2000; Luckin, et al., 2010) within their courses. A key strategy has been embedding these projects within the establishment of communities of practice (Lave & Wenger, 1991; Wenger, 1998; Wenger, McDermott, & Snyder, 2002; Wenger, White, Smith, & Rowe, 2005), both local and international. Student-generated projects have provided reified artifacts from these communities of practice. Key tools such as Google Plus Hangouts will be used during the Symposium to demonstrate how mobile social media was integrated into these projects. Examples of student projects created as a result of these projects will also be demonstrated and critiqued. Discussion with the audience will include an invitation for participation in future national and international mobile social media projects, with a particular focus upon enabling authentic collaborative experiences for students.

Range of views that panel members will represent

The panel members represent four mobile social media projects that have leveraged student-generated mobile media and student-negotiated teams. Two of these projects are locally based within the institution, while the other two are part of international collaborations with five countries including: NZ, UK, France, Germany, Spain. Thus views include facilitating collaboration across cultural, language, geographical and timezone differences.

Intended audience

The general audience for the symposium will be academics interested in exploring: new pedagogies, social and mobile media, and student-generated content and contexts for learning.

Outline of the symposium format, including strategies that will be used to engage the audience

A live Google Plus Hangout will connect the NZ panel with International members of the projects in the UK, Berlin, and Spain. The Hangout will be broadcast live with the URL publicized for anyone to view, and the Hangout will also be archived on YouTube for later asynchronous viewing and commenting. A Twitter hashtag will be used for collating feedback and live interaction, and a Twitter stream will be displayed throughout the symposium. Participants will also have access to a Wikispaces wiki discussion for collating ideas and a page will be created providing links to all the examples presented. Examples of student-generated projects resulting from the investigation of new pedagogies for mobile social media use in higher education will be demoed and critiqued. Participants will be encouraged to use a range of mobile social media throughout the symposium (for example: Twitter, Instagram, Flickr, YouTube, Facebook), and these social media artifacts will then be collated/curated by the panel at the end of the symposium via Storify.com, reifying the activity of the symposium and providing an authentic mobile social media record of the symposium.

University of New South Wales

This poster presents a series of UNSW LTU seed funding grants that explored a program-wide approach to using ePortfolios as a reflective learning process together with the need for life-long and life-wide learning alongside career goal setting. ePortfolios were selected as the learning technology for these studies as they provide a cohesive and reflective space to enable a student to reflect upon and understand different ways of operating and possible new directions for their learning. In higher education more recently, there has been a growing imperative to have a portable record of work undertaken across a number of areas of endeavor in a student's academic life for assurance of learning. A Mahara ePortfolio serves several important functions with this in mind; it allows for integration of reflective elements, in the Journal, with career-oriented elements, including the articulation of academic and personal skills, plans and the Resume; it records past and current practice for reflecting upon practice to effect change, and acts as a change agent by enabling long-term on-going evaluation of student performance and associated learning outcomes.

Keywords: ePortfolios; Mahara; reflection; reflective practice; medical science; advanced science; higher education; careers.

Newman & Wehlage (1993) identified five key standards or benchmarks that support the development of deeper learning when designing curriculum for student learning:

- Higher order thinking;
- Depth of knowledge;
- Connectedness to the real world;
- Encouragement of substantive conversation between students and between students and_their teachers, and;
- Social support for student achievement.

This approach to implementation in Medical Science and Advanced Science core courses includes these key standards of Newman & Wehlage alongside self-awareness and career development learning (Stanbury, 2005) to make explicit to students the relevance of the ePortfolio for their current studies and future careers. The connectedness to the real world includes authentic learning and assessment in the course and after graduation when the ePortfolio can play a role that supports the ‘practice’ of skills (Brown, 2003) in the workplace.

Building Professional Skills and Career Readiness in the Sciences

These pilot projects in their individual courses in Medical Science and Advanced Science use an ePortfolio to develop self-awareness in relation to course content through reflection and career goal setting. Beyond a single course, the project seeks to build professional skills and career readiness in the sciences on a wider program level. This we believe will provide a platform for holistic development and assessment of a range of graduate capabilities both academically and socially, while helping to support and develop student’s self and career awareness, readiness and graduate employability. This pilot involves approximately 510 students across selected Science, Advanced Science and Medical Science courses.

Life long and life wide learning

ePortfolios enable both a self-directed and an individualized approach to learning that can promote life-long capabilities and can enhance students’ professional preparedness in science by approaching the learning experiences through an orientation of process rather than product. As these students engage in reflection upon the relationships between their educational experiences, in each of the courses, they are developing both personal and professional future career aspirations, aptitudes, and opportunities. As students develop the appropriate skills to self regulate their learning and become responsible for their learning, they can engage both individually and collaboratively in the ePortfolio. This highlights and makes clear the interrelatedness of learning processes, knowledge and skills that the students gain across a degree program.

The fundamental outcomes of using ePortfolios can be summarised as follows. Students are encouraged to collect, select, reflect and connect. *When developing personal ePortfolios* students are supported to develop skills that enable them to:

- self regulate learning and become responsible for their learning beyond the walls of the classroom; and,
- engage both individually and collaboratively using ePortfolio.

In this setting, students learn to critically review the work of others and gain an insight into the varying qualities and standards of work in the course. This also helps students to identify quality in their own work and that of their colleagues as they develop an understanding for the standard required.

Career development learning and ePortfolios in the Sciences

Career development learning (CDL) is a process that “empowers individuals to identify, develop and articulate the skills, qualifications, experiences, attributes and knowledge that will enable them to make an effective transition into their chosen futures, and manage their careers as lifelong learners, with a realistic and positive attitude” (Stanbury, 2005). It is both a transdisciplinary process and a subject discipline with its own history, evidence base, theoretical frameworks and methodologies.

The goal of career development learning is to help students to acquire knowledge, concepts, skills and attitudes which will equip them to manage their careers, their life-long progression in learning and work (Watts 2006). Reinforcing the intention of this outcome, the Bradley review for the Australian Government listed an expectation that higher education should “produce graduates with the knowledge, skills and understandings for full participation in society and the economy.”

Although there are different theories and developmental approaches to careers education, the most widely used framework by career centres around the world is the DOTS model. The basic assumption underpinning this model is that effective career learning is composed of a dynamic relationship between Self, Opportunities, Decisions and Transitions (DOTS) (Watts, 2006). These four elements involve:

- self-awareness - the ability to identify and articulate motivations, skills, and personality as they affect career plans;
- opportunity awareness - knowledge of opportunities and the ability to research these;
- decision making - being able to weigh up personal factors to make a sound plan, and;
- transition learning - understanding of how to seek and secure employment opportunities.

Discussion and Conclusion

This poster presents how this project has arisen through the combined interests of educators and career advisors. Together we have identified opportunities to address the UNSW Graduate Capabilities through the introduction of ePortfolios. This study is appropriately staged such that graduates should develop career pathway awareness, begin to reflect on the transferable and technical skills acquired throughout their undergraduate studies and address any weakness that might hinder their ability to achieve their career target. Together, these elements can help fortify student career awareness by encouraging students to consider their work interest areas, career paths and decisions, employment opportunities and attitude for career success. Students also learn to consider what recruiters are seeking and strategically devise a plan to achieve their career goals.

It is not enough, in times of evidence-based education practices, for students to simply claim, at the end of their programs of study, that they have achieved capabilities of Scholarship, Leadership, Professionalism and Global Citizenry. They are now required to substantiate such claims with clear records of achievement. EPortfolios offer students the perfect opportunity to both record and enhance their professional skills and tailor them to the workforce in which they will practice. Further it will enable the University to warrant the claims of its Graduate Capabilities through the students' own acknowledgements of achievement. It further seeks to explore the often-tenuous relationship in higher education between the 'hard' and 'soft skills' where careers and employment, learning and teaching unit, teaching academics and science researchers have developed a project with the principal aim:
That by providing a portfolio platform and digital repository for holistic development and assessment of a range of graduate capabilities both academically and socially student's career awareness, readiness and graduate employability can be enhanced and improved.

If we build it, will they come?
Developing an online assessment resource for educators at UNSW

Kathryn Coleman
Learning and Teaching Unit
University of New South Wales

Adele Flood
Learning and Teaching Unit
University of New South Wales

Through the Assessment AS Learning Toolkit, on the new Teaching Gateway at University of New South Wales (UNSW) educators and academics have the opportunity to find ideas, guidelines, and practical strategies on the holistic processes of designing online assessment as learning. This toolkit has been devised to collect and share resources and includes practical strategies for selecting technologies that suit the learning objectives and outcomes of courses and programs to support more effective and efficient assessment. The premise throughout this Toolkit is that assessment should focus primarily on learning and the achievement of intended learning outcomes. This poster seeks to showcase the range of online assessment practices being used at UNSW to enhance student learning.

Keywords: Technologies for assessment; professional development; blended learning; online assessment.

Building a Toolkit

In this poster we describe our experiences of developing this online resource for teaching staff as UNSW developed new strategies for assessment AS learning (See Figure 1). The online resources developed have been designed to provide support in selecting assessment with practical strategies on the holistic processes of designing online assessment while also providing discipline specific resources that focus on faculty experience. The Toolkit has included the building of professional development resources for staff and to enable them to share their own practice though short videos and video case studies and scenario video clips in situ.

Figure 1: UNSW Assessment AS Learning Toolkit

Why develop an online assessment resource for educators at UNSW?

It was found that many academics at UNSW were keen to develop more innovative and student focused assessment however, they were often in need of assistance to undertake such changes. At the same time there were others who were willing to share with their colleagues during seminars and workshops how they were integrating technology and introducing varied assessment techniques into their assessment practices. A common request was "Will you be recording this? Can I get a copy?" Concurrently with this, as well the creation of a new Teaching Gateway, the Vice Chancellor instigated a University wide review of assessment seeking to make assessment more efficient and effective. It was decided that the best way to harness the resources that were available within our own academic staff to support such changes to practice would be to develop a toolkit (modeled on Macquarie University's toolkit) of resources fully available online to those teaching both within and beyond the University.

Selecting Technologies for Assessment

This poster focuses on the technologies for assessment resource to support technology in assessment processes.

To support educators, the toolkit offers strategies and benefits of utilising technology (See Figure 2) for assessment to help learners engage more productively and flexibly in their course learning and assessment, and can help staff manage assessment more efficiently and effectively. The Toolkit resource seeks to promote how learning can be more flexible when students can choose when and where they access content and engage in learning and assessment online. This flexibility helps students to regulate their own learning and play a role in the process. Using tools such as discussion forums and wikis, educators can record student group processes and support students more flexibly as they progress through assessment tasks. This support and ownership can aid in developing a more student-centred approach to learning and assessment and provide students with a space to learn, reflect and develop connections between knowledge ideas.

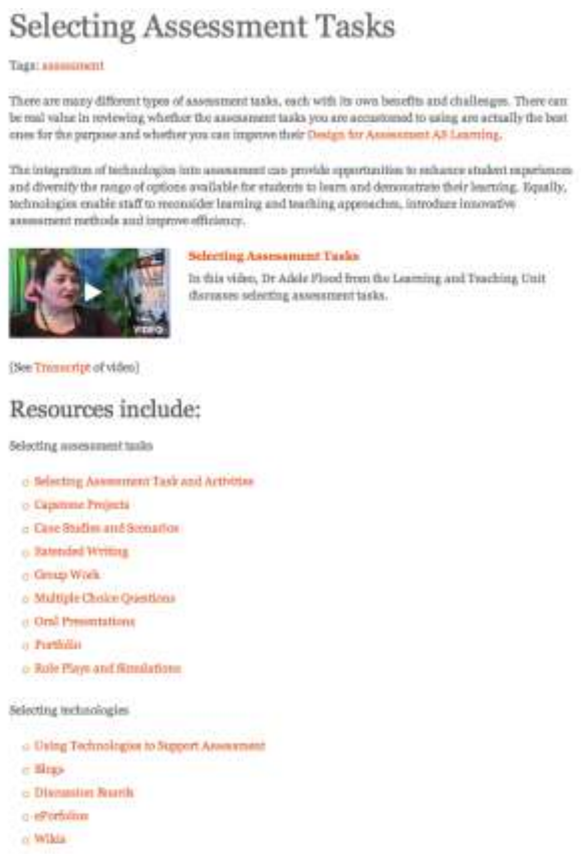

Figure 2: Selecting Assessment tasks

In many cases, technology-improved efficiencies in managing assessment also benefit students educationally. For example, providing online multiple-choice quizzes with automated marking and feedback may ultimately reduce staff marking loads, as well as giving students immediate feedback on their learning performance. Other strategies from the Toolkit suggest how blending technologies with face-to-face teaching, learning and assessment can:

- enable online submission of assignments.
- enhance students' assessment-as-learning experiences.
- give students more ways to learn and to demonstrate their learning.
- enable staff to reconsider learning and teaching approaches.
- introduce innovative assessment methods
- help staff give timely and more comprehensive feedback, and
- improve teachers' efficiency in managing large volumes of marking and administration.
- support a students' learning process, through automated assignment receipts, and marking and feedback records.
- support students as they develop graduate capability skills such as communicaton, global citizenship and professional skills (eportfolio).

Have they come?

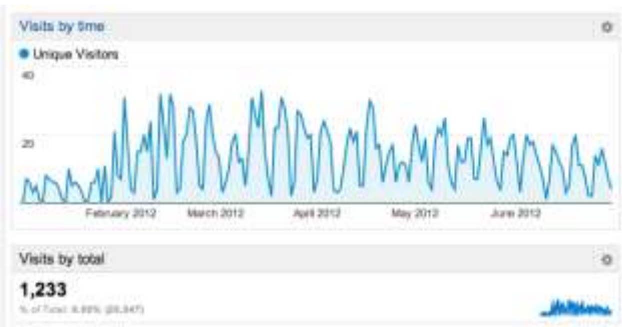

Figure 3: Jan-July 2012 Analytics from Google Analytics

The overall satisfaction of the analytics (see Figure 3) on the Toolkit pages have suggested that 1233 unique visitors in Sydney using the identifier ‘assess’ have accessed the Online assessment Toolkit in the last 6 months. This suggests that we have more work to do in delivering the content to faculty, however, as the Internet enables the views from outside users and externals is currently on the rise we assume that content as a professional development resource is valid and required in the field.

Will they keep coming?

The Assessment Toolkit will continue to be analysed, built upon and presented to faculty. It will also continue to be developed to present how emerging technologies can enable assessment and learning to develop digitally literate 21st century citizens. It will also continue to provide a world-class set of resources available to anyone wishing to enhance their own assessment practice within a global audience.

Researching around the world: Developing an International Reference Group for ePortfolios in Higher Education

Kathryn Coleman
Deakin Learning Futures
Deakin University

Judy Williamson Batson
Vice-President
AAEEBL

Trent Batson
President/CEO
AAEEBL

Nan Travers
Director of the Office of College-wide Academic Review
Empire State College

This poster presents the newly developed International Reference Group (IRG) for eportfolios in Higher Education as part of the work by The Association for Authentic, Experiential and Evidence-Based Learning (AAEEBL) 2012 Research Committee. The purpose of the poster is to highlight this initiative, to share the AAEEBL mission, and to recruit interested individuals to join the IRG. AAEEBL is the international professional association for the eportfolio community with the mission to develop learners and to transform institutions with eportfolios. AAEEBL seeks to accomplish this by serving the global eportfolio community as a non-profit, service organization that offers membership benefits to institutional members and opportunities to corporates to share practices, research and industry developments supporting eportfolio implementation.

Keywords: eportfolio; International Research Group; research; higher education; AAEEBL

ePortfolios as a catalyst for connections

ePortfolio community leaders recognized in 2008 that eportfolios, as a technology, and as a body of theory and of practice, had emerged as a promising influence and direction for education. As such, the eportfolio movement needed its own professional association to catalyze the implementation of eportfolios in education. AAEEBL deeply believes in the value of eportfolios for assessment as learning, life-long and life wide career success and professional readiness. Members of the global eportfolio community formed AAEEBL in 2009 to serve educators and learners in order to address the growing need to underscore advances in knowledge about eportfolio use and to recognize the emergence of eportfolios as a field of specialized research and practice. AAEEBL promotes authentic, experiential and evidence-based learning for an international community of eportfolio users, researchers and educators.

As the recent research of Oliver (2008, 2010) and Oliver and Whelan (2011) suggests, the relevance to higher education student learning in providing evidence for graduate employability is becoming increasingly warranted. As Oliver et al. (2009) indicated, eportfolios are “an interface for collecting and sharing evidence of learning and professional development” and demonstrate “recognition that learning happens both within and beyond the formal classroom” (p.1). This growing importance of demonstrating graduate capabilities and competencies necessitates a revision of traditional assessment practice. The emergence of technologies to support eportfolios allows not only the aggregating of material in a wide range of formats, but also the embedding of peer review and selective sharing via social networks. While the potential of eportfolios has been recognized for over a decade, eportfolios as a catalyst for research connections still needs further development.

Penny-Light, Chen and Ittelson (2012) delineate an eportfolio implementation framework that they describe as “an iterative process” (1). It is significant that a number of the eight critical issues they identify in this process include attention to a variety of research-related activities: 1.) Defining learning outcomes; 2.) Understanding your learners; 3.) Identifying stakeholders; 4.) Designing learning activities; 5.) Using rubrics to evaluate eportfolios; 6.) Anticipating external uses of evidence; 7.) Including multiple forms of evidence; and 8.) Evaluating the impact of eportfolios.

This poster presents AAEEBL's mission to develop learners and transform institutions with electronic portfolios alongside its desire to establish an International Reference Group (IRG) of researchers. AAEEBL is a service organization that offers conferences, resources, community connections, a newsletter, and consulting to institutional members and corporate affiliates.

If we build it – will you come?

With affiliations and collaborations among a wide array of worldwide eportfolio initiatives, projects and organizations, AAEEBL helps delineate the new field of eportfolio scholarship and research. Its offices are located in North Kingstown, Rhode Island, USA. A Board of Directors oversees AAEEBL's activities and serves as a governing board. Members of this board include prominent leaders in the field of eportfolio implementation, publication and research. The development of an International Research and Reference Group aims to provide integrated knowledge and strategic advice on future research investments, including in the areas of education and higher education, professional development and collaborative activities.

Future directions - Developing an International Research Group

The mission of the IRG is to establish collegial connections and to disseminate educational research while developing international collaborations on research projects. The IRG aims to have impact by encouraging effective and innovative models of partnership through joint research, conferences, and publications, which will be shared locally, nationally and internationally.

ePortfolio conceptions vary from country to country. Likewise, sources for support to implement eportfolios vary from country to country with full governmental funding available in some instances and the barest of institutional funding provided elsewhere. Therefore evidence gathered from eportfolio research and assessment data is often uneven and lacks meaningful synthesis upon which to "close the loop" as Clemson University's Gail Ring (2012) suggests in order to "share assessment data in ways that significantly improve learning outcomes."

In the USA, eportfolios are employed in several ways, the most prevalent being for: career/showcase; assessment; learning; and advisement according to a report compiled by the Connect to Learning Project (C2L Leadership Team, 2012). Other widespread emerging uses for eportfolios in the US include professional accreditation and institutional credentialing. The focus is therefore primarily on learning and assessments with a developing focus on employability.

In the UK, eportfolios are seen as "recording achievement," demonstrating learning, workforce development, with an incipient focus on learning.

In Europe, eportfolios have little traction except as the Bologna process tries to align certification across the members of the EU: What does a college degree mean in France as compared to the Netherlands?

In Australia, eportfolios are seen as both reflective and life long learning spaces. They are used in courses and programs to enable students to reflect on their learning, performance and /or achievement in both formative and summative assessment, while encouraging independent learning. They also serve for students to present evidence of achieving program outcomes through artifacts that demonstrate transferable skills in capstone courses and programs that require professional accreditation.

To connect these international foci, The AAEEBL-facilitated IRG will encourage innovative approaches to eportfolio assessment and evaluation in training, education, professional development and research-focused activities. The IRG aims to develop a coalition of international, regional and national eportfolio bodies whose members contribute in sharing eportfolio research findings and thus widening the field of eportfolio implementation and investigation. The IRG will keep abreast of changes and innovations in eportfolio research and share these updates. Sites for sharing include international, national and regional conferences and webinars, the new publication, *International Journal of ePortfolio*, a variety of social media, and the creation of a collaborative online repository for research findings and discussion. AAEEBL's bi-monthly newsletter, *The AAEEBL Learner*, will dedicate space for highlighting resources and for sharing write-ups about research initiatives and upcoming events that seek to explore how international eportfolio research can be shared more widely in the community.

How to get involved: Expressions of Interest for the IRG are to be addressed to the authors. For information about joining AAEEBL, contact Judy Williamson Batson (judybatson@me.com).

The 7 Cs of learning design

Gráinne Conole
Professor, Beyond Distance Research Alliance
University of Leicester

Gráinne Conole is Professor of learning innovation at Leicester University. Her research interests include the use, integration and evaluation of technologies and their impact on organisational change. Two of her interests are learning design and Open Educational Resources. She serves on and chairs a number of national and international advisory boards, steering groups, committees and international conference programmes. She has published and presented nearly 1000 conference proceedings, workshops and articles and keeps a blog www.e4innovation.com. She has a PhD in X-Ray Crystallography. She is author of a new Springer entitled: 'Designing for learning in an open world'.

Intended audience and degree of expertise/past experience required

The workshop will be of interest to academics and support staff with an interest in exploring how to use technologies more effectively in learning.

Statement of objectives for the workshop

By the end of this module, participants will be able to:

- conceptualise the learning design process from different perspectives
- apply a range of learning design resources, tools and methods to a learning intervention
- critique a range of pedagogical approaches and the role played by different technologies in supporting these
- review and debate the theoretical underpinnings of learning design
- develop an innovative storyboard, learning activities and a structure for implementation.

Detailed description

The participants will engage with a range of learning design conceptual tools and a social networking site for sharing and discussing learning and teaching ideas. They will work in groups and will periodically share back their discussions with the rest of the participants. Artefacts produced will be captured and made available online. Activities will include the following:

- How to ruin a course
- Course map view
- Activity profile
- Course dimensions view
- Task swimlane view
- Learning outcomes map
- Affordances of technologies
- Mapping pedagogies to technologies
- Harnessing social media for dissemination and communication
- Exploring pedagogical patterns to promote collaborative learning

The activities are part of the 7Cs of learning design framework that we have developed which consists of seven components:

- Conceptualise – which initiates the design process and consists of imagine, design and prepare.
- Capture – which covers the ways in which search engines, OER repositories and social bookmarking can be used to find and collate relevant resources and activities.
- Create – which covers both the creation of content and activities.
- Communicate – which covers how to moderate asynchronous and synchronous forums
- Collaborate – which considers how tools like wikis, voicethread, pirate pad can be used to foster collaboration and how to work in virtual teams.
- Consider – which covers the ways in which tools such as blogs, e-portfolios and Multiple Choice Questions

(MCQs) can be used to promote reflection and different forms of assessment.

See http://e4innovation.com/?p=576 for more detail. This work is described in more detail in a forthcoming book (Conole, 2012).

Moodle Workshop activities support peer review in Year 1 Science: present and future

Julian M Cox
Faculty of Science
The University of New South Wales

John Paul Posada
Faculty of Engineering
The University of New South Wales

Russell Waldron
Faculty of Engineering
The University of New South Wales

Compulsory Science Faculty (SCIF) courses in various programs of study serve to provide students with a sense of belonging within their own cohort and with their professional future, as well as developing a range of skills relevant to that future. These aims are supported through completion of assessment tasks, which in turn are supported through the use of the Moodle learning management system. Specifically, the Workshop tool facilitates the practice of peer review, one of the processes in the course not only relevant to professional practice in the sciences but supporting active learning among students through noticing aspects of a range of tasks in which they can improve. This paper describes the use of the Workshop tool in its original form as well as modifications developed at the University of New South Wales (UNSW) to support the use of peer review and assessment processes associated with a range of assessment tasks.

Keywords: Moodle, peer review, active learning, workshop, marking

Peer review in education and the profession

The importance of peer review in professional life is beyond question. It pervades all areas of endeavour, within, as most relevant to the current study, the sciences, including research (presentation, publication, grant proposals), and teaching (peer observation). Its many and profound benefits in education in, for example, the biosciences, have been highlighted (Orsmond 2004). The use of peer review and assessment in an increasing range of settings is rapidly gaining acceptance at UNSW (http://teaching.unsw.edu.au/peer-assessment). Further, the use of technology to support learning and teaching, including peer review and assessment, in Engineering at UNSW has been described (Russell and Posada 2011). This paper describes use of the Workshop (peer review) activity in Moodle, as it exists or with modifications, to support and enhance learning activities and assessment tasks in selected Year 1 Science courses.

The context – Year 1 Science courses

The Faculty of Science at The University of New South Wales offers a range of courses with a SCIF (Science Faculty) prefix. In Year 1, these courses are designed to support transition to university study by providing a sense of belonging but also cognitive challenge and development or enhancement of skills relevant to the professional scientist. Specifically, these courses, literally and/or thematically "professional perspective and practice" courses, are designed to:

- engender a sense of belonging or acculturation, among students, to strengthen identity within the cohort, but also with scientists and the professional community to which students aspire;
- develop or enhance soft skills, graduate attributes or capabilities (professional practice), and;
- develop perspectives on science, including the history and philosophy of science, the discipline or area of interest, the community serving an area or discipline, and professional life within that community (professional perspective).

These courses comprise two major components. The first is a either a lecture series covering history and philosophy of science, or a discipline module variously incorporating research activities processes or lectures contextualised within specific scientific areas or disciplines (e.g. chemistry, medical sciences and so forth, from which students choose one). While the SCIF courses differ in the first component, the common second component comprises tutorials focusing primarily but not exclusively on the first two aspects of design above.

Given its pervasiveness in professional life in the sciences and academia and its increasingly recognized role as an active learning process, peer review represents a critical activity appropriate to the themes of professional perspective and professional practice in SCIF courses. All these SCIF courses employ Moodle as the learning management system/environment, currently in pilot mode at UNSW. The following sections describe assessment tasks typically used in the courses, the integration of peer review with those tasks and how the use of Moodle and specifically the Workshop activity, in its present form, or with our recent modifications, facilitates the peer review process.

Essays

Students complete two essays; in both cases, three peers review those essays. The first is a short (600 word) biography, based on an interview of a classmate. This task is designed to promote belonging (within the cohort), to build on classroom activities around written communication, to assess student ability in written communication and provides the first opportunity for peer review. The feedback from this essay is provided back to the author while, in parallel, the essay is marked by the tutor/teacher. The emphasis on peer review with this essay is then around the *process* of peer review rather than utilizing peer review for the *product*. This aligns with providing students with early engagement with the peer review process and classroom activities and discussion around peer review in the sciences. It is also seen as formative for the peer review process itself, as it relates to further use of peer review in the course.

The second essay is a longer (1800-2000 word) personal prospective biography. Students are asked to consider where they will be, professionally, in 15-20 years' time, acting as though they, as a current student in the SCIF course, are interviewing themselves in the future. Thus, this task aligns with the first essay, from present to future. More generically, the tasks align with a course emphasis on written communication and, as the genre is the same, feedback on the first essay scaffolds the second. The peer review process for this essay emulates more fully the research publication process; students submit a draft version of their essay, like an original manuscript, which is then reviewed by three peers. The reviews are made available to the author of each essay, allowing them to review and revise their essay as the feel appropriate, prior to final submission for marking. Thus, this task makes use of peer review not only once again as a *process*, but to facilitate enhancement of the *product*.

Both of these learning and assessment processes are supported using the standard workshop activity under, at the time of writing, Moodle 2.2.1. Three students are assigned, randomly, to review (or assess) the essay of each classmate. Prior to that review, each student is required to review three essays drawn from previous students, using the same criteria as used to review the current essay; these exemplars are of varying quality and have been assigned comments and marks against each of the marking criteria. The use of Moodle automates the assignment of reviewers as well as supporting the scaffolding of the peer review process, as students are able to compare their review of each exemplar with that of the teacher, as expert, for each criterion, and overall, both qualitatively and quantitatively. This enhances the student-centeredness of the activity while greatly enhancing efficiency for the teacher. In the case of the second essay, the formative feedback from the first essay and the opportunity to review the second essay prior to marking results in a better final essay (as observed by tutors), enhancing quality of the final essay and thus efficiency in marking (fewer corrections to be made). This aligns with the observation, in a study of educational practices in the sciences, that "*no learning gain was connected to the writing* [of a scientific report]*, whereas the computer-supported peer assessment appeared to be entirely responsible for the measured "average" learning gain…*" (Bos 2009).

A limitation of the current workshop activity is the lack of functionality around rating of peer reviewers prior to engaging in the peer review of essays. There is a simple rating process that can be applied post-review, though this is invisible to the students. We wanted to provide students with an indication of how they compared to the expert review (and indeed with each other) through assignment of a score for the capacity to review, and to use that score, optionally, as a weighting against the mark for their own essay and/or that of their peers. We have developed and are currently trialing a modification to the Workshop activity that reflects or indeed emulates the rating of expertise of reviewers associated with a range of professional or educational sites and applications such as, respectively, ScholarOne Manuscripts (http://scholarone.com/products/manuscript/) or Calibrated Peer Review (CPR; http://cpr.molsci.ucla.edu/Home.aspx).

Group assignment

Aligned with another theme of the course, group or teamwork, students undertake a group assignment after completion of experiential learning activities that deal with group dynamics and roles. This involves a group of 3-4 students preparing for and conducting an interview with a professional scientist, typically a member of the academic staff. Students are provided with a starting set of questions, though they are able to shape the interview both before and during its conduct. The interview is conducted using video such that the students produce a video or multimedia product featuring video that tells, in 5-10 minutes, the story of the subject's career in science. This task serves a range of educational purposes, aligned with the aims of the course. The interview provides insight into a professional future (aligning in turn with the prospective biography essay task), provides a task in which members of a group can assume specific roles (aligned with classroom instruction and activities around groups or teams), adds a technological and cognitive challenge, at least for some, in the production and editing of video as a new media project (thereby aligning with inquiry or problem-based learning and the need to learn new techniques, as in scientific research) and provides a readily accessible format (and an alternative to the written form) for other students to gain insights into professional futures, as they undertake peer review.

In the past, students have had to assess this assignment 'offline'. The video or a link to it, or to a multimedia product, such as a web site, has been uploaded into Moodle. One or more groups of students have been assigned randomly and manually to assess the product from each student group. Students have been required to assess the product individually but then to collaborate in providing an overall group review of each product, against the requirements of the assignment (*process and product*) as well as other broad criteria relating to the product. Students also have to provide an individual account of their experience of, role in and contribution to the group assignment (a focus on *process*).

The current Moodle workshop activity is designed for the assessment by one or more individuals of assignments produced by individual students. To utilise the existing workshop activity for review of the group assignment, each student in a given group would have to upload the same assignment (which would seem somewhat pointless even if using a link to a file rather than each student uploading the full video). Similarly, the reviewers from the one or more assigned reviewing groups would have to be manually allocated which, in a large class, would take a significant amount of time. We have now modified the workshop activity to include a "Team mode" so that each group can upload just one copy of their assignment and one or more groups can be assigned to review the assignment, though review still involves individuals within each of the assigned groups. While this has the benefit of providing multiple reviews to a group, even if only one review group is assigned, we still wish to develop the tool for full group-to-group review.

Seminar/debate

Oral communication, as a technical seminar presentation and/or debate, is embedded as an assessment task in all Level 1 SCIF courses. As with other elements of the course, this task aligns with professional practice, and follows classroom activities around instruction in and discussion of effective technical oral communication (and, particularly in the case of debates, may draw on activities and discussion of ethics and codes of practice).

We focus on the seminar task here. Students must deliver a short (typically 5-minute) seminar on any topic of their choosing, the only proviso that it must relate to science. Free choice is given so as to allow for the best possible delivery by each student; the primary focus is on communication rather than technical content, and performance may be constrained if choice is restricted or the topic assigned. Three peers and the teacher assess each seminar. The assignment of peer reviewers is a highly involved process, as the seminars are delivered within tutorial groups, over multiple weeks. Further, specific allocation is required as, first, it is not desirable to have students reviewing just prior to their own delivery, so they have the opportunity to relax and prepare mentally before their seminar and, second, students are required to reflect on their seminar immediately after their performance, impossible if they are assigned to review.

Unlike the other assessment tasks where random allocation is perfectly acceptable, this obviously makes random allocation impossible. While the initial assignment of reviewers within a given tutorial group and week of presentation is randomized, the final allocation is refined according to the needs just described.

Assessment employs an instrument (mark sheet) that allows for rating of different aspects of the seminar across three broad categories, the speaker, visual aids, and structure and content. There is space for provision of comments and an overall mark and grade. Students become familiar with the instrument when the teacher delivers a ‘how to give a seminar’ seminar. In the past, the course coordinator has gathered the mark sheets after the seminars, collating and photocopying them as records of assessment and, finally, returning them to the students; for a large class, this is a very time-consuming and tedious process.

We have modified the Moodle workshop activity to allow for upload of a comma-delimited (.csv) file produced from a spreadsheet of assigned reviewers. This means that the specific reviewers assigned to each seminar (or any task, for that matter) no longer have to be allocated manually within Moodle; after the initial necessary allocation of reviewers in a spreadsheet (an unavoidable task), the upload to Moodle is automated, saving a great deal of time.

The student, as presenter, submits to the workshop activity their visual aids (typically a Powerpoint file), a script, or simply a ‘dummy file’ as their assignment. The accumulative grading mode is used as that provides the representation closest to the use of the mark sheet. The reviewers, both teachers and students, are then able to transcribe their reviews to the workshop activity, entering as words the rating chosen for each criterion with any specific comments and a numerical rating out of 10. This process concludes with upload of any final or overall comments, an indicative grade and a mark out of 20. This mode is a little clumsy; for the most part the Rubric mode would align best with the format of the mark sheet, but there is no provision for inclusion of comments. Thus, the workshop activity requires further modification to permit selection or inclusion of multiple modes of assessment (rubric and/or accumulative grading and/or comments). This is under discussion. Regardless, the upload of feedback to Moodle by all participants shares the workload and aligns better with the practice and benefits of peer review. It also improves the quality of feedback as presenters are provided with mature typescript rather than handwriting that may be note form and thus difficult to read and/or interpret.

Conclusion

Through the use of the Workshop activity, as-is or with our modifications, we have been able to facilitate online peer review, providing students in Year 1 Science courses with opportunities, through various assessment tasks and different models of peer review, to engage in peer review not only for its own sake (as a professional practice), but as a mechanism to enhance learning through active or reflective practice. Collectively, these activities align with all three themes of ascilite 2012: peer review promotes learning for the future, both generically, in promoting self-efficacy, and professionally, in early engagement in the practice; further, integration of peer review in high-end programs in the sciences is particularly important as these programs are considered incubators of scientific leaders in the future, and; as we embrace increasingly the use of technology in teaching and learning, including the imminent enterprise implementation of Moodle at UNSW, the ongoing development and refinement of educational technologies to support pedagogies demonstrates leadership in a climate of change.

The innovations in Moodle represent collaboration between academic staff in Science and Engineering and the Faculty of Engineering Learning and Teaching Team who, through the nature of open source software, were able to modify and add to the Moodle Workshop activity to suit the needs of UNSW users. The following key modifications facilitated the assessment activities described above:

- Team Mode, allowing teams/groups to submit assignments for review by members of other teams/groups within the course (there are plans for further modification, allowing team to team review);
- CSV Allocation Upload, allowing instructors to create a spreadsheet of students and staff to be assigned as reviewers within activities, and;
- Reviewer Calibration, allowing instructors to rate the expertise of students in marking by having them mark samples assignments, which the instructor has already determined how the samples should be marked.

While not available in current versions of Moodle, these modifications have been submitted to Moodle HQ for incorporation into Moodle Core code, making the modifications available globally to all users of Moodle.

Exploring the relationship between afforded learning tasks and learning benefits in 3D virtual learning environments

Barney Dalgarno
School of Education and RIPPLE Research Institute
Charles Sturt University

Mark J.W. Lee
School of Education and RIPPLE Research Institute
Charles Sturt University

In this paper, we build on our previously proposed model of learning in three-dimensional virtual learning environments (3D VLEs) (Dalgarno & Lee, 2010) by exploring the relationship between learning tasks that are afforded by such environments and learning benefits that arise from their use. We draw on data from a questionnaire in which 53 of the 117 higher education respondents described how they used 3D VLEs with their students and indicated the degree to which they believed each of the five potential learning benefits occurred. The results provide strong support for the idea that each of the benefits occurred, but suggest the links between learning tasks and learning benefits are, at this stage, unclear. We postulate some of the possible reasons for these findings and make recommendations for further research, discussing some of the challenges involved in designing studies that seek to relate afforded learning tasks to learning benefits through measurement of actual learning outcomes.

Keywords: 3D virtual learning environments (3D VLEs), virtual worlds, affordances, learning tasks, learning design, learning benefits, educator perceptions

Introduction

In an article published in the *British Journal of Educational Technology* (BJET) (Dalgarno & Lee, 2010), we systematically reviewed published research on three-dimensional virtual learning environments (3D VLEs) from the past 20 years and carried out a theoretical analysis based on that body of research, with the goal of identifying a set of unique characteristics of 3D VLEs as well as a series of learning benefits arising from tasks afforded by such environments. The results of that analysis led us to propose a model of learning in 3D VLEs (see Figure 1). The model includes 10 distinguishing characteristics of 3D VLEs, the first six of which relate to aspects of the representational fidelity of 3D VLEs, and the remaining four of which relate to the aspects of the learner–computer interactivity these environments are able to facilitate. We argue that the 10 environmental characteristics give rise to three characteristics associated with the experience of using or ‘being in’ the virtual environment (construction of identity, sense of presence and co-presence), and that the environmental and experiential characteristics, either together or individually, then afford various types of learning task, which in turn lead to a set of five potential learning benefits that are believed to accrue from the performance of those tasks. We conclude the BJET article by pointing to the dearth of empirical insight available about the precise nature of the relationships between each of the environmental and experiential characteristics of 3D VLEs, the types of learning task they afford, and their potential learning benefits. The focus of this paper is on the relationship between the afforded learning tasks and learning benefits, from the perspective of higher educators who have used 3D VLEs in their teaching.

Background and related work

Over the years, attempts have been made by a number of authors to classify or taxonomise applications and learning activities/designs in the area of 3D VLEs, and there has been substantial recent interest in such efforts, spurred by the advent and growth of the current generation of massively multiuser 3D virtual worlds such as *Second Life*. For example, Ryan (2008a, 2008b) outlines 16 pedagogical approaches or ‘ways’ of using *Second Life* and other virtual worlds as educational tools, supported by a range of different datasets including but not limited to survey responses, formal interview transcripts and notes from meetings and informal conversations, as well as her own personal observations, reflections and ethnographic journal entries. Some of the ‘ways’ Ryan suggests of using the technology are ‘to add a visual element’, ‘to house an interactive library or collection of learning objects’, ‘as a connection device (i.e. for communication)’, ‘as a role-playing device’, ‘as a simulation device’, ‘to facilitate games for learning’, ‘to conduct virtual tourism and field trips’, ‘for machinima creation’ and ‘for building “for the sake of learning how to build”’. A similar list is presented by Kay and FitzGerald

(2008), although the method and approach they followed to arrive at the list is largely unclear. Their list comprises categories of educational activity in *Second Life* including but not limited to the following: 'self-paced tutorials', 'displays and exhibits', 'role-plays and simulation', 'data visualisations and simulations', 'historical recreations and re-enactments', 'machinima construction' and 'treasure hunts and quests'. Both Ryan's 'ways' of using *Second Life* and Kay and FitzGerald's types of educational activity in *Second Life* bear likeness on a number of fronts to the 'educational activities' dimension of the taxonomy developed by Jiang (2008) as an outcome of his analysis of virtual worlds in higher education. This dimension is one of six dimensions in Jiang's taxonomy, which he used to classify the literature reviewed for his Masters research and also as a framework for discussing institutional case studies of the use of the technology in three UK universities. The categories in this dimension are 'virtual quests', 'collaborative simulation', 'collaborative construction', 'virtual laboratory', 'virtual fieldwork', 'role-play', 'game-based learning' and 'attending lectures/classes'. Hew and Cheung's (2010) international meta-analysis of studies reporting on 3D VLE use in K-12 and higher education culminated in the identification of three much broader categories describing the main purposes for their use: as communication spaces, for simulation of space (spatial) and as experiential spaces ('acting' on the world).

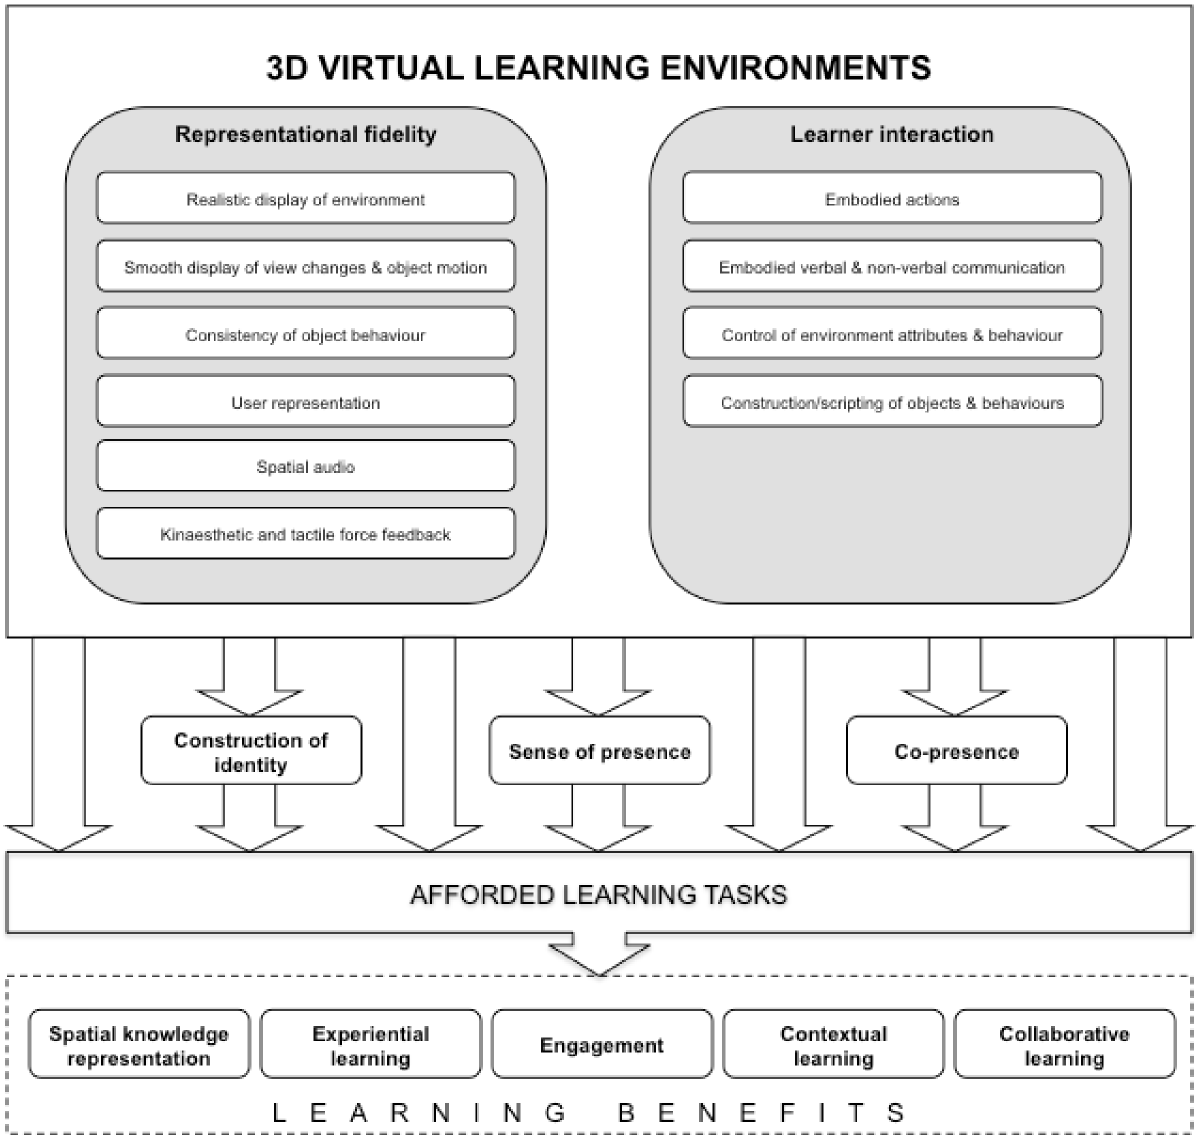

Figure 1: A model of learning in 3D VLEs (Dalgarno & Lee, 2010)

While evidence of the actual learning benefits brought about by the use of 3D VLEs is sparse (Dalgarno & Lee, 2010; Lee & Wong, 2008; McLellan, 2004; Mikropoulos & Natsis, 2011), much has been written in recent years about the possible and purported benefits, fuelled again by the burgeoning interest of educators in the current generation of 3D virtual world platforms. One approach to understanding the benefits of learning technologies is to consider their use from an affordance (Gibson, 1979, Norman, 1988) perspective. In the most basic terms, an affordance of a tool is an action made possible by the availability of that tool. Hollins and Robbins (2008), for instance, discuss five broad educational affordances of virtual worlds – ‘identity’, ‘space’, ‘activity’, ‘tools’ and ‘community’ – drawing on their observations and data collected through their experiences as tutors, researchers, long-term residents of *Second Life* and players of other massively multiplayer online role-playing games (MMPORPGs). Warburton and Pérez García (2009), in their review of educational uses of virtual worlds focusing particularly on *Second Life*, characterise the main educational affordances of *Second Life* as being the creation of opportunities for ‘extended or rich interactions’ between individuals and communities, between individuals and artefacts, and among intelligent artefacts; ‘visualisation and contextualisation’ through the production and reproduction of otherwise inaccessible content; exposure of learners to ‘authentic content and culture’; ‘individual and collective identity play’; ‘immersion’ in the virtual environment; ‘simulation’ of contexts that may be prohibitively expensive, impractical or impossible to reproduce in real life; ‘community presence’ in the way of promoting a sense of belonging and purpose; and ‘content production’ opportunities enabling the creation and ownership of the learning environment and objects within it. Lastly, Lim (2009) derived a framework that he dubbed the ‘Six Learnings of *Second Life*’, based on his own experiences and reflections of using *Second Life* in his teaching and research. He recommends that in-world curricular interventions be designed to target one or more of the ‘Learnings’ of ‘Learning by exploring’, ‘Learning by collaborating’, ‘Learning by being’, ‘Learning by building’, ‘Learning by championing’ and ‘Learning by expressing’. These ‘Learnings’ may be viewed as types of affordance of 3D VLEs for learning.

In much of the extant literature in this area, including many of the aforementioned sources, there is no clear differentiation between the affordances and benefits of the use of 3D VLEs; the two concepts are often treated as one and the same. One exception is the work of Dickey, who has published the findings of a number of studies aimed at examining and comparing the affordances and constraints of specific 3D VLE platforms, including *blaxxun interactive* (Dickey, 1999), *OnLive! Traveler* (Dickey, 1999), *Active Worlds* (Dickey, 1999, 2003, 2005, 2011), *Adobe Atmosphere* (Dickey, 2005) and most recently, *Second Life* (Dickey, 2011). The approach taken in some of these studies (Dickey, 2003, 2011) has been to attempt to determine the affordances of the environment in question from the perspective of the user through methods such as participatory observations, class logs and interviews with students and teachers, while in others (Dickey, 1999, 2005) the affordance analysis has centred around a review of the software by the researcher to identify specific features and functionalities.

In proposing our model of learning in 3D VLEs (Dalgarno & Lee, 2010, see Figure 1), we adopt a view that is consistent with the conception of Norman (1999), who differentiates between ‘real’ and ‘perceived’ affordances and argues that until an affordance is perceived it is of no utility to the potential user. Our view that what is ‘afforded’ is not specific learning benefits or outcomes, but rather the tasks that educators/educational designers and learners perceive the technology as being useable for. The model recognises that the technologies themselves do not directly cause learning to occur, but that the afforded learning tasks *may* give rise to certain learning benefits. Importantly, our model is explicitly framed and presented as a theoretical one that encapsulates what scholars are asserting to be the distinguishing characteristics and potential learning benefits of 3D VLEs, as well as those that are implicit in the design of 3D VLE applications described in the literature. As argued in Dalgarno and Lee (2010), many of these assertions and implicit assumptions are in need of further empirical investigation and validation; the research reported in this paper is an attempt to partially address this need. Specifically, the aims of the research were to:

1. determine the extent to which higher educators perceived the five learning benefits in Dalgarno and Lee’s (2010) model to be occurring when using 3D VLEs with their students; and
2. explore the relationship between the afforded learning tasks (as identified through a grounded analysis of the higher educators’ descriptions of the 3D VLE-based learning activities their students undertook) and the perceived learning benefits.

Methods and data sources

The research described in this paper was part of a larger scoping study on the use of 3D virtual environments for learning and teaching in higher education in Australia and New Zealand (Dalgarno, Lee, Carlson, Gregory & Tynan, 2011a). The scoping study was sponsored by the Distance Education Hub (DEHub at http://www.dehub.edu.au/), a federally funded cross-university research consortium, during 2010 and 2011. It included an online questionnaire completed by 117 academic staff from higher education institutions across Australia and New Zealand, as well as follow-up semi-structured interviews with a number of those staff. Several educational designers/developers and information technology support staff were also interviewed.

This paper reports on the responses of the 53 academic staff who indicated in their questionnaire responses that they had used 3D VLEs in their teaching, then proceeded to describe in detail their use of the technology with their students in a particular subject or unit. Specifically, responses to the following questions are reported here:

> Question 116. *Please describe the main learning activities that your students undertook within the 3D immersive virtual world environment.*
>
> Question 120. *With respect to the outcomes you have observed in this subject/unit, please indicate the extent of your agreement with each of the following statements. The use of 3D immersive virtual worlds:*
> *a) assisted learners in developing familiarity with a place and the objects within it;*
> *b) was motivating and engaging for learners;*
> *c) led to improved transfer of learning to real situations;*
> *d) led to more effective collaborative learning;*
> *e) allowed learners to learn through experience in context.*

Question 116 was an open-ended question designed to obtain a descriptive account of the learning activities carried out by students. Data from this question were inductively analysed using the constant comparison method (Corbin & Strauss, 2008), with each of the responses initially being read at face value to produce a preliminary (candidate) list of codes. The codes were gradually refined as subsequent passes were made through the data and the content was reviewed in greater detail, allowing common strands to be factored out. As part of this iterative process, codes were added, deleted, merged, split and renamed. Ten categories eventually emerged from this analysis, as discussed in the next section.

Question 120 required responses on a seven-point Likert scale ranging from ‘Very Strongly Disagree’ to ‘Very Strongly Agree’. The five categories of learning outcome were intended to align with the five learning benefits in the Dalgarno and Lee (2010) model.

Results

Categories of learning activity

The responses to Question 116 were each assigned one or more of the following 10 grounded categories of learning activity emerging from the analysis:

- Place exploration;
- Concept exploration;
- Task practice;
- Role-play;
- Gaming;
- Communication;
- Slide show;
- Building or scripting;
- Instruction; and
- Machinima.

The types of learning activity assigned to each category are discussed in the subsections below. It is important to note that the categories are not mutually exclusive, that is, some of the responses (indeed, most of them) described learning activities belonging to more than one category. Conversely, some responses did not fit into any of the categories and were thus assigned an ‘Other’ category. One of the responses was unable to be coded based on the information provided.

Place exploration
These are activities in which learners visit and experience simulated places. The virtual places visited may be models of real-world places or may alternatively be virtual spaces designed to exemplify particular aspects of the real world. For example, a Religious Studies lecturer described an activity in which her students explored virtual spaces modelled on places of worship and were presented with informative note cards, landmarks and links at various points during their exploration.

Concept exploration
These are activities in which students explored visualisations and interactive examples of concepts in action. For example, a lecturer of a foundation-year Management subject described an activity in which students explored and manipulated a simulation of a business environment to develop an understanding of specific theoretical concepts.

Task practice
Activities in this category focus on the practising of procedural tasks in a virtual simulated environment. Such tasks might be overly expensive, dangerous, time consuming or inconvenient to practise in the real world. For example, one respondent described an activity in which Midwifery students used a simulated environment to practise the management of a postpartum haemorrhage.

Role-play
In these activities, students take on and act out roles as part of a given scenario in order to develop an understanding based on firsthand experience from the perspective of one or more of the roles occurring in the modelled situation. One respondent described an activity in which Criminal Law students role-played the delivery of trial submissions within a simulated virtual courtroom environment.

Gaming
Activities assigned to this category sought to challenge learners as they worked towards the achievement of individual or cooperative goals. Typically, in these activities, there was a sense in which the student 'won' the game once the goal was met. For example, an Education lecturer described a game in which educational psychology theories and concepts had to be mastered in order to achieve the goals within the game.

Communication
Many respondents described activities that had communication between students as a central purpose, for instance to discuss the ideas within a subject or to work on group project tasks. As an example, one respondent described an activity in which students worked collaboratively to develop accessible web sites for organisations and used *Second Life* to meet with clients based in other countries.

Slide show
This category included activities in which students viewed or created slide shows within the 3D VLE. For example, PowerPoint images, photographs and other two-dimensional graphical content are able to be rendered on a 'screen' in *Second Life* with the help of a special slide projector object. The content can be browsed independently by students or used as visual aids during a lecture or other synchronous class activity.

Building or scripting
Activities in this category required students to construct places and objects, and in some cases write programs or scripts, within the virtual world. In one activity, Information Systems students created software artefacts embedded in objects in *Second Life* and integrated them into scenarios to model processes applicable to a real business case.

Instruction
In this category were activities in which teachers delivered lectures, tutorials or content-based presentations to their students within the 3D VLE. It also included activities in which the students themselves delivered their own 3D VLE-based presentations.

Machinima
A few respondents' learning designs involved students creating or using pre-created 'machinima' – animations or 'movies' that record action occurring within a 3D virtual environment. Respondents described the use of machinima sequences for various purposes, including as introductory material to foreground exercises and concepts to be covered in face-to-face lessons, as well as to provide a narrative context and scaffolding for 3D VLE-based activities. In some cases the students viewed the machinima clips while immersed within the 3D VLE; in others, the clips were embedded in a subject/unit website or courseware package external to the 3D VLE.

Reported learning benefits

Responses to the five parts of Question 120, which asked respondents for their degree of agreement with a series of statements about the possible learning benefits of the 3D VLE-based learning activities, were scored from 1

(Very Strongly Disagree) to 7 (Very Strongly Agree). The responses in relation to each possible learning benefit are summarised in Table 1. Most noteworthy here is that most respondents agreed with all five statements, that is, regardless of the design of the particular activity, it would appear that most respondents thought that all five learning benefits occurred. The following section, then, looks at the relationship between the category of learning activity based on the analysis discussed above, and the reported learning benefit.

Table 1: Summary of responses relating to the reported learning benefit of each virtual world implementation

Reported learning benefit	**Frequency (*N* = 53)** Very Strongly Disagree (1)	Strongly Disagree (2)	Disagree (3)	Neutral (4)	Agree (5)	Strongly Agree (6)	Very Strongly Agree (7)	***Mean***
Assisted learners in developing familiarity with a place and the objects within it	2	0	5	8	16	19	3	***5.0***
Was motivating and engaging for learners	0	0	0	3	13	21	16	***5.9***
Led to improved transfer of learning to real situations	0	0	2	11	8	20	12	***5.5***
Led to more effective collaborative learning	1	0	1	6	12	23	10	***5.6***
Allowed learners to learn through experience in context	0	0	1	5	9	26	11	***5.8***

Comparing learning activities to reported learning benefits

In order to determine whether there was a difference between the learning benefit perceived to have occurred by respondents that were using different categories of learning activity, a Multivariate Analysis of Variance (MANOVA) procedure was carried out, with the 11 categories of learning activity as independent variables and responses to the five parts of Question 120 as dependent variables. Table 2 shows the mean response to the parts of Question 120 relating to each of the five learning benefits, broken down according to the categories of learning activity identified. Where the MANOVA procedure indicated there was a significant difference in response between those whose reported activities were assigned a particular category and those whose reported activities were not, this is also shown in the table.

Table 2: Mean response to questions about learning benefits for each category of learning activity and MANOVA results showing where a significant main effect of learning activity was found

	Learning benefit (1 = Very Strongly Disagree – 7 = Very Strongly Agree)				
Learning activity category	Assisted learners in developing familiarity with a place and the objects within it	Was motivating and engaging for learners	Led to improved transfer of learning to real situations	Led to more effective collaborative learning	Allowed learners to learn through experience in context
Place exploration (n = 9)	5.6	5.4	5.6	5.2	5.6
Concept exploration (n = 7)	4.0	5.9	5.7	6.1	6.3
Task practice (n = 5)	6.0	5.6	5.6	6.4	5.0
Role-play (n = 23)	6.0	5.7	5.6	6.0	5.0
Gaming (n = 1)	5.0	5.0	5.0	5.0	4.0
Communication (n = 21)	5.8	6.0	5.8	6.0	5.0
Slide show (n = 7)	6.2	5.7	5.7	6.0	4.8
Building or scripting (n = 9)	5.3	5.7	5.7	6.1	5.2
Instruction (n = 12)	6.1 *significant* $F(1,40)=4.841$, $p = 0.034$	6.2 *significant* $F(1,40)=4.136$, $p = 0.049$	5.8	6.3	5.4
Machinima (n = 6)	6.2	5.7	5.7	6.0	4.8
Other (n = 11)	5.6	5.3	5.0	5.9	5.5
Uncoded (n = 1)	7.0	7.0	7.0	7.0	6.0
Mean **(N = 53)**	***5.0***	***5.9***	***5.5***	***5.6***	***5.8***

Discussion and recommendations for future research

Based on the theorised relationship between learning activities and learning benefits within our model (Dalgarno & Lee, 2010), we hypothesised that the perceived learning benefits of each implementation would vary depending on the characteristics of the learning activities undertaken by the students. For example, we expected learning activities categorised as ‘place exploration’ to be more likely to ‘assist learners in developing familiarity with a place and the objects within it’, and to allow ‘learners to learn through experience in context’. We also expected learning activities involving ‘task practice’ or ‘role-play’ to result in ‘improved transfer of learning to real situations’, and learning activities involving ‘communication’ to lead to ‘more effective collaborative learning’. However, there were statistically significant differences according to the category of learning activity in the responses for only two of the learning benefits, namely those relating to place familiarity and motivation and engagement. In both cases, respondents whose learning activity included ‘instruction’ had a higher mean response rate, while there were no significant differences for any of the other learning activity categories. The finding that instructional learning activities were perceived to result in higher levels of place familiarity and engagement than other activities such as place exploration and gaming is surprising, as is the absence of any other significant main effects of learning activity on perceived learning benefit.

There are a number of possible explanations for the results of this analysis. One explanation relates to the fact that a majority of the learning activities were found to belong to more than one category. This suggests that the tasks set by the educators for their students were often quite holistic, perhaps involving a number of quite different learning activities. For example, if a learning task required students to take in instruction, then explore locations within the virtual environment, and while doing so communicate with one another using the tools provided, it would not be unlikely for multiple learning benefits to occur. Additionally, a wide range of 3D VLE-based learning activities are likely to be intrinsically motivating and engaging, so a lack of difference in perceptions about the degree to which this learning benefit occurred across different learning activities is understandable. Nevertheless, one would still expect to find that across the sample, differences in perceived learning benefits between tasks that involve a particular type of learning activity (e.g. place exploration or communication) and those that do not would still be detectable.

Another possible explanation for the lack of significant differences lies in the very high levels of agreement expressed by the respondents with regard to all five statements about the learning benefits arising from the activities (see Table 1). An earlier finding from the Australian and New Zealand scoping study of which the present research is a part was that there are substantial barriers to the use of the technology, and that institutional support is often limited (see Dalgarno, Lee, Carlson, Gregory & Tynan, 2011b). Given this, we might expect that many of the respondents to the questionnaire were passionate and enthusiastic adopters of 3D VLEs who were prepared to use such environments in their teaching despite the obstacles and challenges that exist. If this was indeed the case, it is possible that the respondents' tendency to agree or strongly agree with all five statements about the learning benefits could be more a reflection of their enthusiasm and positive attitude towards the use of 3D VLEs than an evidence-based assessment of the actual learning benefits occurring from the specific activities their students undertook.

In light of the above, future research needs to consider alternative ways of exploring the relationship between learning activities in 3D VLEs and the actual learning benefits occurring. One approach that could be considered is the use of controlled studies where the actual learning outcomes of students undertaking activities in a 3D VLE are compared with those of students undertaking equivalent, non-3D VLE-based activities (e.g. using other online technologies, or in a face-to-face environment). As pointed out by Clark (1994), however, it is very hard not to confound instructional method with media in such studies, and consequently, such studies are unlikely to identify learning benefits caused solely by the virtual environment. The use of controlled studies of this type in an authentic university context is also problematic because of the ethical issues involved in providing some students with access to a particular learning experience while denying others access to it. Another alternative approach would be to collect data from students to gauge their perceptions of the learning benefits of a particular 3D VLE-based learning activity. Given the fact that many students are initially somewhat cynical of the benefits of such activities (see Dalgarno et al., 2011a), student responses to a questionnaire on the learning benefits of a particular activity could possibly be more realistic than those of the academic who has enthusiastically designed the learning tasks, often investing a substantial amount of his/her own time. Care would need to be exercised in the construction of such a questionnaire to ensure that the terminology used is understandable to students. Terms like 'motivation' and 'engagement' are likely to be reasonably well understood; however, notions such as 'transfer of learning' may require some explanation and clarification.

Furthermore, just as future studies should consider students' perceptions of learning benefits in addition to those of educators, so too should they seek to recognise the differences in perceived affordances (Norman, 1999) between students and educators. In the present study, the various categories of learning activity were derived from educators' descriptions of the activities undertaken by their students within 3D VLEs. It would be worthwhile to ask students to describe what they consider to be appropriate and/or valuable uses of 3D VLEs for learning and teaching and how they would like to see the technology integrated into their courses, to serve as a basis for comparison with the educators' views and intentions. The ways in which students interpret assigned learning tasks and carry out activities (Goodyear & Ellis, 2007; see also Goodyear, 2000) within 3D VLEs and how these might be influenced by the affordances they perceive in the technology also warrant further investigation, as these factors may impact upon both the perceived and actual learning benefits arising from the activities.

Conclusion

The study reported in this paper, which sought to extend our earlier theoretical work as presented in Dalgarno and Lee (2010), explored the relationship between the characteristics of 3D VLE-based learning activities and the learning benefits perceived to have occurred, as reported in an online questionnaire completed by Australian and New Zealand academic staff who had used 3D VLEs in their teaching. There was almost no statistical difference between respondents' degrees of agreement with five statements about the learning benefits across different categories of learning activity. Two plausible explanations for this unanticipated result are firstly, the possibility that many of the learning tasks set for the students involved multiple categories of learning activity and consequently led to a wide range of learning benefits, and secondly, the possibility that respondents' high levels of enthusiasm for the use of 3D VLEs may have caused them to perceive learning benefits beyond those actually occurring. Further research exploring this issue will need to consider alternative approaches to measuring the learning benefits, including, for example, elicitation of students' perceptions as well as assessment of actual learning outcomes achieved, although the latter in particular will not be without its difficulties. Studies are also needed that take into account the perceived affordances of 3D VLEs from the point of view of students, and the effect these might have on their interpretation of learning tasks and performance of learning activities.

Acknowledgements

The data collection for this study was carried out as part of a scoping study on virtual worlds for learning and teaching in Australian and New Zealand higher education institutions that was funded by the Distance Education Hub (DEHub) Research Institute at the University of New England. The authors would like to thank Professor Belinda Tynan, former Director of DEHub, for her generous support and assistance. We also acknowledge the contributions of Sue Gregory (University of New England) and Lauren Carlson (Charles Sturt University), fellow members of the scoping study project team, to the development, implementation and administration of the questionnaire.

The rapidly-developing 21st century world of work and knowledge calls for self-directed lifelong (SDL) learners. While higher education must embrace the types of pedagogies that foster SDL skills in graduates, the pace of change in education can be glacial. This paper describes a social annotation technology, the Collaborative Lecture Annotation System (CLAS), that can be used to leverage existing teaching and learning practices for acquisition of 21st Century SDL skills. CLAS was designed to build upon the artifacts of traditional didactic modes of teaching, create enriched opportunities for student engagement with peers and learning materials, and offer learners greater control and ownership of their individual learning strategies. Adoption of CLAS creates educational experiences that promote and foster SDL skills: motivation, self-management and self-monitoring. In addition, CLAS incorporates a suite of learning analytics for learners to evaluate their progress, and allow instructors to monitor the development of SDL skills and identify the need for learning support and guidance. CLAS stands as an example of a simple tool that can bridge the gap between traditional transmissive pedagogy and the creation of authentic and collaborative learning spaces.

Keywords: self-directed learning (SDL); lecture annotation; learning analytics; motivation; self-management; self-monitoring; metacognition.

Introduction

More than four decades ago, adult educator Malcolm Knowles (1970) argued that the Information Age and the speed of technological development would necessitate constant re-training and re-skilling in most careers. Knowles maintained that to meet future workforce requirements, individuals would require the skills, attributes and dispositions that would allow them to assess their current level of skills and knowledge, and determine their ongoing learning requirements as they progressed through their professional careers. This notion of need for continuous learning (formal, non-formal or informal), with an emphasis on learner independence, has been captured in the term ‘lifelong learning’. As Sharples (2000) argued there is no authoritative definition of lifelong learning. However, the intent of the concept of lifelong learning is well captured by Candy (2000) in noting that the pace of “social, technological, cultural, economic, legal and educational change …emphasizes the need for people who are adaptable and responsive; in short, who are capable of continuing lifelong learning” (p. 102). While education policy and vision statements have rapidly embraced the *ethos* of lifelong learning, it is questionable whether contemporary teaching practice has fully achieved the goal of developing in students the skills necessary for lifelong learning - that is, the skills that allow them to become self-directed and social learners (McWilliam, 2011). This failure is not the result of any lack of appreciation of the importance of developing self-directed learners, but instead most likely reflects the reality that any change in pedagogical practice necessitates a change in our teaching habits (McWilliam, 2005). And habits are notoriously difficult to change.

Few educators would deny the importance of implementing teaching practices that aim to promote and foster the skills associated with becoming autonomous, self-directed learners, as demonstrated by the depth of educational research and discussion in the field of self-directed learning (for review see Knowles, Holton & Swanson, 2011). Although the premise of SDL is now well accepted, there remains much debate over an authoritative definition. Knowles (1970) first defined SDL as:

> The process in which individuals take the initiative, with or without the help of others, in diagnosing their learning needs, formulating learning goals, identifying human and material resources for learning, choosing and implementing learning strategies, and evaluating learning outcomes. (p. 7).

Although the definition of self-directed learning (SDL) has evolved since Knowles's early work, the core message has remained the same. That is, the primary responsibility for learning resides with the learner (Merriam & Caffarella, 1991). This does not imply that SDL is a solitary and isolated process. Rather, SDL is characterized as comprising the skills and abilities necessary for engaging in independent and social learning processes as determined by the individual learner (Brookfield, 2009).

Where early researchers approached SDL from sociological (e.g. Tough, 1971) and pedagogical (e.g. Knowles, 1970) perspectives, the field has since expanded to include psychological dimensions (Pilling-Cormick & Garrison, 2007). Building on the work of Long (1989) and others (e.g. Brookfield, 1986), Garrison (1997) proposed that the kind of educational experiences which effectively promote and facilitate SDL are those that motivate learners to engage in continued learning, and that offer learners opportunities to practice self-management and self-monitoring. Contemporary educational structures and pedagogical practices, on the other hand, remain entrenched in an industrialised model (i.e. a model that emphasises linearity and standardisation) (Robinson, 2000), and learning environments remain overwhelmingly content-centric and transmissive (Conole & Alevizou, 2010). Short of revamping entire educational systems, do tools and approaches exist that can enable and foster SDL outcomes even within the constraints of contemporary learning environments?

We argue in this paper that SDL skills can be developed and promoted within such environments through careful design of interactive tools that extract the artefacts of existing practice to encourage self-management, self-monitoring and motivation (core factors in Garrison's 1997 SDL model). As an example of such tools, we describe an in-house developed educational technology, called the *Collaborative Lecture Annotation System* (CLAS). This web-based annotation resource has been designed to leverage the primary products of existing pedagogical practice (lectures) and student learning approaches (note-taking and review of important highlighted points) in a manner that encourages both the development of lifelong learning skills and reflection on teaching practice. We begin the paper with an overview of the basic architecture and functionality of CLAS, before discussing the theory and principles that underpin it and that have informed its design and functionality. We conclude by suggesting future directions and research related to the application of learning analytics, media and social annotation tools in order to provide further impetus for pedagogical change.

How the Collaborative Lecture Annotation System (CLAS) Works

CLAS allows annotation of educational media

CLAS is a web-based video annotation tool, designed in the first instance to enable students to flag points in a video that they believe to be significant for their learning. Using CLAS, students can annotate lecture videos in the same way that they highlight important sections in text passages within a prescribed course reading. CLAS can be used in the classroom during live lecture presentations that are also recorded and uploaded at a later stage for student and instructor review. Alternatively, students and instructors can use CLAS to interact directly with any previously uploaded multi-media content (e.g. podcasts, vodcasts, or lecture capture). In essence, CLAS has been designed to allow for a cohort of students to share annotations, review peer annotations and allow for instructor feedback in the one collaborative space.

During a lecture, or during later review of a captured lecture or other multimedia resource, all learners can add a 'point-based' (flag) annotation (via laptop or mobile device) to indicate that something of personal significance or importance occurred at that specific point in time (Figure 1) (Risko, Foulsham, Dawson, & Kingstone, In Press). Each individual point-based annotation is time-stamped (post login), and later synchronised with the recorded lecture (post upload). During the lecture, or at a later time, students can also add textual annotations for personal review and reflection or for sharing with peers post-lecture (Figure 1).

On completion of the lecture or lecture review, student individual annotations are saved in a file on the server. All student annotations are graphically presented in an individual annotation timeline (see Figure 1). Students can navigate through their individual timeline by clicking on the specific annotation points. Clicking in the annotation timeline repositions and plays the video (i.e., the lecture) from the point in time corresponding to the selected region. This feature allows students to click on the points in the lecture that they had previously indicated were important and be taken directly to those points in the lecture video. Additionally, when all student annotation timelines are presented, students can readily navigate and review areas of the lecture or multimedia resources that may have fallen outside of their consideration earlier.

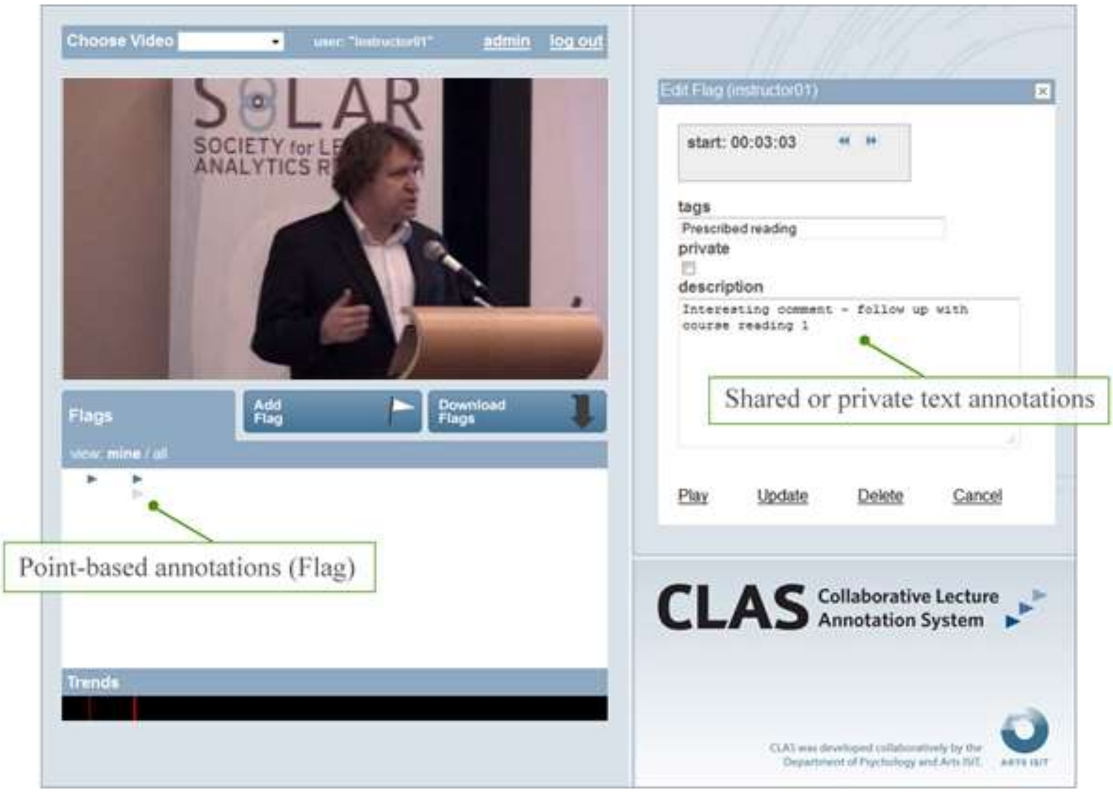

Figure 1: Point-based annotations that are aligned with the video time stamp. This figure illustrates the application of CLAS during a live recorded presentation.

Learners and teachers can view group annotations

Most importantly and whether it is used with live lectures or archived media, CLAS allows both learners and instructors to 'see' areas of learner convergence and divergence with respect to key points in, for example, a lecture presentation (Figure 2). This information can be used by both students and teachers to evaluate learning progression and the effectiveness of the presented materials (Risko et al., In Press). For example, students can assess their own interpretation of important points against those of their peers; instructors, meanwhile, can determine whether students are recognizing and understanding important concepts or material in their lecture materials (identification of areas of convergence and divergence; Figure 2). In this way, visualization and interpretation of captured student interactions can inform decisions regarding future teaching strategies and practices in order to address any identified gaps in the learning process or student understanding (Risko et al., In Press).

Figure 2: Point-based annotations from a student cohort indicating sites of convergence and divergence.

CLAS analytics allow sophisticated student tracking and support

Learning analytics relates to the collection, analysis, reporting and interpretation of user data in learning and teaching contexts (Siemens & Long, 2011). Data may include, for example, learner tracking data in a learning management system or library resource. Analytics models are used to discover patterns, learning and teaching information and social connections particular to individual learners and to learning communities. While this emerging inter-disciplinary field has the potential to support and improve learning and teaching practice and institutional decision making, institutional implementation of learning analytics methods thus far has largely been directed towards decision-making around student admissions, and predicting student attrition rates. Learning analytics nevertheless offer learners new opportunities for tracking their own progress and can motivate students to invest new effort in their learning (Fritz, 2011; Macfadyen & Dawson, 2010). They also permit predictive modeling of student success/failure and can allow educators to identify, early, those students requiring additional learning support (Ferguson, 2012).

CLAS provides learners and teachers with a set of data visualizations and analytics (Figure 3) that may assist in the evaluation of student understanding and guide the learner towards core SDL outcomes. CLAS provides the functionality to analyze:

- the changes students make to their lecture annotations after viewing aggregated class data;
- the number of times an individual accessed a particular lecture or media resource;
- student ‘dwell time’ on a particular media resource;
- the length of textual annotations made by users;
- outliers (students whose flags and/or annotations differ significantly from their peers) (Figure 2).

For learners, comparison of personal data with group data can act as a strong motivator to sustain or increase contribution to and engagement with the class learning community (Gibbons, Blanton, Gerrard, Buunck, & Eggleston, 2000), and can serve to promote self-reflection.

For educators, learning analytics data can assist with identification of individual students who may need additional learning support. Such data can also allow educators to assess the impact of teaching activities or resources and offer critical feedback on student and cohort understanding. For instance, a review of annotations may indicate a common misunderstanding of the core concepts provided within a lecture. Conversely it may also indicate strong understanding with minimal outliers requiring further follow-up. Within the large class context, instructional feedback of this kind is critical for ensuring that each lesson is well scaffolded and builds on student understanding, rather than being tied strictly to a curriculum schedule.

Figure 3: Example analytics on user annotations and interactions.

Design of the CLAS Tool

CLAS was designed with the goal of creating opportunities for students to acquire and practice skills of self-directed learning within existing and often fairly 'traditional' learning contexts. It offers features that are designed to facilitate educational experiences which motivate student engagement, and which promote self-monitoring and self-management – the three core dimensions of Garrison's framework for self-directed learning (1997). To this end, three central principles shaped its design:

1. Learning for the 21st century requires SDL skills and attributes. Educational practice is, however, slow to change (Bates, 2000). Rapid promotion of SDL skills and attributes calls for the implementation of new tools and processes that can leverage existing teaching and learning practices within the current educational landscape.
2. The integration of CLAS into teaching and learning practice must motivate student engagement with learning materials, peers and learning opportunities; and must provide opportunities for self-management of learning resources and activity engagement.
3. CLAS must include features that provide instructors and students with the ability to monitor/ self-monitor learning progression.

Principle 1: Leverage existing teaching and learning structures

Although much continuing educational practice operates on the assumption that learning is largely an individualized activity, current learning theory contends that learning is, overwhelmingly, a social process (Bandura, 1977; Vygotsky, 1978). McWilliam (2011) emphasizes this point, noting that past and future models of education need to move away from individualized instruction (lecture) and re-engage with the idea of a 'café society'. She writes: "When we ignore the educative traditions of café society, we fail to appreciate that *the proper location for lifelong learning is better understood as the café, not the school*" (McWilliam, 2011, p.2). Reflecting contemporary educational theory, McWilliam's 'café' represents the multiplicity of possible sites for learner engagement - sites for dialogue and sharing of social and cultural perspectives that facilitate the collective construction of knowledge. The traditional lecture format, however, offers only limited opportunities for diverse discussion and debate.

CLAS has been designed to facilitate both self-directed and collaborative learning opportunities using easily captured video- or audio- recordings of in-class lectures, and offers the possibility of turning transmissive pedagogy and solitary learning into moments of rich engagement. The tool was designed to make the extraction of key content from multi-media (e.g. lecture capture, vodcasts, podcasts, etc.) a more collaborative and interactive process for students, who can annotate a lecture video either with a simple flag or with their own expanded reference notes. The one-click point-based annotation allows students to highlight important sections of the lecture or video without undue cognitive load or disrupting flow.

CLAS facilitates the sharing of student annotations, and allows benchmarking of progress and understanding against that of peers. While this tool is only a partial substitute for more discursive peer to peer engagement, it represents a significant step in leveraging the artifacts of the lecture format to provide a more socially grounded learning experience. For instructors, CLAS joins the group of available easy-to-use tools that encourages experimentation as they navigate the transition from transmissive pedagogy to creation of a more authentic and collaborative learning space.

Principle 2: Motivate learner engagement, create opportunities for self-management

The importance of motivation in influencing student learning is well established (Pintrich & Schunk, 1996). While educators may disagree about whether motivation must originate in the student, or whether it can or should be imbued by the teaching/learning process (Ramsden, 1997), there is little debate about the importance of motivation for future academic success (Dweck, 2000; Hodges, 2004; Pintrich, 1999). Proficiency in SDL necessitates not only a certain degree of motivation to engage in the learning process, but also the capacity to assess achievement and performance against established criteria or goals (Nicol & Macfarlane-Dick, 2006). Garrison (1997) separates the dimension of motivation into two sub-components: motivation to select and establish "goals and intentions" (p. 27) for learning; and "task motivation" – the motivation to 'stay on track' and complete the required learning activities.

A key element influencing student task motivation is feedback. While student motivation to persist is also influenced by a range of intrinsic and extrinsic factors (e.g. grades, future career goals, instructor, assessment), it is critically impacted by the level and quality of feedback received (Butler & Winne, 1995). More traditionally, learner feedback has been provided via a set of assessment tasks (formative and summative). Self-reflection, and peer engagement can, however, offer additional opportunities for learner feedback and can therefore assist with maintaining task motivation and persistence. CLAS was designed to promote peer-peer interaction and collaborative and active construction of knowledge through sharing of annotations and multi-media resources. These forms of social interactions present additional opportunities for students to obtain feedback and assess their level of understanding against group norms. Depending on course design, CLAS can also provide additional opportunities for private or public instructor feedback, via textual or video annotations.

Learning analytics derived from CLAS activity offer a further source of potentially motivating feedback to learners. By aggregating student annotation timelines, CLAS gives all learners the opportunity to observe, compare and evaluate the level of their engagement efforts, and overall learning annotations with those of peers. For learners, this form of social comparison provides a critical source of feedback that can motivate continued engagement and learning (Fritz, 2011; Gibbons et al., 2000). Although learning analytics data do not provide low performing students with guidance on specific learning strategies to adopt, they do indicate the sites of difference in the perceived importance and written annotations occurring between students (figure 2). This process of social comparison is now being adopted across the field of learning analytics and educational data mining - that is, the comparison of an individual's level of engagement with course materials and activities presented in a learning management system against that of peers. For instance, the Purdue University Signals project makes use of group comparison data to provide automated early warning signals to students regarding their progress in a particular course (Arnold, 2010).

In addition to encouraging student motivation, CLAS allows students to self-manage their own engagement with available learning resources and with peers. The degree and style of interaction with each captured lecture or media resource depends entirely on the needs and preferred learning strategy of the individual student. For example, learners may or may not choose to share their own annotations with others; they may simply review their own 'highlights', and/or can choose to search and browse group annotations based on social tagging (see figures 1 and 2). Depending on assessment tasks and learning activities designed by the instructor, CLAS offers additional possibilities for learner engagement: captured video from class activities may be used for self-reflection, peer review or instructor feedback; compiled personal or group video annotations may form the basis for self-reflection or collaborative writing.

A core goal of CLAS is to build on ‘traditional’ lecture content, and offer learners an enriched set of opportunities for more socially oriented and participatory learning. As with all socially mediated technologies, the greater the number of students engaged in the process, the greater the number of learning resources generated. The increased numbers of available resources provides a direct positive feedback loop for further enhancing motivation.

Principle 3: Offer tools for monitoring and self-monitor learning

Perhaps the strongest benefit that CLAS offers learners is the capacity for self-monitoring: reflection on new information (meta-cognition) gained through adoption of a particular learning strategy (cognition), and the subsequent construction of personal meaning (Garrison, 1997). Meta-cognitive proficiency, in particular, is tightly correlated with academic success and problem solving ability (e.g. Butler & Winne, 1995; Pintrich, 1999; Zimmerman, 2002; Zimmerman & Schunk, 2001). The capacity for self-monitoring has direct impact on the level and quality of study and therefore, overall learning progression and academic achievement (Dunlosky & Thiede, 1998). Kruger and Dunning (1999) elaborate this point, noting that “the skills that engender competence in a particular domain are often the very same skills necessary to evaluate competence in that domain” (p.30). More simply put, poor performers also have poor self-evaluation skills. As with all aspects of education, not all students enter university as adept learners with a high level of meta-cognitive capacity. However, this meta-cognitive proficiency can be improved through on-going training and feedback (Thiede, Anderson, & Therriault, 2003).

The CLAS workflow directly provides a self-monitoring and feedback strategy intended to hone student cognitive and meta-cognitive processes. CLAS allows learners to create defined point-based annotations and textual annotations on meaning and relevance, with the goal of encouraging learner self-reflection, benchmarking and collaborative opportunities. In the first instance, and as described earlier, learners have the option of reviewing and comparing their own flags and textual annotations with those of individual peers. With particular reference to textual annotations, the CLAS tool provides students with a corpus against which to compare and clarify their perception and understanding of key concepts in captured lectures (or other multi-media content).

In addition, CLAS develops aggregated group annotation metrics for further comparison. These are calculated by recording the frequency of individual annotations that occur in a particular time bin – currently 10 seconds in length – and dividing this by the total number of group members, giving a relative measure of perceived importance for each time segment of a lecture or resource. This group graph offers a consensus representation of the important elements in the media under consideration. CLAS then allows students to review their individual point based annotations against the aggregated group graph (Figure 4). While not implying that the group consensus is always ‘correct’ presentation of these data is intended to prompt student reflection on their individual input and understanding relative to that of the group. The creation of such a ‘feedback loop’ provides learners with a level of internal validation that is essential to self-monitoring, and also provides opportunities for external guidance from the instructor (who may also review individual performance and group norms).

For instructors, CLAS also provides data on the extent to which students review and alter their initial responses (point-based annotations). These captured data allow instructors to better track the outcomes of self-monitoring within their class(es). Records of frequency and timing of student actions upon self-reflection can serve as an indicator of development of meta-cognitive proficiency.

Overall, CLAS has been designed to capture, aggregate and re-present data to learners, creating opportunities for review, reflection and benchmarking that assist in shifting the responsibility of learning from instructor to learner, regardless of the pedagogical approach adopted in delivery of in-class lectures. The implementation of CLAS can actively encourage individual self-monitoring of learning progression, and can motivate students to alter their learning strategies in order to achieve their learning goals.

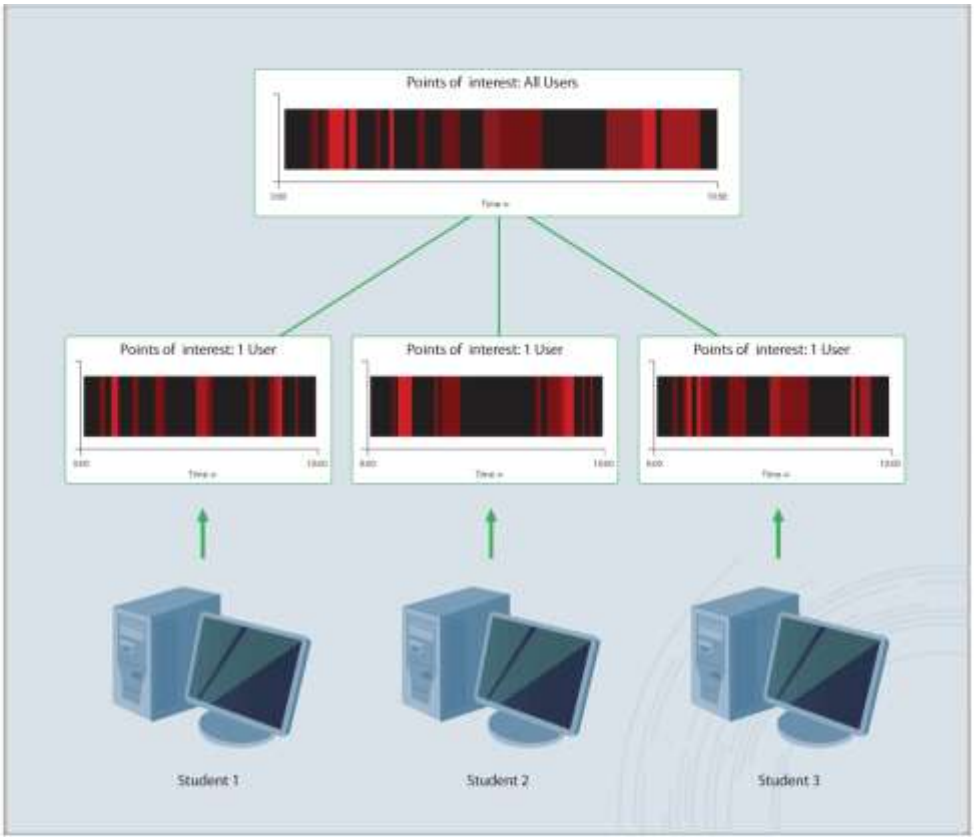

Figure 4: Relative measure of perceived importance for each video time segment.

Conclusion

The CLAS tool represents a starting point for leveraging existing teaching and learning practices to better promote and foster the necessary 21st Century skills within today's learning environments. Despite calls for changes to pedagogical practice to give new graduates the skills they need to become self-directed lifelong learners, the lecture remains the primary pedagogical approach in institutions of higher around the world. While technology adoption may have increased, there is scant indication that a pedagogical tipping point will be reached in the near future to dramatically change this transmissive model of education practice (Conole & Alevizou, 2010). This reality calls for the implementation of approaches that will allow learners to leverage 'traditional' lecture based instruction towards new ends. In this paper, we have outlined a technology that allows learners to annotate captured lectures and other multimedia content, and to share and reflect on these annotated learning resources as part of an enriched educational experience. The technology was developed with Garrison's (1997) multidimensional view of SDL in mind, and with the goal of creating – through the implementation of relatively simple technologies – opportunities for learners to build on lecture materials and develop skills necessary for self-directed learning (self-management, self-monitoring and motivation). Adoption of the CLAS tool is underway in a number of disciplinary areas in our institution, embedded in a variety of different course designs and activities. Ongoing research will seek to monitor and assess the impact of CLAS use on student learning and skills development.

Of great interest, also, is the learning analytics functionality of the CLAS tool, and the additional potential that it offers for students to take greater responsibility for their learning and for instructors to monitor the development of necessary SDL skills and evaluate areas of learning support and guidance. Within the field of learning analytics, the impact of giving data to learners (rather than simply to instructors and administrators) is in its infancy. Further empirical research is required to better understand the relationship between CLAS analytics and aspects such as student motivation, and meta-cognitive proficiency.

While presentation of learning analytics data may be significant for student motivation (as described above), the field of learning analytics also has much to offer educators in terms of predictive modeling and early identification of students requiring personalized learning support. By interrogating the data evolving from user interactions in various educational technologies it is possible to establish patterns of behavior and groupings of students based on lead indicators of academic performance. An understanding of the significant variables leading to high and low academic performance, may, in turn, permit early targeted learning support. Moreover, learning analytics data may allow assessment of student capacity and maturity for self-direct learning. This is hinted at by Biswas *et al.* (2010) who evaluated student self-regulated learning strategies through analysis of activity logs. Two important conclusions can be drawn from the Biswas *et al*. (2010) study. First, student application of self-regulated learning strategies is positively correlated with performance. Second, students employing (or not employing) specific learning approaches can be identified through analysis of activity log data. What this study and many others relating to learning analytics demonstrate is the capacity for student online interaction data to provide significant lead indicators of meta-cognitive skills (Biswas et al., 2010; Kinnebrew, Biswas, & Sulcer, 2010), academic performance (Finnegan, 2006; Macfadyen & Dawson, 2010) and learning support (Dawson, 2010). We anticipate that ongoing investigation of the learning analytics data generated by the CLAS tool and related applications will continue to expand our understanding of the utility of learning analytics data for supporting teaching and learning.

Can Digital Natives Level-Up in a Gamified Curriculum?

Penny de Byl
Bond University

The compulsion to include games and game related mechanism in education is great among educators who want to engage and motivate today's students and the latest buzzword in this domain is gamification. However, without a thorough understanding of what a gamified curriculum looks like, how it can best be applied and why it might engross students, it cannot be effectively applied. This research examined a gamified course curriculum structure and evaluated its use in two university level subjects. The objective was to gauge student enjoyment and engagement with a heavily gamified curriculum and to understand the aspects that make the practice useful in education. Exploratory factor analysis of the dataset revealed the possibility of a six dimensional model of curriculum gamification worthy of future study.

Keywords: gamification, curriculum, game-based learning, engagement.

Introduction

Computer game players willingly devote many hours problem-solving and honing their skills within the context of games (Gee 2003). McGonical (2011) supports this, citing studies in which players willingly spend between 17 and 22 hours per week in the massively multiplayer online game World of Warcraft. This amounts to some 50 billion collective hours in the game with players paying for the pleasure. McGonical calls this feeling blissful productivity. It is this blissful productivity in student behavior that is the holy grail of the educator. In an attempt to elicit this in students, educators are always seeking a new pedagogy or technology that might engage and immerse their students. Computer games became one of these foci when Prensky (2003) coined the term 'digital native' and promoted games-based learning as a playful way to engage the new generation of students who have grown up with games and technology. Sometime after the entertainment computer game boom in the 1980s, in the mid-1990s educators were getting excited about the potential of *edutainment* (Hogle, 1996) or *educational games* as a way of mixing the youth engaging technology of the day with educational content. The push for edutainment was mostly unsuccessful, due to a lack of foresight in both educators and game designers who thought the simply addition of educational content with existing game mechanics would *just work*. Following this in the mid-2000s *edutainment* matured into purpose built *serious games* (Sawyer, 2007) and quickly found their place in the military, health and business domains. Today, the latest buzzword surrounding the use of games for motivation and engagement is *gamification*.

It has been suggested gamification can also be used in the classroom to invigorate the curriculum with competition, leaderboards and other awards providing students with recognition resulting in positive work attitudes (EDUCAUSE 2011). However, it could be argued that these mechanisms are nothing that hasn't been used in the classroom and other training environments for many years. Using leaderboards, having in-class competitions and the giving out of rewards have been implemented by teachers for decades. The curriculum may not have been structured as gamification, under the current definition, however elements of it have always existed. Indeed gamification is an example of an extrinsic reward system; the pedagogical effects having long been the subject of vigorous debate (Bruner 1977). The points and reward systems of gamification are little more than a modern application of the token economy (Kazdin & Bootzin 1972). Token economies are applied for a wide variety of reasons usually for behavior management of psychiatric patients, school children and others. In the system, tokens are given out for good behavior and can be exchanged for rewards when enough are accumulated.

Sheldon (2011) describes the gamification of his classroom as a meta-world in which students have avatars, with personalized fantasy names, compete in teams named guilds, complete quizzes and exams (known as defeating monsters), do reading assignments (quests) and accumulate experience points (XP). The XP are exchanged for grades at the end of the semester. He aligns all of the normal classroom activities with terminology and tasks in typical role-playing games (RPG). Sheldon's work however, provides little analysis of the outcomes from teaching in this way other than student course evaluation surveys.

There has been much literature published in recent times pertaining to the use of gamification in the classroom inciting engagement among students. However, there is very little quantitative evidence describing or supporting its use. Furthermore, in addition to adding another playful layer atop the existing curriculum, it is not known if gamification helps or hinders student learning and progression. The motivations behind this study are two-fold. First it presents a simple gamified curriculum structure in response to the author's colleagues asking, "What does it look like?" The objective being to take an existing university level course and apply a points system to each and every student activity from attending lectures to working on assignments and taking exams. Second, it provides a preliminary analysis of student attitudes towards a gamified curriculum and suggests a possible quantified model based around student attitudes.

This paper begins with an examination of some popular gamification mechanics. Next, the curriculum designed for use in the study is presented. This is succeeded with an analysis of the curriculum's first use in two university level courses with respect to student attitude and course outcomes. Finally, suggestions for how gamification can enhance the curriculum and directions for future work are given.

Gamification Mechanics

The following list, while not exhaustive, is a set of the most popular strategies employed by games that have migrated across into other domains.

Points

People play games to earn points. The winner of a game is determined by comparing the total points of all players. Points are the rewards accumulated during gameplay when a player achieves a particular goal. Points can be found in use in the banking system in which customers are aligned to reward programs that allow for the accumulation of points for each dollar spent on a credit card. Frequent Flyer schemes, offered by airlines, are also an example of a point system.

Levels

Many computer games contain levels. A level represents a discrete subdivision, story chapter, a set of challenges or set of resources in a game world. Players progress from lower levels to higher levels through the collection of points. When the number of points reaches a set threshold, the player goes on to the next level. As a player progresses through the levels, they become harder. A player's character may also become more powerful as they ascend the levels. Moving from one level to another is known as leveling up.

Leaderboards

Keeping a list of high scores in a game is reminiscent of the old arcade and digital pinball machines that display a list of player nicknames and their scores proudly on the main display while the game is not being played. This leaderboard acts as a challenge to others while encouraging top scorers to keep playing in order to maintain their status.

Badges

Badges are the visible recognition of completed challenges. They exude status and provide recognition for positive effort. In games badges are given out when a player successfully completes an activity or gathers sufficient resources. According to Antin & Churchill (2011), badges have five purposes in social psychology. First, they assist players with goal-setting by revealing all the activities and challenges available in a particular system. Second, they encapsulate information about a player's interests and expertise providing others with summative knowledge about reputation and status. Third, badges affirm a player's status within the system as well as advertising it to others without explicit bragging. Next, they provide instruction about the types of challenges and activities available to a player by embodying the social norms of a system and exemplifying highly valued behaviors. Finally, badges bind a group of users together around a set of shared experiences by providing a sense of positive group identification.

Quests

In games a quest is a small challenge a player attempts as part of the larger game, taking players on a journey through gameplay and story narrative. Role-playing games are well known for having numerous quests. For example, in Bethesda's Skyrim the player can select from hundreds of quests. While the ultimate goal of the game is to determine why after so many years the dragons have returned to wreak havoc on the citizens of a mythical land, the players can take themselves off the main narrative track to explore dungeons and hunt down buried treasure to accumulate extra points. The player does not have to complete all the quests in Skyrim to complete the game, however, the quests give the player extra points and experience they would not otherwise have. Of course not all games structure quests in this way. Some quests are compulsory and some are not.

Social Engagement Loops

Another mechanism used frequently in gamified experiences is viral marketing. This method derives from what is called a social engagement loop. In this loop, a person is constantly engaged and reengaged with a core product. It begins with a motivating emotion that leads to re-engagement followed by a social call to action then a reward. The objective of the reward is to emotionally motivate and hence complete the loop. For example, the structure of YouTube exhibits a social engagement loop. A person connects by creating and uploading their own videos thus emotionally connecting them with the site. The person is reengaged when others start to recommend their video to others. The social call to action occurs through the ability to post comments on others videos and the rewards are by way of video ratings and channel subscribers. This in turn motivates more video uploads and the loop continues.

This is a brief examination of just some of the mechanics used in gamification and of all the mechanics the most likely few to seem familiar to educators. At first consideration one might think the education systems is already designed in a gamified manner. However, more in-depth analysis reveals some key differences.

Is Education Already Gamified?

Given the game mechanics outlined in the previous section it is not difficult to see how gamification and the education system align. Students receive points for completing assessments, levels based how these points add up at the end of the semester and are given a variety of badges and placed on leaderboards according to their academic success. Quests are the many challenges, problem-solving activities and assessment faced and social engagement is a natural part of being in a class. However, Smith-Robbins (2011) argues that if education is already gamified it is certainly a weak example. Education systems may be structured, on the surface, as a gamified experience, however they differ greatly as students can misunderstand the game they are playing. Gamified experiences are much more engaging as they make fully transparent the goals, points, status and levels. A player knows where they stand at all times and what they need to do next. In the education system, assessment items are not all weighted equal. Early assessment items are given lower weights assuming they require less subject knowledge to complete. Often final exams are worth extraordinarily large weights. In addition, the time and knowledge required to complete assessment items do not necessarily align with the individual marks given. Furthermore, one assignment worth 15% might be marked out of 100 while another assignment worth 25% might be marked out of 50. Compared with the transparency of a gamified points and level system, academic grading is confusing and overly complicated.

Another way in which education differs from gamification is in collaboration and competition. As Smith-Robbins (2011) eloquently states:

> If the goal [of education] is intellectual growth, then classmates and faculty are teammates. If the goal is to beat the system and earn more money, then classmates are competition and faculty are obstacles to be overcome.

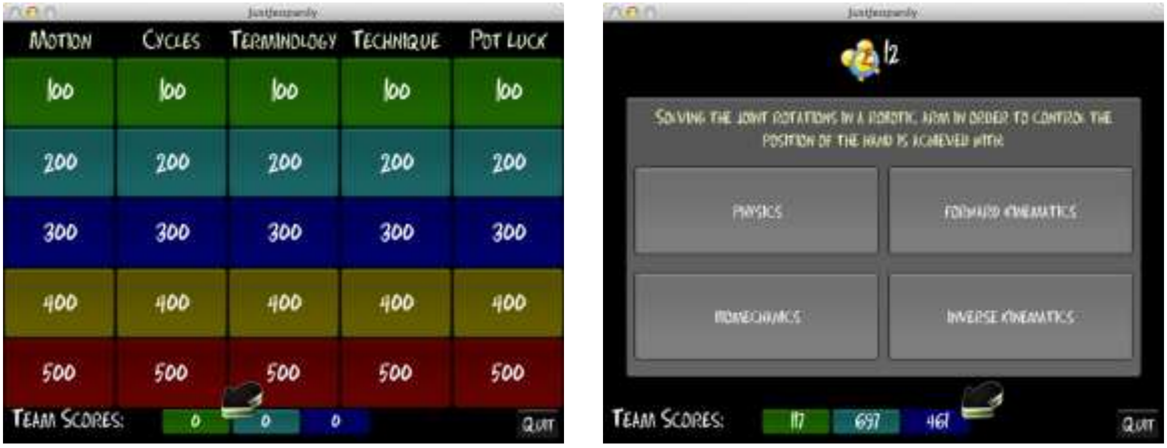
In many universities students are given final grades that must align with a bell curve. Numerous checks, balances and extra weights are often applied to ensure this is the case. This system places all classmates in the category of competition as their results are certain to impact on a student's position on the curve and it could mean the difference between failing or passing. In contrast however, a gamified experience places no such restrictions on players. It might be that player's scores form a bell curve, but player's are free to accrue points and level up irrespective of what other player's are doing. If gamification is to work in the classroom it should not add an extra layer of complexity over the top of existing grading systems. In addition, it should not cheapen the learning experience or trivialize the educational content. What follows is the outline of a gamified curriculum. The traditional assessment and marking system is dispensed with and all student activity allows for the accumulation of experience points (XP).

A Gamified Curriculum

For this study the curricula of two undergraduate subjects were restructured; Game Design and Logic (GAME11-140) and Animation (MMDE13-340), at Bond University, Australia. Grades and assessment weightings were replaced with XP, a weekly classroom team-based game of Jeopardy was added and a leaderboard integrated with the students' Blackboard logins. The assessment plan, breaking down every student activity into XP, was presented at the beginning of the semester. It included compulsory and non-compulsory items that attracted maximum possible totals of 525 and 300 XP respectively. Students were required to achieve at least 50% of the XP for each type in order to be considered for a passing grade. XP was attributed to each assessed item at a rate of 5 XP for every 2 hours of expected student effort.

Non-Compulsory Activities

Non-compulsory activities were only available for a week at a time. These included lecture and tutorial participation and theoretical and practical challenges. Students would pick and choose from the non-compulsory items throughout the semester. The XP attributed to the non-compulsory was assigned on a pass/fail basis in which a student completing the activity satisfactorily received the full XP. Non-satisfactory or no completion resulted in 0 XP. Each completed non-compulsory activity was worth 5 XP up to a maximum total of 300 XP. While it was possible for students to accumulate over this, they were informed it would always be rounded down to 300 as a maximum. Participation at lectures and tutorials also counted for XP. At the beginning of each lecture students were divided into small teams and a game of JustJeopardy, quiz software developed by the author, based on the television show Jeopardy, was played. A large game board, as shown in Figure 2, was projected onto the whiteboard and teams selected. The teams took turns picking and answering the questions for points. The questions contained in the game board were based on the content of the previous lecture. Every student received XP for playing and the winning team received a bonus 2 XP.



(a) (b)

Figure 2 JustJeopardy (a) The JustJeopardy game board showing categories along the top and coloured buttons for selecting a question. The numbers on the buttons indicate the number of points they are worth. The questions worth more points are believed to be more difficult, but not always. On selecting a button, the question appears as shown in (b). An answer is selected by clicking on the button with the chosen answer. The lecturer operates the game from a computer in the lecture room hooked up to a projector. As each team has a turn, the score appears across the bottom of the game board.

To achieve the XP for tutorial participation, students were required to turn up and complete the set activities for each session. This involved working on a step-by-step project with specialized software in the computer laboratory followed by a challenging applied task extending the project. The theoretical and practical questions were posted on Blackboard after the lecture and the deadline for the student's answers was before the lecture the next week. Theoretical questions required students to carry out research beyond content provided in the lecture and practical questions asked students to complete an applied exercise. The theoretical questions were made competitive in that they were posed to give more incentive to students completing them earlier. For example, after the lecture on the history of animation in MMDE13-340, students were asked to write a short biography on a technical pioneer of the animation industry who was not mentioned in the lecture. No two students were allowed to write about the same person. All student answers were posted into the same blog to ensure other students could see which pioneers had already been written about. Students posting first had the advantage of a larger pool of pioneers from which to select. The later a student left the exercise, the more they would have to research to find someone who had not been mentioned. Practical questions asked students to complete an activity using skills and knowledge obtained from the tutorials. For GAME11-140 it would be to program with specific algorithms explained in class or extend a given game program. For MMDE13-340 it included small 3D modeling or animation tasks.

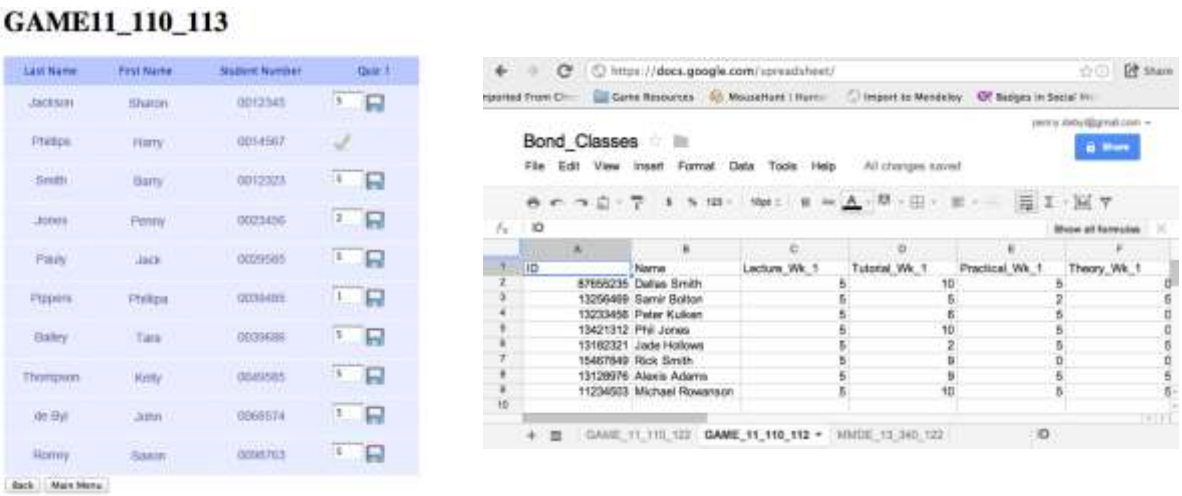
Just before the next lecture the questions were closed and students could no longer achieve these XP. From time to time, unbeknown to the students, some more challenging, non-compulsory questions included bonus XP. This would allow them to make up any previously missed XP due to missing a lecture, tutorial or question failure.

Compulsory Activities

The compulsory activities included assignments and exams the students had to attempt. For these, each had to be attempted and submitted for marking in order for the student to be considered for a passing grade. There were 3 assignments and 2 exams in each subject. The assignments were worth 25, 50 and 150 XP in turn. The mid semester exam was worth 100 XP and the final exam worth 200 XP. Each exam contained a theoretical and practical element. The theoretical part consisted of questions taken from the JustJeopardy game and the practical part involved students in a hands-on exercise to complete programming challenges or create 3D models and/or animations.

The Leaderboard

After each class, the lecturer and/or tutor would update a simple online database with the XP accumulated during the corresponding activity. The first iteration of the gamified curriculum used a teacher managed database and website for data entry as shown in Figure 3 (a). For the second iteration it was decided to introduce a freer and more intuitive format by way of a spreadsheet which the teacher did not have to self-manage. In this case, Google Docs was chosen as shown in Figure 3 (b). For the non-compulsory activities, updating the XP was a matter of selecting the item in the online form and clicking on the ticks next to the student's name. For compulsory items, the XP would be entered manually as it was possible for partial marks to be awarded.



(a) (b)

Figure 3 The web interfaces for the leaderboard database. (a) The original self managed interface and database, (b) The new version using Google Docs,

XP data going into the database would then be made instantly available on the student's leaderboard when they logged into Blackboard. The leaderboard, shown in Figure 4, is written in PHP and hosted on an external website. A short JavaScript program references it when the course homepage is loaded inside Blackboard. The student's Blackboard id is securely sent to the PHP program that extracts their XP from the database and draws the graph. The graph shows each student their total XP, the minimum, average and maximum for the class as well as the grade cutoffs. Students cannot see each other's totals.

Figure 4 The Leaderboard

Methodology

The study included two classes of undergraduate students enrolled GAME11-140 and MMDE13-340; 22 students in total. The classes were run with the exact same structure as outlined in the previous section. At the end of the semester all students were surveyed to establish the effect the course structure had on their engagement as well as address the gamification of education concerns of student patronization and over complication of learning and teaching. Many of the questions were inspired and adapted from the National Survey of Student Engagement (www.nsse.iub.edu). The survey consisted of 16 questions measured on a 5 point Likert scale: 1 = strongly agree, 2 = agree, 3 = neutral, 4 = disagree, and 5 = strongly disagree. Two items (indicated with * in Table 1) were reverse-coded to anchor positive attitudes in the same direction across all questions.

Results and Analysis

Internal consistency was assessed using Cronbach's α (e.g. Cronbach, 1951) on all 16 items resulting in acceptable internal consistency ($\alpha = 0.74$). To explore the dimensional structure of the survey, the items were examined for multidimensional scaling structure using exploratory factor analysis. An important issue affecting the quality of factor analysis, according to MacCallum et al. (1999) is overdetermination or the ratio of factors to variables. In this case, the ratio is 3.2. This meets with their requirements. However, this is an exploratory study and these results should be treated with caution. Nevertheless, they reveal a potential multidimensionality worthy of further exploration in future research. Consistent with the exploratory framework, Principle Components Factor Analysis was used with minimum Eigenvalues (EV) for each factor set at 1.0; Varimax Method was used to force orthogonal rotation so that individual survey items were forced onto unique factors. The loadings for this factor model are presented in Table 1.

Casewise deletion was unnecessary with this sample because all participants completed all items. Five factors were produced in 11 iterations using this method. Using face-validity, the following labels were assigned: Playfulness (EV=4.4, h2=0.28), Comparative Pedagogy (EV=3.0, h2=0.19), Instrumentalist (EV=2.0, h2=0.12), Status (EV=1.5, h2=0.09) and Performance (EV=1.1, h2=0.07). Subsequent internal consistency tests support the multidimensional structure. To reduce this number of variables for future studies and to adequately represent the domain exploratory factor analysis was undertaken. Emerging from the data were five scales; Playfulness (a = 0.79, items = 3), Comparative Pedagogy (a = 0.77, items = 4), Instrumentalist (a = 0.85, items = 3), Status (a = 0.67, items = 3) and Performance (a = 0.54, items = 3).

Table 1 Factor loadings for the factor analysis of the identified scales

Item	Playfulness	Comparative Pedagogy	Instrumentalist	Status	Performance	Mean (n = 21) 1= strongly agree	SD
1. I prefer the XP structure for grades in this class to the way grades are calculated in my other classes.		0.66				1.7	0.85
2. I prefer begin able to see my exact grade status on the XP chart on a day by day basis as opposed to not knowing what it is until the end of the semester				0.50		1.4	1.07
3. Getting XP for weekly theory and practical challenges made me do more out of class work for this course than my other traditionally run courses.		0.78				2.0	0.80
4. The structure of the course encouraged me to research and learn about related content I might not have otherwise explored.		0.58				2.1	0.85
5. I found the XP structure for course grading condescening. *			0.91 *			3.5	1.29
6. I would not mind my XP status being visible to other students. *				0.83 *		3.2	1.30
7. I prefer my XP status to be visible only to me.				0.82		2.3	1.35
8. I checked my XP status for this course more than I check mark/grade status in my other courses.		0.82				1.5	0.68
9. I found the weekly Jeopardy game useful in revising course content.	0.82					1.6	0.97
10. Getting weekly XP for the Jeopardy game encouraged me to turn up to class.	0.86					1.4	0.68
11. I felt the course structure added unnecessary complexity to the course distracting me from my studies.			0.88			3.5	0.98
12. The weekly Jeopardy game in class encouraged me to participate with other students.					0.54	1.7	0.72
13. I only do extra weekly exercises and study if I know it contributes directly to my grade.					0.59	2.2	0.93
14. I am only interested in passing the course. Any higher grade would be a bonus.			0.81			3.8	1.12
15. I want to get the highest grade possible.					0.75	2.0	1.07
16. The weekly Jeopardy game in class encouraged me to participate more in class than I usually would.	0.75					12.0	0.97

Discussion

An underlying problem with predicting whether a new pedagogical approach will be successful is largely due to an understanding of student attitudes, reaction and behaviour. Through an attempt to understand and in turn modify student behaviour, pedagogy can reach students on a whole new level. Gamification works because it addresses fundamental human desires such as reward, achievement, status and altruism. While these too are the needs of students there are also other elements within the student psyche that contribute to the level at which they are engaged and immersed in a curriculum. The analysis in this study has revealed five dimensions contributing to student responsiveness to a gamified curriculum; playfulness, comparative pedagogy, instrumentalist, status and performance.

A description of these five dimensions as it relates to the study follows:

- Dimension 1: Playfulness. These questions related to student attitudes toward the Jeopardy game used in classroom for content revision, attendance and class participation. The game brought the fun factor and friendly competition into the classroom. This factor accounted for most of the variance (28%). The question with the highest loading related to Jeopardy encouraging lecture attendance and the second using Jeopardy for revision. These questions appear to reflect the students' acceptance and motivation toward using games for learning and teaching.
- Dimension 2: Comparative Pedagogy. This factor suggests student interest and acceptance of other teaching methodologies. It accounted for 19% of the total variance. The relationship between curricula structure

appears to be characterised by the XP grading structure, how it motivated students to complete their homework and the checking of their total XP. The question loading highest on factor was "I checked my XP status for this course more than I check mark/grade status in my other courses."

- Dimension 3: Instrumentalist. This factor accounted for 12% of the variance. Loading highest on this factor was "I found the XP Structure for the course condescending." Followed by "I found the course structure added unnecessary complexity to the course distracting me from my studies." The third loading was "I am only interested in passing". All of these questions suggest the XP structure as instrumental in course progress.
- Dimension 4: Status. These questions relate to student grades and the visibility thereof. This factor accounted for 9% of the total variance. The highest loaded question on this factor was "I would not mind my XP status being visible to other students." followed by "I prefer my XP status to be visible only to me. " and "I prefer begin able to see my exact grade status on the XP chart on a day by day basis" respectively. This factor suggests student interest not only in their grade and standing in the class but also in having timely information about this status.
- Dimension 5: Performance. This factor suggests student attitudes to their overall performance in the class including class participation and completing homework. There are three loadings on this factor, the highest being "I want to get the highest grade possible." The second highest was "I only do extra weekly exercises and study if I know it contributes directly to my grade." followed by "The weekly Jeopardy game in class encouraged me to participate with other students."

It not unexpected that the major dimension revealed in this gamified domain is playfulness as this is the fundamental underlying principle upon which gamification is found and is very integral in learning environments, first eluded to by Plato (as cited by Pappas 2003) and reiterated by Prensky (2003). Play is not only for the digital natives, but is the essential mechanism through which human understanding develops. Play has been described as the motivation of choosing some rules in order to see what happens when you follow them and the freedom of choice behind them (Araya 2010). In the education system the rules are often difficult to ignore and not dictated by students. In this study however, the curriculum was designed to give students some freedom of choice on the activities that they chose to complete. The Jeopardy game was introduced to add an extra fun factor into the classroom. In the survey the students strongly agreed that the Jeopardy game encouraged them to come to class and helped them with revision. Although it, in itself, is not gamification, it did contribute to the students' XP each week. During one class, a team of students was so thrilled with their win that they stood up, took a photo of the projection of the game and score and posted it to Facebook.

As a dimension in a potential multidimensional model of gamified curriculum, at the two extremes of the Playfulness scale would be students who are very playful and those who are not. If gamification is assumed to be more effective on playful students then it might disengage those who are not. Furthermore, in considering what this dimension might mean learning styles should be examined. Playful learning is described across a variety of learning styles with different strategies for implementing play in each (Rice 2009). This would suggest all students in one way or another are playful. As the very aim of gamification is to engage those who wouldn't otherwise play games, it could be the nature of gamification itself teasing out the playfulness even in those who wouldn't otherwise participate in it. Despite the seemingly extrinsic nature of gamification, play itself is considered an experience with intrinsic motives (Henricks 1999). Hence, the nature of revealing Playfulness as a dimension of gamification suggests this reward system may provide students with acceptable mechanics keyed at deep and independent motivated learning.

If Prensky's (2003) digital native premise is generalized it could be said that educational materials deemed acceptable in the past now fail to engage students who are more attuned to high quality entertainment software, mobile devices and interactive multimedia. The comparative pedagogy factor may demonstrate that students are open to other pedagogical approaches. Although, there has been a large amount of literature criticizing typical lectures they remain the cornerstone of teaching practices at most educational institutions. The long history of technology use in education shows an inclination to use it in the same traditional manner as old technologies even with new media. This methodology neither produces change nor improves education. Gamification of the curriculum does not have the same barriers to implementation found with new technologies, as it is essentially the picking up and dusting off of the token economy. It can be applied without technology. In the questions relating to comparative pedagogy, students agreed with the premise that the gamified structure encouraged them to more out of class work. They also, strongly agreed to being more engaged in checking on the feedback for the activities they had been doing to achieve more XP. This could be due to the fact that every item of student participation in the class achieved XP in contrast to other courses and therefore they had daily and weekly opportunities to gather more XP. This also illustrates the social engagement loop at play with students challenged to submit work, receiving feedback and XP and being motivated to submit more work.

Comparative Pedagogy as a dimension could better help understand the usefulness of a gamified curriculum providing attitudes of students on learning and teaching structure on a scale from those students who thrive in a traditional classroom environment to those who prefer experimental and innovative pedagogy. This then raises the question that while a gamified curriculum may be novel now and effective for students who like experimental learning and teaching environments, what will occur when gamification becomes ‘old hat’? Strategies for course completion are also part of the curriculum that encourages student progression. Educators can motivate students by clearly communicating success criteria and depicting success as a realistic objective (Strong et al. 1995). The third factor in this study, Instrumentalist, may suggest student attitudes toward having a clear progression plan are significant. Gamification provides a transparent plan for students to follow breaking each activity down into equally weighted XP. In the curriculum presented herein, each XP equated to two hours of student effort. The students knew if they could demonstrate this effort they would receive points. For the questions constituting this factor, student responses imply the gamified meta-system did not add any unnecessary complexity to the curriculum, nor did they find it condescending. Although the results do not support it, gamification of the curriculum in this way, provides students with a clear step-by-step progression through the course from start to finish.

As a dimension, Instrumentalist would scale students from those who require extreme structure to those that can cope with flexibility and change. According to Skinner & Belmont (1993) teachers can deliver structure through clear communication of expectations, predictability and offering instrumental help and support. They also believe that structure is independent of allowing students autonomy and that high curriculum structure does not mean students do not have freedom of choice in their learning experiences. Autonomy in learning environments is considered to contribute to intrinsic motivation. As with the Playfulness dimension, a Instrumentalist dimension would provide further support to a debate against gamification being purely external. The accumulation and presentation of XP, as it is for the Instrumentalist factor, supports the fourth factor; Status. With the personalized leaderboard being generated whenever the student logs into Blackboard, they could clearly see their ranking in the class. Although other individual student XP was not displayed they could tell if they were the highest or lowest in the class. During one class, two students were comparing each other’s XP with one complaining the other had knocked them out of the top spot. The leaderboard also displayed, from the very first week of class, the final grade cutoffs. As students accumulated XP they could see their progress toward the grades. In this study students strongly agreed that they preferred seeing their current grade rather than having to wait until the end of semester. On the questions of whether students would dislike having their XP status currently displayed, the answers were neutral.

The final and most weak factor, performance, is also related to XP. Sadler (1989) argued that in order for students to succeed, they must know 1) what good performance is; 2) how their current performance rates with respect to good performance; and, 3) how to turn their current performance into good performance. Gamified systems make this information available giving players options of ways to gain more points and to reach higher levels. In an education system however, knowing how to better ones self is not that easy. Once an assignment has been completed, if the student receives a poor mark or even fails they do not often get the opportunity to retry for the marks. Indeed in the gamified curriculum presented herein, each weekly opportunity to gain experience points lapsed at the beginning of a new week and compulsory assessment items could only be attempted once. The question then beckons if students are being assessed on their timely abilities or their overall achievement of learning objectives. As Wormeli (2006) states:

> Grading policies such as refusing to accept late work, giving grades of zero, and refusing to allow students to redo their work may be intended as punishment for poor performance, but such policies will not really teach students to be accountable, and they provide very little useful information about students' mastery of the material.

In summary, all revealed factors suggest a strong linkage to the XP mechanic implemented in this curriculum structure. It provides a playful dynamic to the classroom enticing friendly competition and rivalry, it exposes the marking system, offers students goals for which to aim and provides rapid feedback on progression and class ranking. This component of gamification may be nothing more than a modern version of the token economy and with it will bring forth the many opponents of such extrinsic reward systems. On the other hand, it could address a deeper issue embedded into traditional education systems, laying bare the grading system, helping students make sense of it and providing a meaningful comparison of student cohorts from year to year.

Conclusions and Further Work

As the gamification craze inevitably finds its way into the classroom, the way in which it will impact on learning and teaching is also a concern. In an exploratory paper on Gamification in Education some apprehensions about reducing education to a points and levels system, albeit ironically, are raised (EDUCAUSE 2011). The idea of reorganizing classroom content as a game may trivialize the learning content. While students are left feeling patronized, unsatisfied by winning in these situations and that the course structure is too complex. The study herein goes some way to alleviating the before mentioned fears with respect to its implementation in the classroom. When used as a meta-structure atop existing curriculum it has the potential to engage and motivate students adding elements of play and transparency. This ensures the educational content is not compromised and students aimed at leveling-up do progress toward mastery of the key learning objectives.

The compulsion to include games and game related mechanism in education is great among educators who want to engage and motivate today's students. However, without a thorough understanding of what a gamified curriculum looks like, how it can best be applied and why it might engross students, it cannot be effective. To this end, the research herein, presents a gamified course curriculum structure and evaluation within two university level subjects. The objective being to gage student enjoyment and engagement with a heavily gamified curriculum as well as understanding the factors that may make the practice useful suggesting a multidimensional model of student attitudes that could assist in future gamified practices in education.
One of the assumptions of data reduction as performed on this study is that a large data set is available. However, herein, this is not the case. The data analysis presented is amazingly robust given the small sample size. This justifies further exploration through the data reduction of larger studies. Through additional study a multidimensional model of gamification in education will be proposed. As the research moves forward opportunities to extend the game mechanics within the curriculum will be explored. These will include giving student's earlier opportunities to level-up, giving them more choice on how XP can be achieved and improving the social feedback loop through peer observations and assessment.

Gamification affords the transparency and rapid feedback required to keep students motivated. It is the new token economy worthy of further investigation.

Using reward contingencies in online activities to facilitate engagement in a statistics class

Xochitl de la Piedad Garcia
Australian Catholic University

This paper presents the use of an online learning management system to establish a system of reward contingencies to facilitate student engagement in a statistics class. Based on a behaviourist framework, the proposed system uses immediate rewards for weekly studying. It also incorporates punishment to discourage breaking patterns of consistent weekly study. Student evaluations at the end of the semester showed students' acknowledgement that the system led them to study more frequently and consistently than they otherwise would have, and that the feedback made the study more effective. However, some students reported feeling that the punishment system was unfair. An alternative system is suggested in response to this criticism.

Keywords: Statistics teaching, Rewards, Elaborated feedback, Self-control.

Introduction

The current Australian Higher Education landscape, with the increasing number of incoming students resulting in large lecture sizes, poses a number of problems for the implementation of effective student engagement strategies into the future. Student engagement, defined as "the time, energy and resources that students devote to activities designed to enhance learning at university" (Krause, 2005, p. 3), has been shown to be correlated with positive outcomes, not only academically, but also in terms of student satisfaction (Kuh, 2007). It is well understood that a student's baseline level of academic preparation upon entering university is also positively correlated with engagement and success. However, it is important to note that this baseline academic preparation does not only consist of the knowledge of basic subjects, but that it also includes the "study habits and behavioral patterns" (Kuh, 2007, p. 4) that will be associated with success at university.

Krause (2005) reports that in 2004, first year university students in an Australian sample reported devoting a mere 11 hours per week to study outside the classroom. Given the same students reported having an average of 16 contact hours per week, the reported amount of study time is in stark contrast to the idea that students should spend around two hours of study for every hour of class time (Krause, 2005). The reduced amount of time devoted to study may in part be due to a lack of training or understanding of the kinds of activities that constitute study for a particular subject. While it is common practice to give students lists of required readings and other exercises, the relatively small number of hours devoted to independent study is an indication that students are not engaging with the material in the expected manner.

Having students who do not devote the expected amount of consistent weekly effort (as measured by study time) to their university units is particularly problematic in the case of units for which the initial level of motivation is low. This is the case of units such a statistics for behavioural sciences (e.g., Bude et al., 2007; Wiberg, 2009), where motivation has been found to be an important predictor of achievement (e.g., Tremblay, Gardner, & Heipel, 2000). It is important to note that the effect of motivation on achievement in statistics courses for non-statisticians has been found to be mediated by behavioural factors such as persistence and emotional factors such as finding statistics enjoyable or interesting (Bude, et al., 2007). Thus, motivational operations that may increase the likelihood of students engaging in study behaviours may lead to increase engagement and, in turn, achievement. The research on the ways in which statistics can be rendered more interesting and enjoyable has been extensive (for a review, see Zieffler, et al., 2008). However, there do not seem to be as many documented efforts towards establishing persistent study patterns that may facilitate students' engagement with the subject matter. It is possible that the assumption that students will be or should be motivated enough, at an intrinsic level, to engage in independent study is incorrect. From a behaviourist perspective, it is possible to train students to engage in regular and consistent study practices by establishing reward contingencies that support precisely those behaviours (Mazur, 2009).

In a behavioural framework, every behavior is believed to be the result of a choice. That is, every time we are about to do something, we can be said to be facing a choice, at the very least, between performing that behaviour and not performing it. Each of these courses of action is associated with particular consequences, and each of those consequences can be characterized in terms of features that make them more or less preferred, such as the consequence's magnitude, its probability, immediacy, etc. The combination of these features determines the subjective value of the rewards and, in doing so, affects our preferences and, in turn, our choices. The basic assumption of these models of choice is that the decision maker will always maximize value (e.g. Rachlin, 1995). That is, the agent, at every point, actively chooses the most preferred course of action given the circumstances. Behaviours that lead to more preferred consequences (or rewards), will be chosen more often than behaviours that lead to less preferred consequences (or rewards).

This characterisation of the environment has been useful in the study of self-control dilemmas. In this framework, a self-control dilemma can be characterised by the choice between a smaller immediate reward and a large delayed reward. This choice is said to pose a dilemma when the preference for an immediate small reward is at odds with the long term pattern of behaviour required to obtain the delayed larger reward (Rachlin, 2000). For example, in the context of studying in a first year statistics for behavioural sciences unit, students can be considered to be facing repeated choices between studying and not studying. For students who do not typically engage in studying, one can assume that studying is less preferred to not studying (which is why they do not engage in frequent studying on the first place). However, the mere fact that they have enrolled in the unit means that, at the very least, the student must prefer passing the unit to failing it. These two sets of preferences are at odds with each other (hence, the dilemma). If at every point when the choice is available, the student follows their preference for not studying, they are unlikely to attain the long term reward of success in the unit. Like the dieter who must avoid the chocolate which is preferred right now in order to be thin in the long run, the student must avoid the pleasantries of doing things other than study if they want to be successful in the unit in the long run. If this is a correct characterisation of students' choices, the introduction of immediate rewards for smaller routine study-related tasks should facilitate students' engagement in those behaviours (making them more immediately attractive than before). Current online learning management systems (OLMS) provide a unique opportunity to introduce some such measures. This is because they facilitate the delivery of working exercises on a frequent basis even in classes involving large cohorts of students. Further, OLMS also facilitate the provision of fairly detailed feedback for performance, which has also been shown to be correlated with engagement (Kuh, 2007) and which is likely to increase preference.

In the present paper, I present an initial attempt at establishing a set of contingencies aimed to increase the likelihood and consistency with which students in a statistics unit engaged in study behaviors (keeping up with readings and lecture notes). This was achieved via the delivery of weekly online exercises (OEs) consisting of multiple choice questions on the topics covered each week in class. In particular, the OEs were designed so that students received immediate, detailed feedback on their responses. Further, the program included contingencies that reinforced regular weekly work. The program presented here was developed in an attempt to (a) increase the frequency of study behavior and (b) provide students with detailed feedback on their learning.

A program of incentives for studying

The first year statistics unit for students enrolled in psychology degrees at the Australian Catholic University is an introductory statistics unit covering basic concepts of measurement, data display, and descriptive as well as some inferential statistics (e.g. t-tests and correlation). The unit in its present form was first taught in Semester 2, 2011 and had an enrolment of 232 students. It consists of two hours of lecture time per week plus one hour of tutorial time. Attendance at lectures is required for all students, but is not monitored. The tutorial sessions take place in groups of 25 to 27 students and involve activities in which student participation is required. Students in this unit had a final exam at the end of the semester. In addition, they submitted a written assignment.

To encourage students to study consistently during the semester, ten weekly OEs, consisting of 20 multiple choice questions, were introduced in week 3. The questions required students to understand statistical concepts and the relationships between them (e.g. the inverse relationship between standard error and sample size), and to apply them to simple problems. Immediately after the student submitted their answer to a question, they were told whether their answer was correct or incorrect and provided with detailed feedback on the reasons why that was the case. This form of feedback (i.e., elaborated feedback, see Dempsey, Driscoll, & Swindell, 1993), has been shown to facilitate deeper conceptual understanding (Bangert-Drowns, Kulick, Kulick, & Morgan, 1991).

Online exercises opened every week at the same time and closed exactly seven days later. Students were allowed to complete the OE any time during that seven day period from any computer with access to the university's OLMS. Students were encouraged to make use of the book and the lecture notes while completing these exercises, as it was emphasized that the purpose of the exercises was to encourage study. Each OE was worth up to two points towards the final mark in the unit. Strict rules were in place for the establishment of a regular and consistent study pattern. First, students had to complete the exercise during the week that it was available. If they did not complete it during that seven-day period, they could no longer have access to it (other than for study purposes at the end of the semester). Second, in order to ensure that students kept up with the material, a system of rewards was introduced such that in order for students to have access to a weekly exercise they had to have completed the previous one in time (i.e. if a student missed one exercise, they did not have access to any of the subsequent weekly exercises). Third, to avoid chance performance, students had to answer at least six questions correctly to get any points. Students were told the rules of the OE system at the beginning of the semester. These rules were explained in detail during the first two lectures and the first two tutorial sessions, before exercises were introduced. In addition to this, on Tuesday, Thursday and Saturday of every week, students who had not yet completed that week's exercise were sent an email reminder that the exercise would close on Sunday.

Outcomes

The average student performance across the ten weekly OEs was M=60.86 (SD=10.35). Further, and not surprisingly, average performance in the OEs was significantly correlated with the final exam mark, r=.35, n=205, p<.001. Figure 1 shows information relative to the percentages of students missing completion of the exercises every week. Note that every week a very small proportion of students missed the exercise relative to the number of students who could have completed it (open circles). This, of course, results in an increase in the cumulative number of students who had missed an exercise (closed circles). When looking at the open circles, note that the first point is fairly high (almost 10%) but the line flattens and remains low at around 4% until exercise number nine, at which point it increases (to 8.9%). Further, the highest point in that line is the point for the last exercise, for which 16.9% of students who were eligible to complete it, missed it. This result supports the usefulness of the contingencies that were introduced regarding the sequencing of exercises, as at that point the consequences of missing an exercise are not as severe as at the beginning.

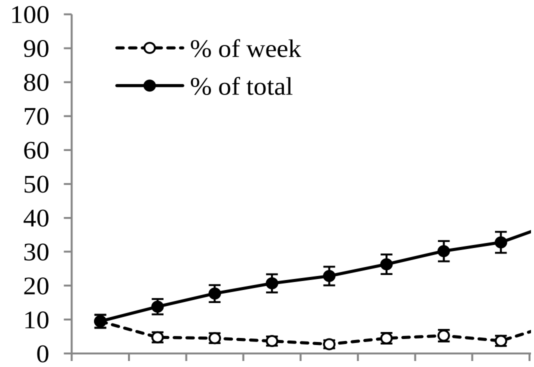

Figure 1: Percentage of students who missed an online for every week it was available (± one SE). Open circles represent the percentage of students who missed the exercise each week; closed circles represent the cumulative percentage of students having missed exercises each week.

During the unit evaluations (which consist of a series of standard Likert scale items), students were encouraged to provide additional written feedback regarding the OEs. Of the 50 students who made any references to the OEs, 31 had positive comments and 19, negative comments. All negative comments referred to the fact that the contingency was believed to be unfair. Positive comments included three main types of content, namely (a) those that stated finding the exercises useful because they "forced" them to study, (b) those that pointed out that the feedback had been useful and (c) those that made explicit reference to both criteria.

Conclusions

The present paper presents an initial attempt to establish a system of reward contingencies that encourages students to partake in regular, consistent study practices. It is important to note that the purpose of this program was not to assess performance per se, but to provide students with the opportunity to (a) track their own progress, (b) motivate study and engagement with the relevant material on a weekly basis, and (c) provide opportunities for the students to understand how to focus their study. Given that this unit, in its present form, was running for the first time when this intervention took place, there are no baseline data to compare it to. However, the students' reflections show that students are aware of the fact that the contingencies, "forced them" to engage in weekly study. Specifically, they note that these activities led them not only to read the book and their notes, but to do this in the context of the completion of a specific task. Second, in noting that the exercises "forced them" to study, students are also acknowledging that this is not the behaviour they would have necessarily chosen to engage in had these contingencies not been in place. Finally, students' comments also show that the provision of detailed feedback, allowed students to better direct their learning and, in their own words, understand what was wrong about an incorrect answer.

On the other hand, the implemented program also led to complaints and displeasure regarding the punishment associated with the missing of an exercise. Students who, after having missed one exercise, missed all the subsequent ones, believed this to be an unfair system. In response to this criticism, the strict reward contingencies will be removed next time the unit is taught. It will be interesting to examine the effect of this change on study behaviour and exercise completion rates, as well as on the final performance of students in the unit. Alternative systems of reward contingencies for the purpose of encouraging engagement in the unit are also possible. In particular, it is possible to develop a system in which students get rewards for every completed exercise but also get a bonus cumulative reward for the number of weekly exercises successfully completed in sequence (i.e., without omissions). This alternative system would not only provide an immediate reward for the performance of each individual weekly exercise, but it would also provide rewards for the consistent long-term pattern of study behaviour (rather than providing punishment for breaking the pattern).

The adoption of a behaviourist framework could provide part of the answer for the issue of student engagement, understood as "the time, energy and resources that students devote to activities designed to enhance learning at university" (Krause, 2005, p. 3). The present paper does not attempt to claim that this type of interventions would have an effect on intrinsic motivation, as this was not the focus of the intervention. Rather, the claim is that if the interventions increase engagement in effective study practices, they will have effects in learning outcomes. The OLMS currently used by all universities in Australia and abroad provide a unique opportunity to implement this kind of contingency programs in the future. This is because they facilitate the management and delivery of such programs in classes with a large number of enrolled students. In doing so, they may provide with an opportunity to facilitate student engagement. Whether these would in turn lead to changes in attitudes towards statistics and feelings of self-efficacy over the long-term or not, remains an empirical question.

Building teacher educator TPACK: Developing leaders as a catalyst for change in ICT Education

Helen Doyle
University of New England

Christine Reading
University of New England

Teacher educators with TPACK are critical to the development of the ICT competence of the next generation of teachers. To effect real change in ICT education leaders must be developed amongst teacher educators as well as teachers. An Australian university implemented a supported program of professional development for teacher educators as they implemented innovative ICT-rich practice. This paper reports on data collected before, during and after the process to inform planning. Areas identified where teacher educator TPACK was lacking were used to inform the professional development process. For a variety of ICT competences teacher educators were generally convinced of the usefulness but not so convinced of their own confidence. Enablers of learning identified by teacher educators, who had engaged in innovative practice, showed that they were building TPACK that would equip them to be leaders and thus catalysts for change in ICT education.

Keywords: TPACK; teacher educator; leader; competence; ICT education; change catalyst; TTF

Introduction

The current focus on ICT in education makes it a necessity that all teachers develop their competence in this area. This is equally applicable for teachers at all levels of education, thus teacher educators need to develop these competences to model best practice for future teachers. Part of the challenge in ICT education is having catalysts to inspire the change that is necessary. Important catalysts for such change are technology leaders but transformation of ICT education only occurs these leaders are involved with pedagogy and learning (Tan, 2010). This paper reports on the building of teacher educator Technological Pedagogical Content Knowledge (TPACK) (Mishra & Koehler, 2006b) at an Australian regional university in an attempt to develop leaders who can be catalysts for change within the delivery of teacher education. In a climate of change in education it is critical to identify competences that can be used to inform the process of developing leaders. Through awareness raising and targeted professional development, teacher educators at the institution were supported in implementing innovative ICT-rich teaching. This helped to build their TPACK and thus, as leaders, contribute to changes in the way that ICT education is addressed. Data is reported that was collected to inform the process and effect change.

A climate of change

Education is undeniably immersed in a climate of change. In the last two decades education has moved from a focus on the 3Rs, reading, writing and arithmetic, to include Information and Communication Technology (ICT). ICT in education, or ICTE (E for Education), now refers to what was previously called Information Technologies (IT) in education. The term IT was believed to place too much emphasis on technical skills and not enough on the cognitive skills needed to be ICT literate (ICT Literacy Panel, 2007). While communication with peers and accessing information are frequent uses of ICT, there has been less frequent use of ICT that involves creating, analysing or transforming information (MCYEETA, 2007). Changed expectations are evident in the ICT Literacy definition: "using digital technology, communications tools, and/or networks to access, manage, integrate, evaluate, and create information in order to function in a knowledge society" (ICT Literacy Panel, 2007, p. 2).

The teacher is one of the driving forces contributing to change, a process influenced by both the school organisation and the local environment (ten Brummelhuis & Kuiper, 2008). Desire to integrate ICT into their teaching is not sufficient to effect this change, teachers also need confidence and competence (Bingimalas, 2009).The impact of those driving forces can be viewed through Finger and Russell's (2005) two cyclical modes of influence on ICT adoption in schools: societal expectations and government policy.

Societal expectations are that Australian students will leave school with the necessary skills and knowledges that will allow them to take their place in the community as confident and productive users of ICT who understand the impact of ICT on society (MCYEETA, 2007). Such expectations are not restricted to Australia. For example, Katz (2005) explained that in the United States of America (USA) society expects that college leavers have skills in researching and communicating via technology to enable them to function in society. Societal expectations have been a catalyst for governments to review, develop and implement policies pertaining to ICT in education.

Public policy has developed to the extent that the implementation of ICT in education has become a key component of election campaigns. Election promises have included putting computers on every student's desk from Year 9-12 and grants for schools (public and independent) to upgrade their ICT infrastructure and/or hardware. The *Digital Education Revolution* (Department of Education, 2008), implemented following a successful election campaign, committed to: new computer equipment in secondary schools; the rollout of *National Broadband Network;* and increased access to online content. After the Australian Government recognised the need to train teachers to teach using these new technologies, a follow-up initiative, the *Teaching Teachers for the Future* (TTF) project (http://www.ttf.edu.au/), was implemented to enable pre-service teachers to increase their level of proficiency in ICTE. Training pre-service teachers was considered to be more effective than training existing teachers, many of whom are either resistant to change (Watson, 2006) or within ten years of retiring (Owen, Kos, & McKenzie, 2008). Teacher educators with sufficient TPACK were essential to the TTF project.

To effectively build teacher educator TPACK, and to measure the achieved levels of knowledges, some guidance is required as to what competences are necessary. There is limited literature available specifically on teacher educator TPACK but as teacher educators are teachers the literature on teacher competence in ICT education is considered relevant. In the quest to develop leaders amongst the teacher educators it is also necessary to investigate literature on leader competence in ICT education.

Teacher competence in ICT education

Teacher competence in ICT education has been defined as "a collection of knowledge, skills, understandings and attitudes that are inextricably bound up with context and pedagogy" (Webb & Downes, 2003, p. 2), just being able to perform basic computer functions (skills) is no longer sufficient as ICT competence for teachers. Since then ICT knowledges have been clarified by Wen and Shih (2008) as encompassing explaining, organising, analysing, assessing and synthesising. While ICT skills are relatively easy to measure, the testing of cognitively-related ICT knowledges is more difficult and makes the articulation of teacher competence in ICT education more challenging. To date there has been no internationally recognised test of ICT knowledges that measures the ICT competent individual (Perez & Murray, 2010)**.** However four frameworks for assessing teacher competence in ICT education, which have been developed and used, are now presented.

First, the *ICT skills test*, developed by the Department for Education (United Kingdom), tested pre-service teacher ICT competencies. This was a mandatory component of teacher qualification but has since been abolished "as new teachers have greater abilities in ICT than they had 10 years ago" (Department for Education, 2012)**.** Such skills-based tests only measure ICT skills (Lim, Chai, & Churchill, 2010) and not ICT literacy, that is, the ability for teachers to use ICT actively, collaboratively and constructively.

Second, the *ICT Literacy Assessment*, launched in the USA in 2005 by the Educational Testing Service (ETS), measured ICT proficiency, cognitive proficiency and technical proficiency (ICT Literacy Panel, 2007). This assessment was designed to support initiatives to improve ICT literacy on college campuses and involves simulations of authentic technology environments in which critical-thinking skills must be used to perform tasks (ETS, 2004). The *ICT Literacy Assessment* is now called the *iSkills* assessment.

Third, an instrument to assess teacher *Technological Pedagogical Content Knowledges* (TPACK), has been developed by Mishra and Koehler (2006a). The TPACK framework (Figure 1), has been used by many institutions and projects, including the TTF project, as a self-audit survey of teacher, teacher educator and pre-service teacher TPACK (Schmidt et al., 2009). The survey, and its many adaptations, aim to measure teacher knowledge of content, knowledge of pedagogy and knowledge of technology and the various intersections of these knowledges.

Fourth, the *ICT Elaborations* (AITSL, 2011b) were designed as a framework to assist pre-service teachers to provide evidence of their ICT-based practice as aligned with the Australian *National Professional Standards for Teachers* (AITSL, 2011a) when applying for accreditation. The development of this framework was based on the TPACK framework. Thus far these elaborations have only been developed for the graduate teacher level and not for the proficient, highly accomplished or lead levels.

Comparing these four frameworks, it has become clear that since the *ICT skills test* was developed more than a decade ago the description of teacher competence in ICT education has placed a much stronger focus on cognitively-related aspects of using ICT. While the above frameworks describe certain competences necessary for all teachers there are further competences teachers need to be leaders in ICT education. The frameworks described above did not articulate different levels of competence. Following is a consideration of frameworks that describe levels of competence in an attempt to identify what is important in leader competence in ICT education.

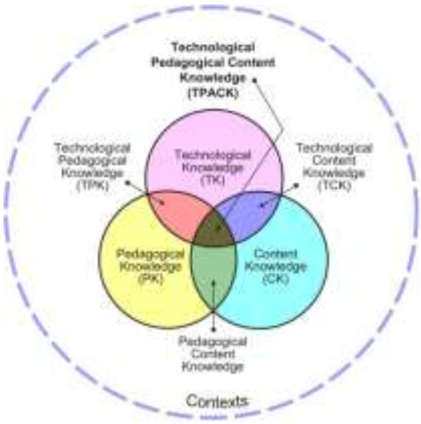

Figure 1: TPACK framework and its knowledge components (Mishra & Koehler, 2006a)

Leader competence in ICT education

What makes a leader competent in ICT education? There has been little research in this area and to date there has been no definition of leader competence in ICT education published although one study in Australian schools in 2002 investigated school principals as ICT leaders (Tan, 2010). However, some researchers and organisations have worked towards describing underpinning principles for a framework to identify an ICT competent leader. These are considered below to assist in identifying key competences necessary to be a leader in ICT education.

In 2002 the *Raising the Standards* project published a proposal for the development of an ICT competency framework for teachers, as ICT had the unrealised “potential to transform how, what, where and why students learn what they do” (DETYA, 2002, p. 3). This was the first framework to include leader as a stage in the development of ICT competence. The Dimensions of ICT use (Figure 2) show four stages of ICT development; *Minimum*; *Developmental*; *Innovator* and *Leader*. Four aspects of the proposal are of interest to defining leader competence. First, the clarification of the difference between the Innovator and the Leader stages of ICT development. For Innovator, the dimension of ICT use indicates an impact on how students learn and what they learn, while for Leader the dimension indicates impact on the organisation and the structure of schooling itself. Second, the target groups for the Leader stage include teacher educators as well as school leaders and educational leaders. This is one of the few times that teacher educators have been explicitly included in competence documents and that teacher educators are therefore expected to be leaders. Third, the descriptions of two of the key groups, school leaders and teacher educators, makes it clear that teacher educators have a further responsibility to inform their own practice and to provide effective role modeling for the pre-service teachers. Fourth, practicing teachers who are highly accomplished users of ICT are distinguished from school leaders in the descriptions of the key groups. The expectation is that a school leader fosters appropriate role modeling and develops a vision to support staff, policies and structures to ensure that ICT education is realised.

Dimensions of ICT Use	Stages of ICT Development	Target Groups
ICT as a tool for use across the curriculum or in separate subjects where the emphasis is on the development of ICT-related skills, knowledge, processes and attitudes.	Minimum	Underpins all teaching practice in the same way as other literature
ICT as a tool for learning to enhance students' learning outcomes with the existing curriculum and existing learning processes	Developmental	For beginning teachers and practicing teachers beginning to use ICTs
ICT as an integral component of broader curricular reforms that change not only how students learn but what they learn	Innovator	For practicing teachers who are accomplished/highly accomplished users of ICT
ICT as an integral component of the reforms that alter the organisation and structure of schooling itself	Leader	For school and educational leaders and for teacher educators

Figure 2: Dimensions of ICT Use (DETYA, 2002, p. 21)

A *Lead* level of competence was also distinguished from a *Highly Accomplished* level in the *National Professional Standards for Teachers* (AITSL, 2011a), in particular for ICT competence in Focus area 2.6 *Information and Communication Technology* (ICT). The highly accomplished level of competence expects teachers to “model high-level teaching knowledge and skills and work with colleagues to use current ICT to improve their teaching practice and make content relevant and meaningful” (p. 11), whereas the lead level of competence expects teachers to “lead and support colleagues within the school to select and use ICT with effective teaching strategies to expand learning opportunities and content knowledge for all students” (p. 11). This is similar to the expectation in the *Raising the Standards* proposal.

An empirical study of school technology leadership research allowed Tan (2010) to identify eight major knowledges, skills and attribute areas for technology leader competence: leadership and visioning; learning and teaching; productivity and professional practice; support, management and operations; assessment and evaluation; knowledge of problem solving and information technologies; social, legal and ethical issues; organisational relations and communications. Whilst these have been important areas of competence there is no indication of what these would look like at a leader level. Of these eight areas which cover similar competences to teaching standard frameworks, there are two which do not appear at levels below leadership. These are: leadership and visioning; and support, management and operations, both of which involve engagement at the institutional level and not necessarily at the classroom level.

So, what does leader competence (LC) look like in ICT education? The following set of seven competences was developed from the above analysis of leader competence. First, a leader must have achieved the ICT competence standards for teachers at a highly accomplished or innovator level. This provides three relevant competences: LC1- integrate technology with content and pedagogy (TPACK) to impact on how students learn and what they learn; LC2 - model high-level ICT-rich teaching knowledge and skills; and LC3 - collaborate with colleagues to use current and innovative ICT to improve their teaching practice and make content relevant and meaningful to expand learning opportunities for all students. Then there are four further competences which would only be expected of leaders: LC4 - foster appropriate role modeling of ICT-rich teaching knowledge and skills; LC5 - contribute to the operation of the organisation to facilitate ICT-rich learning; LC6 - contribute to the development of a vision to support staff, policies and structures to ensure that ICT education is realised; and LC7 – take responsibility to inform their own practice.

This set of competences is proposed as a framework to inform the development of leaders in ICT education in any educational institution. It should be noted that leadership qualities can be exhibited without being in an official leadership position. This proposed framework, combined with the TPACK framework, underpinned the research-facilitated development of teacher educator TPACK and teacher educators as potential leaders in ICT education at the University of New England.

Context

Teacher education at the University of New England is delivered by academics in the School of Education (SoE). The research being reported was undertaken during 2011 when the SoE had 79 non-sessional academic staff and more than 2600 students. A major rewrite of the SoE awards to address Australian Curriculum (ACARA, 2012) requirements and to reconfigure the placement of professional experiences provided an ideal opportunity to also consider the place of ICT Education and to address the lack of explicit teaching of TPACK. This process was supported by the SoE participation in the national *Teaching Teachers for the Future* (TTF) project that aimed to improve delivery of teacher education so that graduating pre-service teachers were able to demonstrate effective and innovative use of ICT in education.

The TTF project targeted the four Australian Curriculum areas, English, Mathematics, Science and History, with each of the 41 institutions involved being expected to implement strategies in two of the four areas. Although UNE focused on Science and Mathematics as their "designated" curriculum areas, work was also undertaken in English and History. Teacher educators were provided with support, an ICT Pedagogy Officer (ICTPO), as they planned, implemented and evaluated innovative ICT-rich learning experiences for the pre-service teachers. For the designated curriculum areas, there was a higher level of innovativeness in ICT inclusion and of ICTPO support uptake. For more detail see Reading and Doyle (2012).

Study

As a major component of their commitment to the TTF project, the SoE worked towards building the TPACK of their teacher educators. The progress of this knowledge building was tracked through the collection of data at three critical phases in the process: Phase 1 *Mapping of Pre-service Teacher Education Units*; Phase 2 *Teacher Educator TPACK Survey*; and Phase 3 *Teacher Educator Most Significant Change Stories*. As well as the three data collection phases, there was an intervention in the form of professional development and support for the teacher educators. The research reported in this paper covers all three phases, Phase 2 in detail and the other phases in summary form as the detail has been reported previously, Phase 1 in Reading and Doyle (2011) and Phase 3 in Reading and Doyle (2012).

Phase 1 aimed to clarify what was currently being done in existing units in relation to ICT use in the delivery of content and to the teaching of TPACK. This was designed to clarify that there was an issue in relation to what the teacher educators were delivering in the undergraduate units offered. The intervention, throughout 2011, involved provision of professional development and support for the SoE teacher educators, especially through the ICTPO. This included personalised support for the teacher educators in the four targeted-curriculum areas and more general group-level support for those in other teaching areas. Phase 2 aimed at measuring the TPACK of the teacher educators to inform planning for both professional development and rewriting of units. This data collection, undertaken during the intervention, was designed to show the magnitude of the issue. Phase 3 aimed to study the four cases of the teacher educators who had been the main focus of the intervention. This data collection, undertaken after the intervention, was designed to capture detail of the significant changes that had occurred, from those most directly involved in the intervention.

Methodology

Phase 1 collected data in May 2011 from the unit descriptions and unit coordinators. The mapping was completed across eight criteria that covered two perspectives*: ICT aspects of Unit Delivery*, with the criteria, Curriculum, Pedagogy, Assessment and Resources; and *ICT Knowledges*, with the criteria, Technological Knowledge (TK), Technological Content Knowledge (TCK), Technological Pedagogical Knowledge (TPK), and Technological Pedagogical Content Knowledge (TPACK). Each criterion was scored at one of four levels: Undeveloped, Fundamental, Proficient and Innovative, as defined by Lim et al. (2010).

Phase 2 was designed in close alignment with the survey completed by the pre-service teachers as part of the national TTF project (ESA, 2012) and was similar to other surveys developed for such purpose (e.g., Schmidt et al., 2009). The survey included demographic items and likert-scale items related to a variety of aspects of the use of, and teaching with and about, ICT. The wording of these questions is included in the figures provided in the results sections. All teacher educators in the SoE were invited to complete the survey online.

Phase 3 was designed to follow the Most Significant Change Story protocol provided by the TTF project (ESA, 2012). In each of the four curriculum areas two-page stories were created, from focus group discussions, about the learning that took place as the teacher educators changed their thinking about ICT whilst undertaking the implementation of innovative ICT in teaching. Identified enablers of learning were categorised as either exogenous (non-manipulative) or endogenous (manipulative) and the endogenous enablers were further categorised as associated with contextual learning, active learning, social learning or reflective learning.

Results

Phase 1 Mapping of Pre-service Teacher Education Units

The mapping involved 13 pre-service teacher education awards with 125 different units and 51 unit coordinators. Generally teacher educators were better at using ICT to deliver the curriculum than addressing ICT Knowledges within the curriculum. Occurrences of proficient and innovative levels of practice are reported as these provide a benchmark for identifying potential leaders. Teacher educators provided a variety of reasons why they were not teaching about ICT and not using ICT to support teaching but did state that were keen to learn new ICT skills; appreciated resources suggested by pre-service teachers; lacked time to learn due to excessive workload; and needed help with ICT skills.

There was proficient use of ICT in the support of pedagogy and provision of ICT tools as part of the resources in many units. The use of ICT in assessment occurred mostly at the fundamental level. For many units where ICT use was addressed in the delivery, there was a sustainability issue because this was not described well in the curriculum documents. An innovative level of ICT use only occurred in three units and this was spread across pedagogy, assessment and resources.

Proficient teaching about TK only occurred in two units and when less proficient teaching occurred it was often achieved through the requirement to use ICT rather than explicit teaching of ICT skills. Proficient teaching about TCK was evidenced in units teaching about specific curriculum areas, especially Mathematics, Science and English. Teaching TPK was evidenced in very few units and not at the proficient level. Teaching about TPACK that transforms learning was only evident in a few units and even then only at a fundamental level. An innovative level only occurred in three units, and was across the TK, TCK and TPK criteria.

Phase 2 Teacher Educator TPACK Survey

There were 29 respondents from a possible 102 teacher educators. Demographic data collected indicated that they were representative of the SoE academic staff with: 20 female and 9 male; and an concentration of age with 22 between 50 and 59 years old; only 2 less than 50 years; and 5 more than 59 years.

The data is reported as teacher educator (TE) use of ICT (Tables 1 to 3) and TE support of pre-service teacher (PST) use of ICT (Tables 4 to 6). As there were only 29 respondents, the likert-scale items (from 0 to 6 for confident/useful level) have been summarised to reflect how *Confident (C)* as any response at a level of 3 or greater (i.e., moderately confident to extremely confident) and, similarly, how *Useful (U)* as any response at a level of 3 or greater. A count of less than 20 (out of 29) is considered less than satisfactory. Those not represented in these counts were either less confident/useful or unable to judge. Generally the number *unable to judge* is low but where it is above 3 (approximately 10% of 29, considered a reasonable limit) the result is indicated in the relevant table.

Table 1 shows the number of respondents who indicated confident/useful to competences in relation to TE use of ICT in professional knowledge. This clearly shows that while the TEs believed these competences were useful, they were not yet confident in their own abilities. A clear lack of confidence exists in: personalising learning activities, in particular for Aboriginal and Torres Strait Islander PSTs.

Table 1: Teacher educator use of ICT in professional knowledge

(n=29 respondents)	C*	U**
demonstrate knowledge of the range of ICT to engage pre-service teachers	21	25
teach strategies that are responsive to pre-service teachers diverse backgrounds	21	25
teach strategies that are responsive to pre-service teachers learning styles	20	25
teach strategies to support pre-service teachers from Aboriginal and Torres Strait Islander backgrounds	14	25
teach strategies to personalise learning activities for pre-service teachers	19	26
access, record, manage, and analyse pre-service teachers assessment data	24	28
teach specific subject areas in creative ways	23	28
engage with colleagues to improve professional practice	25	27
collaborate for professional purposes, such as online professional communities	23	27

* How *confident* are you that you have the knowledge, skills and abilities to use ICT to…
** How *useful* do you consider it will be for you, as an academic, to be able to use ICT to…

Table 2 shows the number who indicated confident/useful to competences in relation to TE use of ICT in professional practice. Again, this clearly shows that while the TEs believed these competences were useful, they were not yet confident in their own abilities. A clear lack of confidence exists in: demonstrate how ICT can be used to support literacy learning; demonstrating how ICT can be used to support numeracy learning; designing ICT activities that enable PSTs to become active participants in their own learning; and evaluating how ICT use has helped to achieve specific subject area goals.

Table 3 shows the number who indicated confident/useful to competences in relation to TE use of ICT in professional engagement. Although useful was low for a couple of competences, it is still clear that the TEs believed these competences were useful but they were not yet confident in their own abilities. A lack of confidence exists in: manage challenging pre-service teachers behaviour by encouraging the responsible use of ICT; and being aware of digital citizenship to promote pre-service teacher demonstration of rights and responsibilities in using digital resources and tools.

Table 4 shows the number who indicated confident/useful to competences in relation to TE support of PST use of ICT in professional knowledge. Again, useful was high but it is still clear that the TEs believed these competences were useful and that they were not yet confident in their own abilities. The only competence that demonstrated reasonable confidence was in being able to support PSTs to use ICT to provide motivation for curriculum tasks and to demonstrate what they have learned.

Table 5 shows the number who indicated confident/useful to competences in relation to TE support of PST use of ICT in professional practice. The TEs believed these competences were useful but they were not yet confident in their own abilities. There was no competence where the TE demonstrated reasonable confidence.

Table 2: Teacher educator use of ICT in professional practice

(n=29 respondents)	C*	U**
design learning sequences, lesson plans and assessment that incorporate ICT use by pre-service teachers	23	26
select and organise digital content and resources	22	28
use ICT for reporting purposes	24	27
demonstrate how ICT can be used to support literacy learning	19	26
demonstrate how ICT can be used to support numeracy learning	17	23
design ICT activities that enable pre-service teachers to become active participants in their own learning	18	28
select and use a variety of digital media and formats to communicate information	21	29
evaluate how ICT use has helped to achieve specific subject area goals	19	25

* How *confident* are you that you have the knowledge, skills and abilities to use ICT to…
** How *useful* do you consider it is for you, as an academic, to be able to use ICT to…

Table 3: Teacher educator use of ICT in professional engagement

(n=29 respondents)	C*	U**
manage challenging pre-service teachers behaviour by encouraging the responsible use of ICT	19[1]	21[2]
be aware of digital citizenship to promote pre-service teacher demonstration of rights and responsibilities in using digital resources and tools	18[3]	23
demonstrate an understanding of safe, legal and ethical use of digital information and technologies	20	25
identify personal and professional learning goals in relation to using ICT	21	26
reflect on relevant ICT research to inform professional practice	23	27
use a range of ICT resources and devices for professional purposes	24	27

* How *confident* are you that you have the knowledge, skills and abilities to use ICT to…
** How *useful* do you consider it will be for you, as an academic, to be able to use ICT to…
[1] 7 unable to judge; [2] 4 unable to judge; [3] 4 unable to judge

Table 4: Teacher educator support of pre-service teacher use of ICT in professional knowledge

(n=28 respondents)	C*	U**
provide motivation for curriculum tasks	20	24
develop functional competencies in a specified curriculum area	17	22
actively construct knowledge that integrates curriculum areas	19	23
actively construct their own knowledge in collaboration with their peers and others	19	23
analyse their knowledge	18	23
synthesise their knowledge	19	24
demonstrate what they have learned	21	24
acquire the knowledge, skills, abilities and attitudes to deal with on-going technological change	17	24

* How *confident* are you that you have the knowledge, skills and abilities to support pre-service teachers' use of ICT to…
** How *useful* do you consider it will be for you, as an academic, to ensure pre-service teachers use ICT to…

Table 6 shows the number who indicated confident/useful to competences in relation to TE support of PST use of ICT in professional engagement. Again, the TEs believed these competences were useful but they were not yet confident in their own abilities. The only competence that demonstrated reasonable confidence was in being able to support PSTs to gather information and communicate with a known audience.

Phase 3 Teacher Educator Most Significant Change Stories

The four stories, one for each of Science, Mathematics, English and History, provided interesting insight into the experiences, and related enablers of learning, of the teacher educators as they developed innovative practice in ICT-rich education. Of most interest are the 18 endogenous enablers (Table 7) identified because these can be manipulated to optimise teacher educator learning. Context appears to have impacted on responses from the teacher educators. One example is the teacher educator who became involved in the experience through personal interest and demonstrated strong awareness of the impact of Social Learning and Reflective Learning enablers. Another example is the teacher educators who worked most collaboratively with the ICTPO clearly and demonstrated a strong focus on pre-service teacher learning, including pre-service teacher capabilities and enthusiasm, rather than their own learning.

Table 5: Teacher educator support of pre-service teacher use of ICT in professional practice

(n=28 respondents)	C*	U**
integrate different media to create appropriate products	16	23
develop deep understanding about a topic of interest relevant to the curriculum area/s being studied	17	21
support elements of the learning process	19	24
develop understanding of the world	18	22
plan and/or manage curriculum projects	19	23
engage in sustained involvement with curriculum activities	18	23
undertake formative and/or summative assessment	17	26
engage in independent learning through access to education at a time, place and pace of their own choosing	19	24

* How *confident* are you that you have the knowledge, skills and abilities to support pre-service teachers' use of ICT to…
** How *useful* do you consider it will be for you, as an academic, to ensure pre-service teachers use ICT to…

Table 6: Teacher educator support of pre-service teacher use of ICT in professional commitment

(n=28 respondents)	C*	U**
gain intercultural understanding	17	23
acquire awareness of the global implications of ICT-based technologies on society	18	22
communicate with others locally and globally	19	22
understand and participate in the changing knowledge economy	19	22
critically evaluate their own and society's values	17	21
facilitate the integration of curriculum areas to construct multidisciplinary knowledge	18	24
engage in sustained involvement with curriculum activities	17[1]	22
critically interpret and evaluate the worth of ICT-based content for specific subjects	16	24
gather information and communicate with a known audience	21	25

* How confident are you that you have the knowledge, skills and abilities to support pre-service teachers' use of ICT to…

** How *useful* do you consider it will be for you, as an academic, to ensure pre-service teachers use ICT to…

[1] 4 unable to judge

Table 7: Endogenous enablers of teacher educator learning (about ICT in education)

Contextual Learning	have a personal interest; participate in webinars; raise awareness through ICTPO contact; recognise potential of use of ICT for learning
Active Learning	learn in the workplace; teach in a unit with ICT embedded; utilise technical support; utilise ICTPO support; identify with ICTPO as mentor
Social Learning	collaborate with ICTPO; collaborate with others; learn together through teaching together; learn together with pre-service teachers; become part of a learning community
Reflective Learning	ask colleagues for ideas; challenged by others; change perspective on ICT use in education; change view of lecturer & pre-service teacher relationship

Discussion

Based on the framework of Leader Competences (LCs) developed, the mapping and the TPACK survey indicated that there were few innovators in ICT education amongst the teacher educators in the SoE at UNE and potentially only one leader. This provided a challenge for those tasked with developing leaders to be catalysts for change in ICT education. First, innovators had to be nurtured and then with prolonged engagement came the hope that some of them would develop into leaders. These first two phases provided detailed information about TPACK in teaching and learning and identification of aspects where improvement was needed. The intervention to support teacher educators was designed specifically to address three of the recommendations that came from the mapping: ICT Knowledges be incorporated into all units, enthusiasm for new ICTs be nurtured amongst teacher educators; and ICT innovation be reconceptualised for teacher educators. The survey showed teacher educators agreed that most competences listed were useful but the general lack of confidence in their competence helps to explain why the teacher educators were not using ICT more widely or more innovatively in their practice, as shown by the lack of proficient and innovative practice in the mapping. The survey also showed that the teacher educators were more confident in the use of ICT to deliver their units, i.e., their own TPACK, than in teaching about ICT knowledges, i.e., helping the pre-service teachers develop their TPACK.

In the intervention, the teacher educators in the designated curriculum areas were especially encouraged to develop their TPACK (i.e., LC1), model teaching with ICTs (i.e., LC2) and to collaborate with colleagues (i.e., LC3) and thus operate at an innovative level. The intervention was designed to provide the opportunity to research practice (i.e., LC7), which was embraced by the Science, Mathematics and English teacher educators. Those in Science also fostered appropriate role modeling (i.e., LC4) by teaching in a virtual world where the pre-service teachers would also teach. The teacher educator change stories made it clear that they were collaborating with colleagues (i.e., LC3) and changing their perspective on ICT education (i.e., ready for LC6).

Conclusion

Awareness-raising through the mapping and survey, together with the professional development offered to all members of the SoE, has helped to build teacher educator TPACK at UNE. While positive steps have been made towards the development of leaders they do not yet exhibit all the necessary competences of leaders in ICT education. However, these potential leaders are already catalysts for change. Since the completion of the project some of these teacher educators have continued to develop their competence, for example, in English two more teacher educators became role models for their pre-service teachers with the encouragement of the teacher educator directly involved in the project (i.e., LC4).

There are two main limitations to this study. First, the low number of survey respondents, 29 out of 102, together with a high concentration of respondents in the age category 50 to 59 years, means that the confidence levels reported may not be truly reflective of the SoE. Second, the survey was a self-audit of ICT knowledges and self-audits have been shown in the past to generally show a higher level than actual performance (see, e.g., Braddlee & Mathews-DeNatale, 2006).

This study has implications for both teaching and research. The UNE SoE created an action plan to further the work begun by the TTF project in building teacher educator TPACK. This plan especially encourages actions to assist more teacher educators to become leaders in ICT education and thus catalysts for change. Already, some are requesting assistance to develop their own TPACK and incorporate TPACK in their teaching. Other institutions could use the proposed leader competence framework (LCs) to inform the progression of their teacher educators towards leader competence in ICT education. Obvious implications for research are to: develop a more formal description of leader competence in ICT education; and develop alternatives to self-audits for reporting TPACK. All teacher education institutions should continue to build teacher educator TPACK so that more leaders are developed to be catalysts in this ICT education climate of change.

Applying a Reverse Induction Process for Improved Definition of Higher Education Technology-Supported Research Projects

Joanne Doyle
Australian Digital Futures Institute
University of Southern Queensland

Helen Farley
Australian Digital Futures Institute
University of Southern Queensland

Scoping out the detail of a Higher Education research project can be a time-consuming and frustrating experience. The excitement of a research project is frequently stifled by the tedious process of mapping out project activities, estimating required resources and developing project schedules.
Reverse induction provides a fresh approach to defining technology-supported research projects. In much the same way as new product development must be guided by an understanding of customer needs, reverse induction focuses on research outcomes before formulating research aims. Using a systematic process of backward reasoning, researchers can define a project concept in a structured and efficient manner. There is significant potential for reverse induction to deliver time and cost savings in a complex and challenging Higher Education environment.

Keywords: project management, technology, learning

Background

Academics are struggling to manage existing workloads, and almost 30% of academics have either a long-term or a short-term intention to move to an academic position in another country (Bexley, James & Arkoudis, 2011). One of the reasons contributing to academic job dissatisfaction is insufficient funding for research. Research undertaken at the University of Melbourne indicates that almost half of academics surveyed (49.1%) are not confident that they can get research grants.

Graves, Barnett and Clarke (2011) have estimated that the average amount of time spent on preparing each research application submitted to the National Health and Medical Research Council in 2009 was 22 days, and the average cost of preparing each application was $17,744. Once an application is submitted, the assessment process is costly and subject to a high degree of randomness owing to variation in panel members' assessments. The relatively poor reliability in scoring by panels is to be expected given the complexity of the assessment task and the subjective nature of the assessment process.

In the case of technology-supported research projects, defining a project concept can be particularly challenging:
- Are the project outcomes applicable to one type of technology or a range of different technologies?
- Does the project seek to enhance technology-supported learning outcomes for the student or teacher or both?
- How do you demonstrate the sustainability of project outcomes when the technology itself may be obsolete within a short period of time?

If researchers can minimise the time required to scope out a Higher Education technology-supported research project, they can prepare and submit a greater number of funding applications, increasing their chances of funding success.

Overview of reverse induction

Reverse induction, or backward induction, is the process of reasoning backwards in time to determine a sequence of optimal actions. Backward induction is considered to be a more complex but efficient procedure than a (forward) exploration strategy (Seyed-Allaei, Amati & Shallice, 2010).

Marketing was an early discipline to apply the principles of reverse induction. Marketing focuses on consumer needs as the best route to product development (Kotler, 1972). "Given the customer's needs, the industry develops backwards, first concerning itself with the physical delivery of customer satisfactions" (Levitt, 1960).

Marketing myopia and the ‘better mousetrap’ fallacy are avoided by identifying consumer needs and developing a product that satisfies those needs.

Reverse induction is also used in game theory to solve finite sequential games. The iterative process starts with determining the optimal strategy of the player who makes the last move of the game. The optimal action of the next-to-last moving player is determined taking the last player’s action as given. The process continues backwards until all the players’ actions have been determined (Shor, 2005).

Defining Higher Education research projects

Traditional technique of defining research projects

The traditional technique for defining research projects starts with the research aim. The researcher then specifies each activity necessary to achieve the research aim. The research outcomes evolve during the process and with some minor manipulation, the research aim and outcomes can be aligned with funding scheme priorities. If not, the researcher will need to identify an alternative funding scheme, or make further adjustments to the research aim, outcomes, and activities (refer to Figure 1).

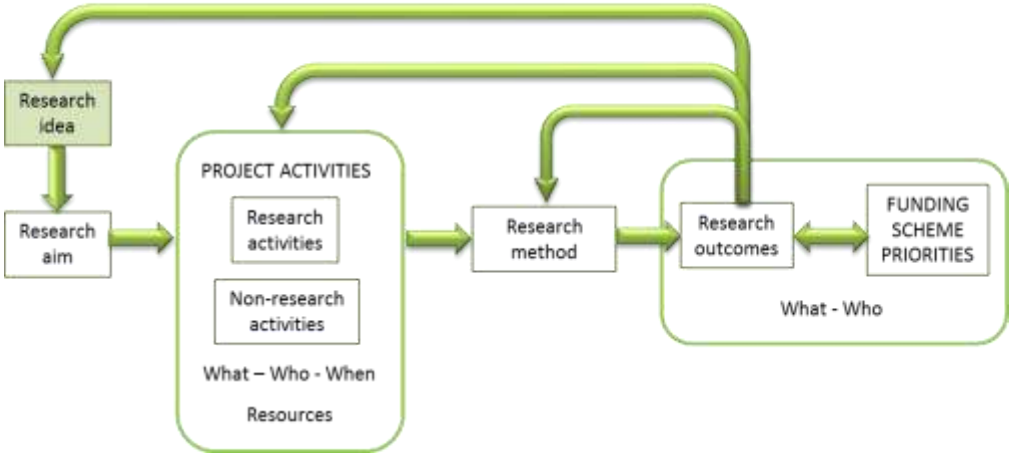

Figure 1: Traditional technique for defining technology-supported research projects

Reverse induction for improved definition of research projects

Reverse induction, as it applies to project definition, is the process of backward reasoning, whereby the optimal process for a technology-supported research project is achieved by starting with the research outcomes. By focusing on the research outcomes, and working backwards to the project aim and objectives, academics will be able to define research projects in a more structured and time-efficient manner (refer to Figure 2).

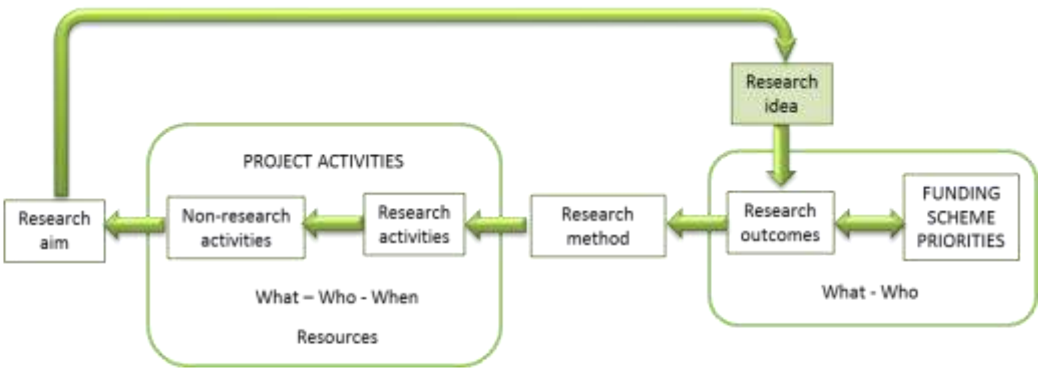

Figure 2: Reverse induction technique for defining technology-supported research projects

At each stage of the reverse induction process, activities are identified as outlined in Table 1.

Table 1: Activities identified at each stage of the reverse induction process

Research idea	Articulate an initial project concept. This should be a broad overview of the research project. It should not be a detailed explanation of the anticipated research aims or outcomes, but an overarching statement of the research intention.
Research outcomes	Detail specific outcomes in terms of what will be developed/produced and who will benefit (the sector, the institution, leaners, teachers, etc). These should be broadly aligned with relevant funding scheme priorities. CHECKPOINT: Do the research outcomes match the funding scheme criteria?
Research method	Provide an explanation of the method that will be used to generate the outcomes – the focus is on the most appropriate choice of research. Options may include action based research, design based research, etc. CHECKPOINT: Is the research method appropriate for the research outcomes?
Research activities	Provide details of the specific research activities that need to be undertaken. Options may include focus groups, surveys, etc. Research activities must be aligned with the research methodology and be able to justify the research outcomes. CHECKPOINT: Are the research activities aligned with the research methodology? CHECKPOINT: Will the research activities enable the research outcomes to be achieved?
Non-research activities	Provide details of all the non-research activities that need to be undertaken to support the research activities – developing the surveys, trialing the surveys, determining method of selecting research participants, arranging focus groups, ethics clearance, etc. Each activity will have resources allocated to it ($, people, place, etc) Identify all other non-research project activities (establishment of legal agreements, purchasing activities, etc) and allocate resources. CHECKPOINT: Are the project activities (research and non-research) sufficient to enable the research project to be undertaken?
Research aims	Review the research methodology and research activities. Develop a research aim based on the research activities, methodology and outcomes. CHECKPOINT: Are the research aims aligned with the research outcomes? If there is any discrepancy, review the research outcomes and adjust them. Check that the funding scheme criteria are still being met.

The cyclical nature of the process enables the initial research idea and research outcomes to be adjusted to align with the emergent research aim.

At all times, the focus is on research – project activities are secondary. The premise of the backward induction technique is that if you can accurately determine the research outcomes, activities and aim, the project will be better defined to reflect the true work required. Superfluous activities are minimized.

Early results

Since early 2012, the reverse induction technique has been trialed at the Australian Digital Futures Institute. The process has proven to be an effective approach for scoping out technology-supported research projects in the areas of electronic publishing, mobile learning and multiple-channel delivery of Higher Education content.

In one particular case, an Early Career Researcher used the reverse induction technique to efficiently isolate the research aim and clarify the research proposal. By following the process, and focusing on research outcomes rather than project activities, the researcher was able to synthesise his initial research idea into a condensed and precise research aim. This was a vast improvement on the vague and overwhelming project concept originally articulated (refer to Figure 3).

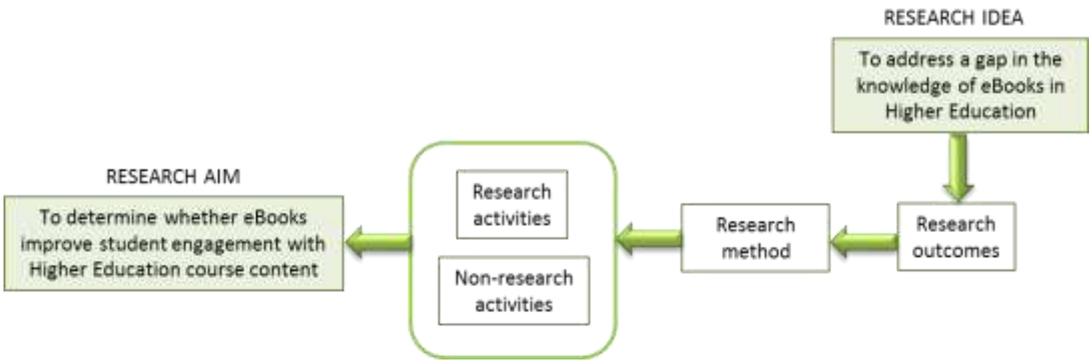

Figure 3: Improved articulation of research aim using reverse induction

Although difficult to quantify savings, it is estimated that the process of mapping out a technology-supported research project using reverse induction achieves a 40% reduction in time over traditional processes for defining projects.

Further trials of the reverse induction technique will continue throughout 2012/2013 to provide a better understanding of comparative time and cost savings against funding success rates.

Conclusion

This paper is about applying a reverse induction technique to define Higher Education technology-supported research projects. Reverse induction is a backwards mapping approach that can be used to streamline the scoping of research projects. The approach uses research outcomes as a starting point which is in contrast to the traditional activity-focused technique of mapping projects. The research activities and research aim evolve during the mapping process, and because they are outcome-focused there is little need to re-work the project scope to match funding opportunities. Early results of this technique are encouraging. The simple yet structured approach is proving to be a time-efficient process for researchers to define technology-supported research projects.

Using a blogging tool to assess online discussions: an integrated assessment approach

Xinni Du
Learning and Teaching Unit (LTU)
University of New South Wales

Chris Daly
School of Mining Engineering
University of New South Wales

This paper presents a summary of an experimental assessment design in a fully online undergraduate course. It details a task design relating to assessing discussion forum contributions and how lessons learnt from the original design have impacted on the current course design. From a task that often resulted in 2500 posts across a semester – impossible to read and assess in a fair and equitable manner to the combined design offered today. The task is equitable and manageable with the aim of building students' capability as active learners.

Keywords: online discussion, blog, peer review, self review, assessment strategy

Online discussion forums have been widely used to support learning and teaching activities in Higher Education. Today, educators are more aware of the varied affordances of online discussions, in particular, the opportunities they offer to build students' knowledge and capacities for the future, such as digital literacy, communication skills, critical and reflective thinking skills. While some teachers focus on how to engage and motivate students to participate in online discussions, the course, which will be reported in the paper, faced a new challenge – the unexpected high online participation volume posed threat to desired learning goals and the fairness of marking.

When current task design cannot meet the requirements of learning and teaching, changes to the assessment are expected to take place in order to effectively improve students' learning experience and, meanwhile, keep the task manageable and sustainable. Advices on task design and assessment strategies for online discussions are made available by experienced teachers and educators. Strategies that are focused on student-centred learning have been reported as successful in practice, including having students as moderators (Ashcroft & McAlpine, 2004) and encouraging students to nominate their posts based on given criteria (Wozniak & Silveira, 2004). Rubrics are adopted to facilitate a well informed and effectively communicated learning and assessing process, which include the use of informative marking rubrics (Nandi, Chang & Balbo, 2009), performance based clarifications for assessing effectiveness of contributions (Edelstein, & Edwards, 2002), criterion-based discussion assessment (McNamara & Burton, 2010) and the adoption of holistic and analytic scoring tools (Hazari, 2004). It is also strongly recommended that interactions should not be the only focus when designing an online discussion task. Tasks that facilitate cognitive presence are more likely to encourage students to adopt deep learning strategies (Garrison & Cleveland-Innes, 2005).

By combining what were recommended in the literature and what needed to be addressed in practice, a new assessment design was developed. It is to build a learning task that is equitable and manageable with the aim of building students' capability as active learners.

Background

Undergraduate students at the University of New South Wales are required to complete two General Education courses as an integral part of their studies. The courses must be taken externally to the student's Faculty. The purpose of this requirement is to encourage students to expand their learning beyond their chosen discipline and take a more flexible and active role in their own education. The General Education course discussed in this paper is offered by the School of Mining Engineering. The rationale for this course is to provide a broad overview of the impact mining has had on the Australian physical, social and economic environment. It targets students from diverse academic backgrounds, who are interested in mining but have little or no prior knowledge of the topic.

The course was one of the first General Education courses to be offered fully online, first via WebCT and later via Blackboard over a period of 12 weeks. Currently, it runs three times per year with an average enrolment of 150 students in each semester. Apart from current teaching materials, the course offers stimulating learning activities, ranging from multimedia learning modules, class polls, online discussions, group projects to quizzes and essays, for both formative and summative purposes. Online discussion is undertaken throughout the semester and is attributed 15% of the total assessment mark. The extensive use of online discussion facilities is to address the following aligned learning outcomes across all the General Education courses:

- To enable students to evaluate arguments and information
- To provide structured opportunities for students from disparate disciplines to interact co-operatively within a learning situation
- To provide an environment in which students are able to experience the benefits of moving beyond the knowledge boundaries of a single discipline and explore cross and interdisciplinary connections.

In addition, online discussion provides the opportunity for students to form an online learning community through the promotion of student engagement in evidence-based discussion and debate.

Each week, students are given a specific topic to discuss. Instead of relying on personal beliefs or opinions based on the popular media, students are expected to post their considered understandings and evidence-supported opinions on the forum. It is envisaged that material posted on the forum will stimulate interest in researching a topic to a greater extent, leading to the development of the final writing task that requires students to demonstrate their research skills, skills of filtering fact from opinion and writing skills.

Soon after the course was introduced in the online format, students' contributions for the discussion were much greater than expected. Both students' intrinsic interests in a General Education subject and the controversial nature of many mining topics - for example, questions like *would you support electricity generation from Nuclear Power being developed in Australia?* – contributed to heated lengthy discussions. It was soon discovered that this course could have in the vicinity of 2,500 posts over the period of the 12-week semester. This inevitably led to another question – how could teachers fairly and efficiently assess the large volume of student discussions?

Issues associated with the original assessment design

Originally, the assessment strategy involved allocation of a participation mark based on quantity of posts, which acted as a replacement for a tutorial attendance sheet in the face-to-face learning environment. Later, it switched focus from the quantity of students' contributions to the quality. Specifically, students were required to contribute at least ten meaningful and evidence-based posts across the semester. Marking criteria were made available to students at the beginning of the semester.

There were two major issues that arose from this model of assessment. The first issue was related to marking load. Due to resource constraints, only one lecturer was responsible for marking all the assessment tasks. The lecturer spent enormous time and effort on locating each individual student's contributions and then skim-reading the discussion thread in order to make an academic judgment on the quality of the post. Due to the growing volume of posts and conflicted marking time with the final essay task, the marking process for the discussion task became unmanageable. At times, the lecturer had no choice but to delay the release of marks, which resulted in student complaints.

The second issue was related to an uneven distribution in the quality of students' discussions. Some students rushed into the discussion board in the later stages of the course and posted to meet the minimum requirements of the assessment task, instead of engaging in meaningful and considered discussion. Some students still posted opinions from anecdotal experiences or used simple expressions to merely agree or disagree, rather than engage with the thread post. In some cases students made excessive posts, in the hope that the lecturer would go through their work and identify the best posts. This issue was not only identified by the lecturer but also observed by fellow students who reported it in their course satisfaction survey.

New assessment design and its pedagogical and managerial benefits

The new two-step approach aims to foster an *assessment as learning* environment in which students gain autonomy and take initiative. Criteria on quality of discussions are used as scaffolds that are designed to improve students' understandings and performance rather than rules for awarding or deducting marks. Instead of presenting everything they have done and waiting passively for the lecturer to select and mark, students are required to pro-actively make their own selections and articulate reasons for their decisions. A blogging tool is used as the platform for students to post their reflections. Details of the new assessment design are as displayed in the table below.

Table 1: Assessment descriptions for each of the component tasks – information for students

For this task, you are required to contribute at least **ten** discussion posts on graded forums and write at least **three** blogs based on your reflections on the class discussions.	
5%	Step 1: By the end of week 6 of this course, you need to have: posted at least **five** posts in total on graded forums, **and** contributed at least **one** blog post to the online Participation Blog *Select one post contributed by your fellow students from graded forums, which you think is of a good standard, and explain why*
10%	Step 2: By the end of week 12 of this course, you need to have: posted at least another **five** posts in total on graded forums, **and** contributed **two** blog posts to the online Participation Blog *Select one thread post and one response post contributed by yourself from graded forums, and explain why they are your best contributions*

The purpose of step one is to promote and enhance a collaborative learning environment by encouraging students to review and learn from each other's work. It is also to help the learning community to be engaged in the process and build a consensus on the criteria. During this period, students are required to make online contributions and participate in discussions as well as reflect on and select from their peers' work.

The purpose of step two is to encourage students to apply what they have learnt from the peer review process to conducting an effective self-evaluation. After synthesising fellow students' discussion post together with marks and feedback from the teaching staff in the mid-term, students are expected to gain a better understanding of what constitutes a good online discussion. With this improved understanding, students continue to make online contributions on the forum. By the end of semester, they are expected to make selections from and write evidence-based reflective posts on their own work.

The blogging tool is used to provide a suitable platform for students to post their reflections. It is to separate the assessable reflective posts, from the actual non-assessable discussions. This provides students with more time to concentrate on the quality and relevance of their discussion posts. The public nature of the blog helps students to gain self-confidence when their posts are selected by peers. It helps to minimise plagiarism because students are required to make their self-selected post available to the cohort.

Another benefit brought by the new design is that the marking load for the lecturer is significantly reduced. The lecturer is no longer required to follow all discussions, which may exceed 2,500 posts, in order to ensure the fairness and reliability of the marking. Instead, he needs to read 450 blog posts, which are in fairly similar format. The marking period for blog posts is divided into two - one is due by mid term and another one is due by the end of the term - which also effectively helps to distribute the marking load across the semester and provide additional feedback to the student.

Implementation and findings

The new assessment structure was first trialed in 2011. On the Blackboard course, a special content page was dedicated to the task. The criteria on good discussions were displayed as the first item on the page, posing as learning guides for students. The link to discussion forums was the second item and the third one was the link to the blog with a recommended writing template.

Students reported no confusion on how to complete the task and what needed to be done. The numbers of discussion posts was reduced slightly but the quality of discussions was improved significantly in a more evenly distributed way. Students spontaneously interacted with each other not only on the discussion board but also on the blog.

After the first trial, the lecturer gave very positive feedback in terms of improved quality of online discussions and largely reduced marking load. The number of student complaints about poor quality of discussion posts and delayed return of marks was significantly reduced.

The new assessment design has successfully addressed the desired learning outcomes of General Education courses. It helps to promote students' enthusiasm and curiosity for learning, guides them to be active learners, engages them in the assessment process and develops their abilities to make evidence-based judgments. The design also takes marking efficacy and efficiency into consideration, making the assessment task manageable for teachers.

The design, now, has been trialed in several mainstream courses in the School. More empirical studies will be conducted in order to investigate further on the effectiveness of the assessment design and its impact on students' learning.

Implications

More and more technologies have been introduced into the field of learning and teaching in order to help students to build capacities for the future. Along with benefits and opportunities, challenges and associated issues are also emerging. As a result, educators need to be more aware of pedagogical implications of technologies and take a more holistic approach on task design rather than being restricted by particular technologies. Assessment design is considered as a dynamic process. It is to ensure that the desired learning outcomes will be addressed without compromise whilst maintaining a manageable and sustainable, assessment task.

Beyond the afterglow: Transfer of learning in an online "applications" course - preliminary results of a mixed methods study

John P Egan
Learning Technology Unit
The University of Auckland

This exploratory study examines aspects of student experiences both during an online applications course in the University of British Columbia's Master of Educational Technology (MET) programme, and subsequent to having completed the course in the realm of professional educational practice. Transfer of learning (Caffarella, 2002) related to specific learning activities, a learning community-centered/community of practice course structure, and the overall course design were examined Broadly speaking, transfer of learning was significant for nearly all study participants; specific learning activities designed to foment this did so successfully for most participants. However, the community of practice aspect during the course (Lave and Wenger, 1991), whilst strong, was not as evident after the course ended. This paper represents a preliminary analysis of the findings from the quantitative (questionnaire) portion of a larger, mixed methods study.

Keywords: online, transfer of learning, adult education, learning technologies, mixed methods

In the flush of a recently completed—or soon to be completed—course[1], student evaluation of teaching (SEoT) data can be rather positively skewed: Learning Technologies: Selection, Design and Application (ETEC565A), is, in this regard, not exceptional. But what happens after the warm glow has cooled, and the flush of excitement and novelty have passed? What sort of impact does such a course have on practice?

Unlike many other courses, however, ETEC565A has been designed to give learners a range of competencies transferable to their professional practice as education professionals. In other words, it has transfer of learning—"the effective application by program participants of what they learned as a result of attending an education or training program"—purposefully infused within its design (Caffarella, 2002, p. 204), in terms of learning activities, assessment and interactivity.

With a first cohort having completed ETEC565A over three years ago (in August 2009), we now have a population whose members have had between a few months to several years to try and transfer what they have learned from ETEC565A to their educational practice—beyond the afterglow.

Method

This mixed methods, exploratory study seeks to rigorously examine aspects of student experiences both during ETEC565A and subsequent to having completed the course, in the realm of professional educational practice. The research questions for this study are:

- What are the perspectives of students who have completed ETEC565A with respect to the course and its subsequent value?
- What sort of impact has ETEC565A had on their practice as educators, if any?

The study has two phases. The first is quantitative and consists of a self-administered online questionnaire; the second is qualitative and consists of key informant interviews. Data collection for phase one ended on 15 June 2012: this paper reflects preliminary analyses of phase one questionnaire findings. Interviews for phase two commenced in August 2012. The questionnaire included the following domains of inquiry:

1. Professional experience
2. Programme experience
3. Active learning course component
4. Elearning toolkit wiki course component
5. Formative assessment course component
6. Summatively assessment course component

7. Learning communities and communities of practice
8. Impact on practice
9. Demographic information for classification purposes

The questionnaires were developed based on a review of the current literature, the documentation from the design team for ETEC565A and in collaboration with colleagues knowledgeable about learning technologies, transfer of learning and scholarship of teaching and learning methodology. Five item Likert-scale questions were often used (example: Strongly Disagree - Disagree - Not Sure - Agree – Strongly Agree), which were in some instances collapsed down to three item scales (Disagree - Not Sure - Agree).

Questionnaire invitations were sent via the university's student information service in early May 2012. Reminders were sent mid-May and early June. Out of 269 students who were invited to participate in the study, three had email addresses that bounced back, making an adjusted population of 266. A total of 86 completed the survey, for a response rate of 32 per cent. The survey was delivered via VoVici, a Canadian-based online survey development tool, since local privacy laws preclude using server-based technologies based outside of Canada. Statistical analyses were done using VoVici and SPSS 20 for Mac OS X. University Behavioural Research Ethics Board approval for the study was granted (UBC BREB Number - H12-00986).

Note: many of the alumni of ETEC565A work as public school teachers at the primary, intermediate or secondary level. Others work in different contexts as educational professionals—and not always as teachers (or instructors or facilitators). These include programme managers, instructional designers, and school leaders. Thus the study design (and language) needed to allow for this breadth of professional educational practice to be captured. Hence the use of "educational professionals" rather than "educators" or "teachers".

The participants

Mean and median age for respondents were both 42 years at the time of survey completion. Sixty-two per cent of respondents were female, 30 per cent male (two per cent preferred not to answer; six per cent skipped the question). Fully 74 per cent had completed a bachelor of education programme. Educational attainment levels were skewed towards having completed one or more magistral degrees (seventy-three per cent); in many instances the programme itself). Three per cent had completed a doctorate. Most respondents—68 per cent—worked full-time (35 hours per week or more), viewed themselves as "early adopters" of new technologies (84%) and "learning technologies leaders" (83%); a somewhat smaller number considered themselves "learning technologies innovators" (67%).

Respondents worked in a range of contexts. Forty-three per cent worked in primary or secondary education, with the rest distributed across post-secondary education, adult and community education, and other sectors. Of the 26 per cent who selected "Other", roles included educational technologist, instructional designer, school district administrator or coordinator, project manager, school principal and consultant. Eighty-seven per cent have been an educational professional for five or more years: only one per cent were in the first year of their education career. Just under half (49 per cent) have worked five or more years in their current role. Only six per cent were in theirs for less than one year.

Of their reasons for enrolling in the program, "an interest in learning technologies" was the most commonly cited reason: eight out of ten survey respondents indicated this. Career advancement, being a lifelong learner, and the programme being a wholly online programme were also commonly cited. Conversely, only one in ten cited the absence of any face-to-face graduate programme available near their home community as a reason. Eighty-seven per cent had enrolled in the programme since 2008, with roughly equal numbers starting in September or January (rather than May). At the time of survey completion, 44 per cent had completed the MET programme (most in 2011); another 24 per cent had completed 7 to 9 (out of 10) courses.

About the programme, about the course

UBC's Master of Educational Technology (MET) programme, a wholly online magistral learning technologies programme (http://met.ubc.ca/) has been in operation since 2002, one of the first wholly online degree programmes at the University of British Columbia (http://ubc.ca/), a major, research-intensive, Canadian university. Since 2002 over 250 students have completed the programme, studying on either a full-time or part-time basis. Programme students include those based in Canada, the United States, Mexico, Asia, Europe, the Caribbean, and South Pacific. From its inception, the programme's emphasis has been on informed, critical analysis of the implementation of technology in learning environments. In addition to core courses in research methods, instructional design, educational technology foundations, and learning theory, students choose from a range of elective courses focused around subject matters such as math and science or liberal arts education. Other elective courses focus on the changing notion of texts in the digital age, indigeneity and educational technology, and ventures in learning technology.

As we began to develop ETEC565A, a new, elective “applications” course, one key question informed our work: *what sorts of core competencies would we expect someone who had completed a post-graduate qualification in educational technology to possess*? For ETEC565A the core competencies we identified were:

- A solid understanding of key literatures related to tool selection, learning theory and learning technology deployment best practices
- Familiarity with professional standards related to educational technology
- Ability to create a learning management system (LMS) course site with a customized graphical user interface (GUI)
- Creation of a sophisticated assessment object (quiz or exam), using a range of question types and assessment strategies
- Development and delivery of a pedagogically purposeful digital story
- Use of weblogs and/or wikis for site design, as learning objects, and as an e-portfolio platform
- Mindfulness of issues related to intellectual property, confidentiality, and data ownership
- Design for accessibility
- An ongoing practice of self-reflection

Early in the development process we identified inculcating a learning community, ideally one that formed the basis of an ongoing community of practice (Lave & Wenger, 1991) after course (and programme) completion, as important. While many focus on Lave and Wenger’s notion of “legitimate peripheral participation (p. 29), we believe a larger message is sometimes lost: peripheral participation is merely one phase or period of community membership for skilled practitioners: to move beyond the rudiments of nascent practice requires a shift towards the centre (rather than remaining on the periphery) of a community of practice. In fact, Lave and Wenger specifically warn:

> In summary, rather than learning by replicating the performances of others or by acquiring knowledge transmitted in instruction, we suggest that learning occurs through centripetal participation in the learning curriculum of the ambient community. Because the place of knowledge is within a community of practice, questions of learning must be addressed within the development cycles of that community, a recommendation which creates a diagnostic tool for distinguishing among communities of practice. (p. 100)

In instructional design terms, community of practice represents a goal, aim, or principle. Our learning community course design seeks to provide learning activities that foment, support, and leverage community and its concomitant interactions. Endeavouring to garner a richer understand these centripetal, ambient, cyclical aspects of community of practice dynamics are therefore also a focus of this study—the qualitative component, specifically.

Across the MET programme’s student community there is a wealth of knowledges and skills: collegial support and advice are positioned firmly at the centre of most aspects of the MET. ETEC565A has been designed in a way that purposefully leverages this, making collaborative learning—formal and informal—as integral to success in the course.

Literature review

Caffarella notes that transfer of learning has “often been thought of in behavioural terms—that is, what is to be transferred can be clearly specified in terms of observable changes in knowledge, skills and attitudes.” (2002, p. 205). Brookfield (2005) describes transfer of learning as “the process by which learners apply, in settings outside of an...educational setting, the skills and knowledge they have learned within that setting” (p. 627). Sork identified “devising transfer of learning plans” as important in the program planning (or curriculum) process, and credits Caffarella with bringing the concept of transfer of learning to the fore, since “most (curriculum) models are silent on this important aspect of planning, or just assume that this will be taken care of when designing instruction” (2011, p. 162). Among numerous transfer of learning techniques identified by Caffarella (p. 217), individualized learning plans, mentoring, portfolios, networking, and reflective practice all feature prominently in the course design for ETEC565A.

Transfer of learning and specific course components

Throughout ETEC565A a series of learning activities are facilitated via the course WebCT Vista discussion forums. These inquiry-, case-, and problem-based learning scenarios were designed to allow students to link the relevant readings to practice, reflect upon their own experiences, and to communicate as an educational professional with their peers. With a disparate range of educational practices, we created scenarios that reflect, in broad terms, the range of contexts in which MET students work. Similarly, the trigger question for each has the scenario protagonist inquiry of the reader (as an educational professional) for their opinion on an idea or strategy in the protagonist's practice. This allows for each student to draw upon their own form of educational expertise in their response.

This strategy was impactful: Sixty four per cent of respondents agreed that the scenarios improved their practice. An even higher percentage—81 per cent—agreed that the scenarios helped them link theory to practice.

The course's Elearning Toolkit (http://wiki.ubc.ca/Course:ETEC565/Elearning_Toolkit) is a wiki-based, self-directed repository of various elearning design elements. Students are encouraged to choose which elements upon which to focus their time, based on their extant skill level and design decisions for their course assignments. We made the toolkit forward facing on the web, in the hope that students would find the resource useful subsequent to having completed the course. We also wanted to model ways in which free social media can be leveraged to facilitate learning—sometimes in ways other than the tool's more obvious affordances.

Seventy-one per cent have indeed used the toolkit wiki since completing the course. Post-course, 38 per cent have found the toolkit useful: thirty-six per cent said it had impacted their practice. Twenty-six per cent had developed a similar resource in their own context. Thus significant transfer of learning related to toolkit—its contents and its pedagogical approach—occurred.

Learning community; community of practice

Nearly all respondent found the learning community design employed in ETEC565A relevant, with two-thirds finding it very or highly relevant. Table One outlines these results:

Table 1: Relevance of learning community aspect of course

Learning community aspect was:	Percent
Highly relevant	43
Very relevant	24
Significantly relevant	25
Marginally or not relevant	8
Prefer not to answer	1

In total, 92 per cent of the study participants saw the learning community aspect significantly, very or highly relevant.

Our aspiration for the MET is that the learning community persists post-programme as a community of practice; this is also a goal for ETEC565A in particular. In fact, almost half of respondents—forty-seven per cent—felt there was a programme-level community of practice. However, only 36 per cent felt ETEC565A's community of practice persisted after the course. A better understanding of why this is the case, including how participants differentiate between a course-level versus programme-level community of practice, are a key topic for the ongoing qualitative interviews.

ETEC565A overall

Writ large, nearly all respondents (over 90 per cent) felt somewhat or very successful in applying what they learned in ETEC565A to their practice. Fifty-eight per cent felt highly successful; thirty-five per cent felt somewhat successful; only four per cent unsuccessful. Of those who felt somewhat or unsuccessful, a range of (non-mutually exclusive) reasons were identified, as outlined in Table Two.

Table 2: Reasons not highly successful

Reasons	Percent
Onerous assessment and prep time	19
Lack of support from my leadership	13
Lack of support at the district level	12
Lack of access to hardware	11
Lack of access to software	9
My priorities have changed	1

Of the reasons selected the sole intrinsic one—the last one, “my priorities have changed”—was selected by only one per cent of respondents. All the others are structural barriers, with workload and various lacks of support the more frequently cited reason.

Participants overall ranked ETEC565A as having great value (72 per cent), with 35 per cent describing it as the most valuable MET course they have taken; another 37 per cent describing it as highly valuable (only six per cent characterized it as having limited or no value). In terms of impact on their practice, nearly half—47 per cent—saw its impact as very significant, with another third seeing it as having had significant impact. Again, only six per cent characterized it as having limited or no impact.

When asked a final qualitative question to address anything not covered in the questionnaire, several respondents spoke to ETEC565A’s transfer of learning. Note: each paragraph represents a different person’s response to the question:

> I felt the most inspired by ETEC565A to advance my tech expertise. I was keen to initiate a community of practice in my chemistry classes immediately. I learned to use tools I had no idea I was capable of creating.
>
> Incredibly practical course. The constructivist nature was frustrating at times, but very valuable. This course has had the biggest daily impact on my teaching career because I use what I learned - the digital story, a blog, and an asynchronous discussion forum in a Moodle shell. Without this course, I would not have had experience with any of these tools and it would have taken me much longer to find the time on my own to learn them, let alone implement them.
>
> The community of practice in this course should be an example for all MET courses. If so, the community of practice will be strong all the way along the programme and will probably continue after in some ways. The collaboration with others in that course is something I will remember... I am still in touch with some of the people I met in that course. That aspect alone means a lot to me. Within other things, the teacher had facilitated that aspect all along the course which I applaud. As an online teacher myself I know exactly how much energy it takes from the facilitator. BRAVO!!!
>
> Thank you for teaching me how to learn.

Clearly there has been significant transfer of learning for these respondents, in terms of skills, but also with respect to ETEC565A’s impact on their practices as educational professionals, as well as their membership in a community of practice.

Conclusion

Sixty per cent of survey respondents were initially willing to participate in a follow-up interview; these will be conducted between July and November 2012. The interview questions have been crafted to clarify ambiguous results from the questionnaires, gather stories related to students’ course and post-course experiences, and to solicit additional feedback related to transfer of learning and the community of practice experience, specifically with ETEC565A and with the MET programme overall.

In addition to the descriptive data included here, additional quantitative analyses will be conducted. In particular we are keen to discern any effects related to gender, years in practice, context of practice (in terms of student audience, teacher versus other educational professional, and jurisdiction), and age on the transfer of learning. We will also analyze the data for any effects related to the gap between completing ETEC565A and completing the questionnaire: do those who completed the course 2 months ago (for example) differ in perspective between those who completed it two or three years ago?

According to Caffarella transfer of learning is, on a fundamental level, about assisting people to make changes, “in themselves, other people, practices, organization and/or society (p. 206).” A richer understanding the extent to which transfer of learning occurs, what facilitates transfer, and what impedes it, serves this aim. Lave and Wenger argue that “development of identity is central to the careers of newcomers in communities of practice, and thus fundamental to the concept of legitimate peripheral participation.” (p. 115) the extent to which participants’’ experiences align with this position—the extent to which their identities as educational professionals have been impacted by completing ETEC565A and endeavouring to transfer the knowledges acquired there to their educational practice—is also something we will explore during the interviews.

Google Analytics as a tool in the development of e-learning artefacts: A case study

Damon Ellis
Massey University

The design, development, and evaluation of e-learning artefacts requires extensive and potentially time-consuming evidence collection in order to verify that the artefact is fulfilling its educational goals. There is a need for inexpensive tools that can facilitate the quantitative portion of this evidence base. This paper explores the use of Google Analytics in this capacity. The needs analysis, design, testing, embedding, and evaluation of APA Interactive – an e-learning artefact targeting students at Massey University – serves as a case study, demonstrating how analytics data can inform all stages in the creation of web-based educational resources.

Keywords: online learning; evidence-based practice; e-learning artefacts

Google Analytics launched in 2005, and rapidly became one of the most prominent on-site web analytics solutions (Clifton, 2012). Analytics can provide website owners with a wealth of data, measuring visitor numbers, the source of those visits, visitor technology, the way in which visitors interact with the site, and more. The data is aggregated in real-time but is not uniquely associated with individuals. Although Google Analytics primarily targets e-commerce sites, it has been drafted by educational technology research as a way to analyse the use and success of educational websites and online tools. Recent studies have employed analytics to improve website navigation (Fang, 2007), identify user needs through search keyword analysis (Yardy & Date-Huxtable, 2011), and track multimedia usage (Betty, 2009).

This paper discusses the ways in which Google Analytics informed development of an educational web tool, APA Interactive, at Massey University. Phillips, Kennedy, and McNaught (2012) describe stages in the lifecycle of an e-learning artefact; in this case study analytics data was a component in five of these stages:

- the original needs analysis
- the design and testing of the APA tool
- embedding in authentic learning environments
- evaluation of its reception and use
- identification of opportunities for future development

The purely quantitative data of analytics is not sufficient on its own to inform these stages, but "usage statistics have some advantages over other site evaluation tools because they monitor how users actually work with a site rather than what they say they would do" (Arendt & Wagner, 2010, p. 38). Analytics provides detailed, granular, and anonymous data that can be compared over years of use, making it a prime candidate to support the evidence base behind e-learning artefacts.

Context

The APA Interactive tool was developed for Massey University's Online Writing and Learning Link (http://owll.massey.ac.nz/). OWLL is a public-facing learning portal covering a wide range of tertiary study topics: time management, critical thinking, assignment writing, referencing, exam preparation, and other aspects of academic literacy. The university's Centre for Teaching and Learning operates and maintains the site.

OWLL is not designed to be a learning environment in itself; a relatively static website has the potential to fall into the "education as information delivery" trap (Herrington, Reeves, & Oliver, 2005) and ignore the authentic environments necessary for effective teaching. Instead, the website is conceptualised as a source that can be used within classes and mediated by the lecturer, or accessed independently by students from throughout the university.

Needs analysis

Analytics data has been collected for OWLL since 2007. The original identification of the gap that APA Interactive was designed to fill relied on three statistics available through Google Analytics: pageviews by section, keywords used in Google searches that led to the site, and keywords used in the in-site search bar.

Pageviews are perhaps the most widely used feature of Google Analytics. They track the number of times a page has been accessed by a web browser – a more useful statistic than server-side data because they exclude the majority of non-browser visits by web crawlers and robots (Clifton, 2012). These pageviews can be categorised by subsection within Google Analytics. Table 1 summarises the most popular sections of OWLL from 2009 to 2011. Referencing was consistently the most popular section by a significant margin.

Table 1: 2009 OWLL pageviews sorted by section

OWLL section	Percentage of pageviews		
	2009	**2010**	**2011**
Referencing	29.6%	37.2%	40.9%
Assignment types	18.6%	15.2%	16.1%
Academic writing	9.1%	11.8%	12.5%
Study skills	7.9%	6.5%	5.8%
Tests and exams	5.7%	4.6%	3.9%
All other sections	29.2%	24.7%	20.9%

Analytics data also divides visits based on the method of entry: direct (visitors typing the address into their browser or following a bookmark), referral (link from other websites), and search (visitors coming from Google, Bing, or another search engine). In the case of visits arising from a search engine, analytics lists the keywords or phrases that led to the site, and this can provide additional data about the topics that are most important to the site's users. In the case of OWLL, 26.4% of the 2009 searches involved keywords relating to referencing: "citation," "APA," "MLA," "footnotes," "referencing," and the like. Likewise, searches from the site's own search bar focused on referencing (11.5% of searches in 2009).

The popularity of the referencing section was reinforced through other channels, such as informal student and staff feedback. That feedback also identified the core problem: referencing involves simple rules, but there are hundreds of those rules. The student need was caught between "information overload" and "I need an answer to my specific (and obscure) question." Few students would need to know how to cite a book with six authors until they encounter that specific situation, but once they do encounter it they require an answer immediately.

Teaching the technical aspects of referencing is not a new problem, and many solutions already exist. The two most common approaches are books and websites with long lists of examples and explanations, and bibliographic management software such as EndNote, Mendeley, or Zotero. The APA Interactive solution targeted the middle ground between these two solutions, incorporating the easy access and low learning curve of a website while avoiding the excessive and static inventory of referencing rules.

Design and testing

Studies in website viewing behaviour consistently emphasize that users prioritise the parts of the webpage immediately visible when the page is loaded – the so-called 'above the fold' principle (Djamasbi, Siegel & Tullis, 2011). However, it can be difficult to determine just what appears above the fold given that users have wildly different screen resolutions.

Google Analytics records the screen resolution of all visitors to the site. In 2009, more than 50% of users had a resolution of 1024x768 or 1280x800, and this data formed the basis of the APA Interactive tool's design. Since that time Google has added a visual breakdown of which sections of a webpage are visible to its users without scrolling (Yahas, 2012).

There are many answers to the 'above the fold' problem: clickable anchors that direct users to the appropriate part of the webpage, hide-reveal script that expands sections of the page, and formatting solutions such as charts and flowcharts. APA Interactive was conceived as a tool that would maximise the amount of information that could be conveyed in a small space, while also preventing information overload by revealing relevant sections only when explicitly required. The final version incorporates more than 6000 words of text, but the entire artefact remains above the fold for most users (Figure 1).

APA Interactive presents a range of basic referencing options (referencing a book, book chapter, journal article, and so forth) and a menu of customisable options (multiple authors, edition numbers, print vs. internet sources). When these are selected, the tool creates a correctly formatted sample of the reference list entry and in-text citation for each option. Several hundred different combinations are possible depending on the options chosen. Clicking on parts of the example opens popups that give further details about that component: where to find the publisher location, for example, or how to capitalise the source's title.

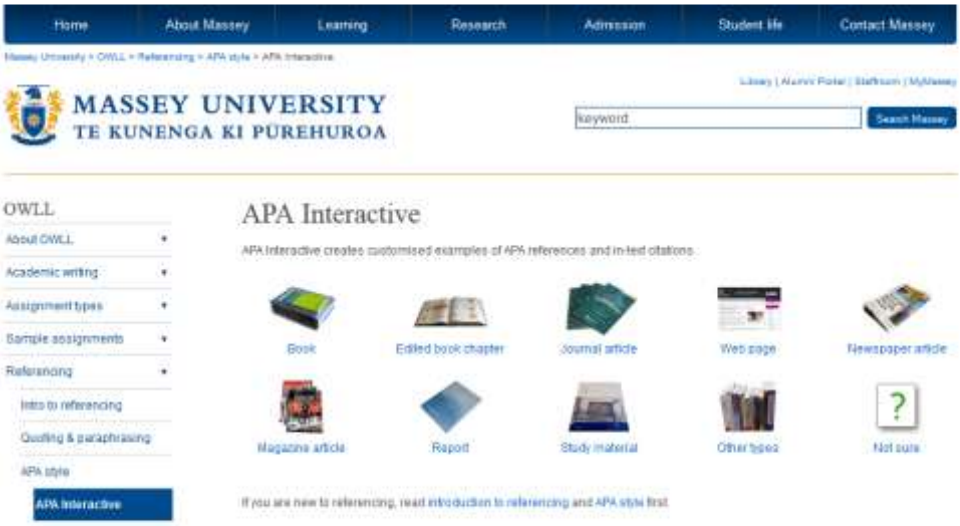

Figure 1: APA Interactive

The tool was coded in JavaScript with the help of the jQuery library. Google Analytics data directed the technical aspects of pre-release testing. If more than 1% of OWLL visitors used a particular browser or system, that environment was tested to ensure that APA Interactive displayed and operated correctly. In 2009, four browsers were above that 1% threshold: Internet Explorer (65.3%), FireFox (25.0%), Safari (5.6%) and Google Chrome (2.8%). The system breakdown at that time was 91.2% Windows, 8.0% Mac, and 0.6% Linux, so the tool was tested on both Windows and Mac systems. The technical specifications of the target audience were clearly identified in the analytics data. Any future changes in those specifications can also be tracked: in 2012 Google Chrome is used by 28.0% of visitors.

Embedding in learning environments

As mentioned earlier, Google Analytics tracks the source of all visits. This proved helpful to identify the learning environments in which OWLL was used. In 2009, the majority of referral links (37.9%) came from within Massey University's Online Learning Enviornment (OLE), WebCT. The development of APA Interactive coincided with the university's shift to Moodle, so connections to the tool were integrated into the new OLE via custom blocks that lecturers could add to their Moodle environment. Teaching development staff also encouraged lecturers to use the tool in assignment instructions and study materials. A significant minority of referral visits (5.9%) came from links on the Massey Library website, so this site was also identified as a potential student entry point.

Evaluation

Quantitative data is only a part of the proper evaluation of an e-learning artefact: "usage logs simply record users' behaviour in an e-learning environment, but they do not explain why that behaviour occurs" (Phillips et al., 2011, p. 997). The quantitative measures of Google Analytics used to evaluate the success of the tool included pageviews, numbers of returning visitors, and average time spent on the page. By all of those measures, APA Interactive has seen significant uptake by students and staff.

Over the first semester of 2012 the page recorded 100,713 views, an average of more than a thousand views per day. Although analytics data on returning vs. new visitors is not a perfect metric (Clifton, 2012), Google Analytics data suggests that only 27% of the pageviews were from first-time users, indicating a high level of repeat usage. In terms of time spent on the page, APA Interactive recorded more than twice the overall site average, suggesting that students are accessing the details provided by the tool.

Future development

Loftus (2012) notes that analytics reports can facilitate iterative improvement. Data can be used to identify and quantify trends in user technology and behaviour, and that in turn can inform future developments. For example, the current movement towards mobile learning and social network integration (Brown & Green, 2012) is reinforced by the data. Google Analytics can identify the ratio of visits from mobile devices. While still small as a proportion of total visits, mobile users in the first semester of 2012 increased nearly sevenfold over 2011. In terms of social network integration, links on Facebook are now the most common non-Massey source of referral visitors.

Conclusion

Analytics provides data beyond a simple headcount of visitors to a page. The method of entry (search keywords and external links), the technical specifications of users (screen size, browser, operating system, and mobile use), and the details of visits (levels of return visits, time spent on the page) can all inform the design, evaluation, and continued development of an e-learning artefact. This data can complement and verify other sources of information, such as student and staff feedback, to ensure that these artefacts are fulfilling their function and will continue to do so in the future.

An Informal Community of Practice: The Case of the DEHub Virtual Worlds Working Group

Helen Farley

University of Southern Queensland

The DEHub Virtual Worlds Working Group has an informal membership of nearly 200 members with an interest in education and virtual worlds within the Australian and New Zealand context. Members come from a variety of academic disciplines and may be teaching or research academics, Research Higher Degree candidates, project managers, virtual world builders and developers. The group acts as an informal Community of Practice, facilitating learning and the transfer of skills through social contact, opportunities to collaborate on projects and publications, and through the sharing of knowledge and experience. This poster provides a snapshot of the activity of this highly active group.

Keywords: community of practice, social learning, informal learning

An informal community of practice

The Australian and New Zealand Virtual Worlds Working Group (VWWG) began in November 2009 as a small group of 10 academics from the DEHub Consortium of the University of New England, Charles Sturt University, University of Southern Queensland and University of Central Queensland. At that first meeting, it was decided to open up membership beyond the DEHub consortium as there was considerable expertise in virtual worlds and education outside of that group of institutions. The group now has a membership of 190 from 55 Australian and New Zealand institutions. From February 2010, the group has met monthly in Second Life at Australis 4 Learning – an island jointly owned by the University of New England, the lead project member of the DEHub, and two other members of the VWWG (Gregory, 2011). The membership of the VWWG has a common interest in using virtual worlds for teaching and learning, though individual's own roles in institutions vary. The majority of the members have roles as teaching academics but there are also research academics, Research Higher Degree students, and virtual world builders and developers. Even within those groupings, there is considerable variation both in the level of experience in dealing with virtual worlds and the teaching disciplines.

Since its inception, the VWWG has acted as an informal Community of Practice. Étienne Wenger defined a community of practice as “a group of people who share an interest in a domain of human endeavour and engage in a process of collective learning that creates bonds between them” (Wenger, 2001, p. 1). Wenger’s theory acknowledges that adults learn through everyday social practices rather than in environments intentionally designed to support learning. Communities of practice differ from other communities in three significant ways:

1. They generally focus on a domain of shared interest;
2. Members interact and learn together by participating in joint activities and discussions, helping each other, and sharing information; and,
3. Members develop a shared collection of experiences, stories, best practices and solutions to problems. Communities of Practice exist only as long as participation has value to their members (Gray, 2004, pp. 22-23).

Methodology and Results

This interpretive study used a multi-method approach based on practices and assumptions of qualitative inquiry. Data sources included a review of newsgroup postings, publications and project reports of participants, Second Life chat transcripts, and a survey consisting of six open-ended questions (Patton, 1990). The study was limited to the experiences of those six members who were selected as being representative of the group (Gray, 2004, p. 24). This pilot is preliminary to a larger study to be undertaken in the latter part of 2012 and beginning of 2013.

The findings in this study suggest that the VWWG does function as a Community of Practice. Motivations to participate included an opportunity to learn new skills and work practices, the opportunity to collaborate, and a means of social and professional connection to colleagues. The response below is typical of those received:

> Belonging to a group of like-minded academics, educators and HDR students has been very intellectually sustaining. Within my own immediate environment there are very few opportunities to discuss things virtual with others who are interested, active in the field, and who actually know something about virtual worlds and education. Through the VWWG I have become much more aware of the work others are doing around Australia and in New Zealand which has made me feel less isolated in my own work. It has also exposed me to collaborative opportunities that I otherwise would not have had.

The findings also suggests that the moderator played an integral role in enhancing the functioning of the community by providing technical support, maintaining group process, nurturing the social aspects of the community, and facilitating learning. As one of the members indicated, the moderator “has been the driving force that kept the momentum going. Without this community leader, I don't think the group would have survived. Sue [the moderator] deserves our gratitude for this effort.”

Members of the VWWG began collaborating with each other on a number of projects and publications soon after the group’s inception. The first was collaboration between the University of New England and Charles Sturt University with a scoping study undertaking a systematic review and environmental analysis of the use of 3D immersive virtual worlds in Australian Universities (Dalgarno, Lee, Carlson, Gregory, & Tynan, 2010, 2011). In November 2010, five institutions from the VWWG were awarded an ALTC (Australian Learning and Teaching Council) grant called VirtualPREX researching virtual worlds for professional experience by pre-service teachers through self, peer and academic assessment, both formative and summative (Gregory, 2011). In 2010, 2011 and 2012 members of the VWWG wrote joint papers for the annual ascilite conference where nearly all members contributed. Members of the VWWG also participate in presenting at other’s institutions, joint presentations at symposiums and papers at conferences. They have also joined together to conduct conferences, workshops and sharing of space in the virtual world (Gregory, 2011). The most recent collaborative project that the group has undertaken is the production of a VWWG book. Extended abstracts were sought from authors worldwide to contribute to the book titled “Virtual Worlds in Online and Distance Education” which will be published in late 2012. This call for papers received 94 contributions, demonstrating the interest and wide expertise of the group. All members who responded to the survey indicated that this collaborative aspect of membership was well-appreciated.

Conclusion

The Australian and New Zealand Virtual Worlds Working Group acts as a Community of Practice for those interested in education in virtual worlds. It has demonstrated how international collaboration can take place. The group currently meets inworld (in Second Life) once per month to discuss current and future collaboration and how to assist each other in achieving their individual, institutional and project goals.

Bridging the digital divide: bringing e-literacy skills to incarcerated students

Helen Farley
Australian Digital Futures Institute
University of Southern Queensland

Angela Murphy
Australian Digital Futures Institute
University of Southern Queensland

Tasman Bedford
Open Access College
University of Southern Queensland

Incarcerated students face a number of additional challenges to those faced by most other students studying at a distance. Lack of internet access is especially problematic for those studying in a sector that is increasingly characterised by online course offerings. This paper reports on a trial project that will attempt to address the digital challenges that hinder access to higher education by incarcerated students, and to provide them with inclusive learning experiences. The trial utilises Stand-Alone Moodle (SAM) and eBook readers with a small sample of incarcerated students participating in the Tertiary Preparation Program (TPP) at the University of Southern Queensland (USQ). This project potentially addresses the digital divide experienced by incarcerated students as compared to the general student population. It is anticipated that students will participate in learning experiences more closely related to those experienced by students who study in online environments, that and they will acquire relevant e-literacy and e-research skills.

Keywords: digital inclusion; distance learning; higher education; prisons; Moodle; eReaders

Introduction

Australia's prison population averaged 29,106 adult prisoners in 2011 (ABS, 2011). Most prisoners are from low socio-economic status (SES) backgrounds and are likely to have experienced social and economic disadvantage. As a result, in comparison with the general Australian population they experience a relatively high chance of unemployment on release, face on-going health and social problems and have limited work experience (Giles, Le, Allan, Lees, Larsen & Bennett, 2004). Contemporary studies demonstrate that the rates of recidivism are significantly lower for prisoners undertaking a post-secondary educational program while incarcerated, compared to the general prison population (Richards et al., 2008; Aceves et al., 2011). Distance education (DE) has traditionally been viewed as a boon to education in prisons, delivering education to students that are unable to undertake traditional face-to-face education (Salane, 2008). However, the increasing reliance on e-learning has resulted in greater challenges for incarcerated students attempting to participate in higher education (HE). Almost universally, prisoners are not permitted any access to the internet, and ICTs often pose an unacceptable security risk.

PLEIADES (Portable Learning Environments for Incarcerated Distance Education Students) is a trial project undertaken by USQ to address some of the barriers to participation in HE by incarcerated students. The aim is to trial the use of e-learning technologies which are independent of the internet, yet still enable students to access USQ courses electronically. The learning technologies to be piloted include an internet-independent version of USQ's Learning Management System (LMS) specifically developed for the project called Stand-Alone Moodle or SAM. SAM will replicate USQ's online learning environment for incarcerated students by enabling them to view and use the same course materials and assessments embedded in the USQ LMS but in a simulated online environment without internet access. The use of SAM in PLEIADES will also be supported by the use of eBook readers. The eBook readers will enable incarcerated students to access course and reference materials in order to extend learning beyond their very limited access to the correctional centre computer lab and into personal and leisure time. In this way, a learning experience comparable to the experience of non-incarcerated students studying the same program at USQ will be provided for incarcerated students. The project will be deployed in Semester 2 2012 with a maximum cohort of 15 incarcerated students enrolled in *TPP7120 Studying to Succeed* as part of the Tertiary Preparation Program at the Southern Queensland Correctional Centre (SQCC).

Current provision of tertiary education in prisons

The role of education in prisons serves two purposes: increasing opportunities for employment after release, but also most importantly, improving self-esteem and self-confidence to assist in avoiding the negative lifestyle temptations that contributed to the initial incarceration of offenders. As a result, a greater emphasis has been placed on education opportunities for prisoners. Studies have found that participation in formal education programs have generally been successful in reducing recidivism (Callan & Gardner, 2007). Even so, participation remains low with 35% of eligible prisoners in 2009-10 participating in accredited education courses. The decision to participate in education depends on a number of factors including the length of sentence, the constraints of sentence management plans, the capacity of Education Officers to provide learning support, the demands of in-prison employment the availability of programs and courses (Giles et al., 2004). Overcrowding and restricted access to computers further limits prisoner access to education (BearingPoint Review, 2003). Prisoners are hampered in their choices by the extent to which courses require students to access online activities. Correctional centres are reliant on tertiary education institutions for the provision of DE for offenders who wish to participate in HE (Dorman & Bull, 2003). Preparatory, undergraduate and some postgraduate programs have traditionally been accessible to prisoners in print-based forms. These materials are sometimes supplemented by visits from teaching staff, depending on the location of the provider. Provision of education services to prisoners is becoming increasingly problematic given the increasing reliance on digital and mobile delivery of materials and assessment.

Information Technology and Lack of Internet Access as Barriers to Prison Education

The 'USQ Connected' initiative is representative of the broader sector's increased reliance on online delivery. Though the increased use of technology does help address the emerging demand for flexibility in learning, it also excludes significant portions of the student population including incarcerated students (Aceves et al., 2011). Currently, supporting incarcerated students to successfully undertake university studies requires Education Officers at correctional centres to spend time liaising with universities, carrying out the online research that students need to fulfill the demands of the course, and printing out that information for the students. A major challenge for future DE provision to this cohort is to identify alternatives that will allow prisoners to access the LMS while maintaining the necessary security. Although the traditional forms of delivery using hard-copy are successful to a certain extent, they do not enable incarcerated students to develop the e-literacy skills that are essential in current education environments. Most prison education centres provide access to computers which inmates may access for a few hours under strict supervision. Some prisons run in-cell laptop programs for students engaged in tertiary studies (BearingPoint Review, 2003). Incarcerated students are unable to access course materials and multimedia supplied via the course LMS (at USQ an instance of Moodle called the 'Study Desk') and they are unable to complete assessment requirements of courses online. Most significantly, they are unable to communicate with other students outside of the facility and even within the facility through course discussion boards. This undermines the social constructive pedagogy favoured in many post-secondary programs (Erisman & Contardo, 2005; Bowden, 2002) and poorly prepares students for a world in which employers expect their employees to be familiar with social networking and other web 2.0 resources. The imperative to address this digital divide for these students is acute.

Addressing digital inequities using secure learning technologies

The PLEIADES project resulted from discussions between staff at the SQCC, Queensland Corrective Services (QCS), the Australian Digital Futures Institute (ADFI) and the Open Access College (OAC) the latter two organizational units being located within USQ. OAC has sought to support students in disadvantaged or vulnerable groups through the provision of a Tertiary Preparatory Program (TPP) articulating into various degree pathways. TPP is offered by the OAC to prospective students over the age of 18 who cannot gain entry via traditional pathways. Typically, these students are from low SES backgrounds and may have experienced educational disadvantage (Klinger & Wache, 2009). If the TPP is to prepare students for university studies that incorporate the use of the online Study Desk, then developing e-literacy skills have to be an integral part of the course (Orth & Robinson, 2010). A significant number of incarcerated students enroll in the TPP and, for this cohort in particular, the educational aims of the program can be difficult to achieve. The course which is the focus of the PLEIADES project is *TPP7120 Studying to Succeed*. Because of their lack of internet access, incarcerated students have received large blocks of printed matter containing course materials and resources. This is costly for USQ to assemble, print and post, and is in no way interactive.

Stand Alone Moodle

The PLEIADES project team determined that in order to provide an equivalent study experience for incarcerated students as compared to non-incarcerated students enrolled in *Studying to Succeed*, it would be necessary to replicate the course Study Desk. This alternate instance of the LMS could have no possible communication to the internet. It would have to be wholly contained on the correctional centre education server with installation and harvesting of results being conducted using flash drives by USQ's Division of ICT or SQCC education personnel. USQ has been working closely with Queensland Corrective Services to define the functionality of the SAM Study Desk that would comply with ICT and security constraints. This modified LMS will be installed on the educational server at SQCC and will be accessed via the network of computers available to students in a designated education lab located at the correctional centre. Incarcerated students will be able to access course materials as well as to complete quizzes and participate in discussion boards via the SAM LMS. The discussion boards will only be accessible to the incarcerated students while located in the correctional centre's education computer lab and under the direct supervision of Education Officers. It is expected that Education Officers will 'strip' the course assessment items prepared by students from SAM and submit them directly into the USQ online assignment submission system. Education Officers will have administrative rights to this system to streamline the process. In this way, incarcerated students will be able to gain many of the e-literacy skills they will need in a simulated online environment without having or needing access to the internet, thus completely avoiding those security risks engendered by prisoner access to the internet.

eReaders

Students within correctional centres are often juggling part-time study with work commitments. An incarcerated student undertaking a part-time study program may only have access to the relevant computer lab one afternoon a week. There is an in-cell laptop computer borrowing scheme that some incarcerated students are able to access. Even so, the opportunities to extend learning beyond the education lab are limited and laptops are not available to students enrolled in the TPP program (these are reserved for students enrolled in degree programs). In response to this need, the PLEIADES project team will pilot an eBook reader scheme to run in conjunction with the SAM trial. eBook readers are small portable electronic devices which can hold a large number of electronic files such as electronic books (eBooks). The eBook readers in the trial will be loaded with course study materials and additional study resources of potential use to the students. The eBook readers selected for use in the trial are Sony PRS-505s, chosen because they do not have any ability to connect to the internet either via wireless or 3G networks. In addition they cannot connect remotely to another device other than through a specific cable which will be retained by the education officers. They have a long battery life that can be measured in weeks or months. The eBook reader batteries are an integral part of the device and cannot be removed or modified without damaging it. For the pilot project, course materials and associated reference material will be vetted for copyright compliance and converted into ePub format for loading onto the Sony eBook readers to be provided to incarcerated students enrolled in the *TPP7120 Studying to Succeed* course. An eBook reader borrowing scheme will be set up by Education Officers at the SQCC, similar to the one that already operates to manage the borrowing of in-cell laptops. The eBook readers are charged using a cord that plugs into a USB port of a computer; in this case, an Education Officer's computer. Students using the devices will be able to hand their eBook readers to Education Officers on specified days for charging. They will be able to take the eBook readers back to their cells to browse readings, watch embedded multimedia, take notes on readings and thereby extend their study into their private time.

Evaluation

The pilot project will be evaluated using a design-based evaluation methodology to determine whether these learning technologies are able to improve access, retention and completion rates of incarcerated students as well as give them an experience comparable to that of distance students who are not incarcerated. The project will be deployed in July 2012 at the Southern Queensland Correctional Centre. An evaluation of the trial project will be carried out, involving the correctional centre education staff, the incarcerated students involved in the project, the course lecturers, and correctional staff responsible for IT security. Much of the research that has been conducted in correctional centres has failed to reflect the views of prisoners themselves (Richards et al., 2008). Consequently, ethical clearance has been obtained from USQ and the Queensland Department of Corrective Services so that quantitative and qualitative data can be collected from Education Officers, course lecturers and most importantly, from the students themselves.

Conclusion

USQ delivers programs to a large cohort of students from regional, remote or rural areas within Australia as well as internationally, in addition to incarcerated students. These students are frequently from low socio-economic backgrounds and they often experience difficulties in gaining access to the internet or using mobile devices. USQ and other distance education providers, therefore, need to address the issue of lack of internet access if they are to continue to remain viable providers of HE within these environments. At present there are very few other prisons in Australia or globally that have successfully implemented electronic or mobile learning for incarcerated students. USQ expends large sums of money and resources on printing materials for students and providing individual alternatives to students who are unable to access online resources. USQ personnel are independently developing alternative approaches on a case by case basis without support from USQ policy or processes. The development of secure learning technologies such as SAM and eBook readers for prison education will result in improved quality and consistency of educational initiatives, encourage student-centred learning and provide learning opportunities that can be tailored to a student cohort that has greater educational needs than most members of the general community. Results from the project outcomes will inform USQ, the Queensland Department of Corrective Services, and other stakeholders on innovative technological approaches to enhancing the digital inclusion of learners who cannot access the internet, and of the needs of students in areas where internet access is not possible such as in corrective facilities, remote Australian Indigenous communities, and other rural and remote communities.

Rejuvenation Island: Enriching the Learning Journey through Immersion in Virtual Restorative Environments

Helen Farley

University of Southern Queensland

Immersive natural environments provide a means of restoration for adults and may present benefits for pre-service teachers who are unfamiliar with the natural world. The use of restorative virtual environments could be extended to schools in urban areas in particular, allowing pupils and their teachers to undertake field trips, and to relax in a calming and restorative context. This paper reports on a project that investigates the potential restorative benefits of immersion in simulated natural environments in virtual worlds. A cohort of pre-service teachers were taken into the simulated environment and reported that the island produced strong positive feelings in respondents, akin to being in a natural environment. However, it was also clear that a lack of familiarity with virtual environments diminishes the beneficial impacts of this immersion.

Keywords: restorative environments, virtual worlds, teacher education, biophilia, effects of nature, restorative therapy, stress management, Second Life

Benefits of Immersion in Natural and Natural-seeming Virtual Environments

This study seeks to evaluate the restorative impact of pre-service teachers' online engagement in a simulated natural virtual world environment. Measures of subjective wellbeing and attention focus were taken before and after the immersion experience with groups taking a survey online. The findings are in accord with emerging research in this field, and consistent with studies by Valtchanov, Barton and Ellard (2010), and Depledge, Stone and Bird (2011), which indicate that immersion in virtual environments has restorative qualities.

Context of the Study

These findings have broader implications in the context where education for creativity and sustainability is noted as a priority (MCEETYA, 2008) for human and environmental health in 21st century Australia. A growing body of international research indicates that engagement in natural environments has positive benefits for children's physical and emotional development (Jones, 2006; Kirkby, 1989) and psychological wellbeing (White, 2004; Wilson, 2008), and the restorative benefits of natural environments upon adult attention span, perceptions of creativity and wellbeing have been reported by Jones and Moodie (2012; 2012) in pilot projects for this study, and by Depledge, Stone and Bird (2011) who documented enhanced recovery of "attentional capacity and cognitive function following intense mental activity" (p. 4660) as a result of immersion in virtual environments.

Conduct of the Study

Participants: 56 participants in total undertook the study. The majority of participants were undergraduate pre-service teachers. A small number (n=3) were postgraduate students undertaking Masters level study in education. Group 1 (n=9) undertook the survey and immersion experience in an on-campus computer studio. Group 2 (n=47) undertook the same experience online and at a distance from the campus. The survey tool: A SurveyMonkey quiz included 8 questions for which participants selected answers on a 5 point Likert scale. After question 1 and 2 participants spent 30 minutes on Rejuvenation Island in Second Life. On their return to the survey, participants responded to questions 3 and 4. These were identical to questions 1 and 2 and allowed a comparison of responses (Figure 1 and 2). A group of 9 participants took the survey and engaged in a Second Life environment in the first group and 47 in the second (n=56). Ethics clearance for the study was granted, and all participants gave informed consent.

Rejuvenation Island

The island (http://maps.secondlife.com/secondlife/RejuveNation/76/197/22) includes simulated flora, fauna and sounds of an Australian bush and beach environment. Sounds of crickets and birds, and the waves washing onto a beach re-create a feeling of being in a real environment. Rivers host native catfish, the beach is inhabited by turtles, and a mixture of rocky and arid and rich eucalypt and grassland offer a range of experiences.

The Findings

As shown in figure 1 and 2, participants indicated that the immersive experience had led to enhanced feelings of wellbeing: “The beach and waves were really calming”. Responses indicated that the island produced strong positive feelings in respondents, akin to being in a natural environment: “The experience allowed an escape from stresses of real life. Had a calming influence and I forgot about day to day worries while in the virtual world.” These observations are consistent with the findings in Figure 1.

However, other feedback made it clear that a lack of familiarity with virtual environments presents an obstacle and diminishes the beneficial impacts of immersion, with one participant noting: “I found it frustrating and very unrelaxing. For students who are familiar with this type of experience it may be restorative”. A third response indicated another layer of complexity: that the experience of exploring and feeling alone in a strange place may bring to the surface anxieties related to perceived ‘real world dangers’ “…at first I felt relaxed with the sounds and everything but soon afterward (10mins) I became very anxious, I didn't want to explore.”

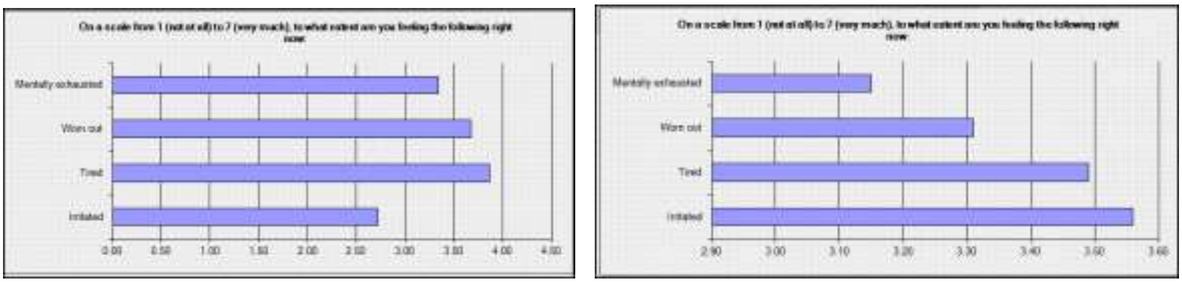

Figure 2: Affective Dimensions Prior to Immersion (Figure 1) and Post- Immersion

The figures give rise to an anomaly: post immersion (Figure 2), the level of reported mental and emotional exhaustion is lower, showing that the experience of immersion had led to a beneficial outcome. However, the reported level of irritation is higher post immersion. Respondents’ written and statistical responses signal that a lack of familiarity with the environment may have been the cause for this.

Conclusions

Immersive natural environments provide a means of restoration for adults and may present benefits for pre-service teachers who are unfamiliar with the natural world. The use of restorative virtual environments could be extended to schools in urban areas in particular, allowing pupils and their teachers to undertake field trips, and to relax in a calming and restorative context. In today’s classrooms where pupils with autism or attention difficulties find the classroom context disturbing, a Second Life retreat may offer a calming and restorative respite. For an immersive experience to be untrammeled by the impact of the unfamiliar, and by the transfer of ‘real world’ anxieties about being alone in a strange place, it is recommended that visitors be accompanied on their first visit, and supported until they become familiar with the navigation and interface of Second Life.

Implications of the non-traditional student becoming the traditional

Lorraine Fleckhammer
Faculty of Higher Education, Lilydale
Swinburne University of Technology

Helene Richardson
Faculty of Higher Education, Lilydale
Swinburne University of Technology

The challenge that the new digital technologies brings to education today is in the shift to online education. Online education, as delivered through Open Universities Australia, is open access, and affords entry into Higher Education for many non-traditional students who are much more diverse in terms of academic skills than traditional-entry students. The aim of this study was to improve academic writing skills, specifically in the correct use of APA formatting for psychology research reports. A 'low-stakes' assessment task worth 5% replaced optional referencing, formatting and report writing exercises. The results found no improvement in student reports (i.e., no increase in assignment grades) in the intervention year compared to three other years where the tasks were optional.

Keywords: non-traditional student, online education, psychology, open-access

Transformation of higher education in Australia

The higher education sector in Australia is currently undergoing a transformation in terms of delivery of undergraduate and, to a lesser extent, postgraduate programs. Driving this change are the new digital technologies which have afforded the shift to online education. An online learning platform constitutes a valuable and necessary addition to an institution's offerings and one considered vital to the sector's long term future. The increasing popularity of online delivery, with the subsequent rise in student numbers, facilitates both an institution's viability as an educational provider in difficult economic times and supports the Australian Federal Government's vision (as outlined in the Review of Higher Education) that by 2020 the proportion of Australian adults who hold bachelor-level qualifications rises from 29% to at least 40% (Bradley, Noonan, Nugent & Scales, 2008).

Student diversity in online education

Accompanying the growth in online delivery of tertiary programs is the increase of students via the non-traditional mode of entry (Cantwell, Archer & Bourke, 2001). An online program offers the opportunity for students who, due to geographical remoteness, restricted program options of nearest educational provider, work or family commitments, have limited opportunities to access on-campus programs of their choice (Ludwig-Hardman & Dunlap, 2003). In addition, rather than students with the traditional educational profile of recent secondary school completion (indicating a homogeneous level of academic competency) found in most oncampus programs, cohorts of online students are often very diverse in terms of their academic skills (ACODE52, 2010; Dearnley, 2003). Therefore, the online student can be an early school leaver or a degree-holder wishing to change careers or complete more studies out of interest, working full- or part-time and living in remote, rural or urban areas. Moreover, diversity is also seen in cultural and family backgrounds with many online students being the first in their family to engage in higher education (Cantwell et al., 2001).
A quantitative growth in student numbers combined with an influx of non-traditional (less homogeneous academic ability levels) students is confronting educators today. Schuetze and Slowley (2002) propose that "the challenge to all universities and other higher education institutions is to meet the educational needs of an ever more diverse group of learners" (p.310).

Open access to a Higher Education Psychology program

Open Universities Australia (OUA) is Australia's largest open-access education provider (Open Universities Australia, 2009), and as such, gives many non-traditional students a pathway into higher education and professional development. As the majority of OUA undergraduate programs have no entry requirements (i.e., ATAR score; previous study or pre-entry examination), student cohorts are very diverse in terms of their literacy, numeracy and computer skills.

One of the strongest areas of student growth is in the discipline of psychology. An estimated 15,000 Australian secondary school students are currently studying psychology (Cranney et al., 2009). There is every indication that many of these students will expect to complete an undergraduate or even postgraduate psychology course (Reece, 2010). Therefore, to meet the projected demand for tertiary level studies, an online program in psychology was developed by Swinburne University of Technology (SUT). Delivered through OUA, SUT's Bachelor of Behavioural Studies (Psychology) is an undergraduate program incorporating an externally accredited major in Psychology.

Given the popularity of the psychology program, and the open-access admission to OUA programs, SUT has experienced very large cohorts in its first year online psychology unit (PSS110 Introduction to Psychology 1 has had up to 1600 students enrolled in one study period). This suggests that many of our students in the introductory psychology unit may not have engaged in study for a considerable amount of time nor have they studied online.

What is happening with Swinburne's OUA Psychology program is no different from what is happening in higher education worldwide, with many governments desiring greater participation in higher education by an increased diversity of student populations (Sambell & Hubbard, 2004). However, the flexibility that open access education affords means that many students are enrolling in tertiary studies lack skills in one or a number of areas (e.g., time management, computer literacy, writing, literature searching) because they have not followed (for whatever reason) the traditional study pathway of completing primary then secondary school before enrolling in higher level studies. Students without a history of previous academic performance will find it harder to succeed with studies in higher education (McKenzie & Schweitzer, 2001). Recent secondary school completers should have a good level of computer skills, be comfortable accessing the internet, and have achieved an adequate level of literacy and numeracy skills (Dearnley, 2003). Regardless of mode of entry, skills deficits in these specific areas are a major obstacle to academic success (Dearnley, Dunn & Watson, 2006) and would appear to compound difficulties in learning more discipline specific skills.

Discipline specific skills

A fundamental skill for any student is the ability to communicate in the language of the discipline, which in psychology is the language of the scientist/practitioner. Written communication takes the form of highly structured research reports which relate, in a logical and clear manner, the results of an investigation into a topic or problem related to psychology. Students learn how to write research reports through a step-by-step process beginning with formatting, referencing, and literature search tasks. The American Psychological Association's (APA) Style is the standard to which psychology reports in Australian universities adhere.

The teaching of discipline specific academic skills is particularly challenging in the online environment. To aid students' learning of APA formatting Hall and McCune (2005) found that including learning objects (e.g., Flash animations) encouraged students to actively participate in learning the formatting rules because it breaks down large and complex chunks of material into smaller more manageable bit-size pieces, and mastering smaller portions of materials sets up learners for success and motivates them to excel in other areas. The authors used flash animations to develop their students' APA formatting skills (e.g., drag-and-drop, sorting, multiple-choice questions, and resource material). Student evaluations were very positive, and student papers showed improvement.

Swinburne's online psychology students are taught by teams of teaching staff using specific tools embedded in the Blackboard Learning Management System, such as, synchronous chat sessions and asynchronous discussion forums. Teaching staff lead online chat sessions and moderate discussion forums to develop students' conceptual and structural understanding of their written assignments (see Fleckhammer & Wise, 2011 for a review of the team teaching method). To alleviate some of the tutors time spent on guiding students in basic but discipline specific activities, students are provided with a series of tasks to complete, such as, referencing or report writing activities.

The referencing and report writing tasks, up to now, have been optional. However, teaching staff observed anecdotally, when grading written assignments, that many students clearly did not take up the opportunity to complete these activities. It was noted that referencing and structuring of reports was quite poorly done and as a consequence students were losing marks that should have been easily attained. Therefore, in the desire to see an improvement in the discipline specific skills of our online students a 'low stakes' assessment was introduced.

The theory behind 'low stakes' assessment

Low-stakes assessments are based on expectancy-value theory which proposes that if a task is perceived as interesting, useful and/or important it is more likely to be attempted. Cole, Bergin and Whittaker (2008) reported that students who perceived tasks as useful and important tried harder, and that trying harder, even on low-stakes tasks, results in better performance. Moreover, motivation theory proposes that the desire to be seen as competent is one of our innate psychological needs. Thus the consequence of students who achieve a high level of competence in specific skills is that they develop an increased level of self-efficacy in their ability to achieve success in other tasks (Ryan & Deci, 2000). Students themselves perceive regular low stakes assessments as helpful for their learning (Sturniolo-Baker & Loiacono, 2012).

The low stakes intervention

In the first study period of 2012, an intervention program was initiated specifically targeting first year, online psychology students' referencing, researching and report formatting skills. In order to gain maximum uptake, it was important that the tasks were brief and promoted as directly related to the written assignments rather than just as skill development (Dearnley, et al., 2006).

The set of six Active Learning Assessments (ALAs) was allocated 5% of the students' overall mark (see Table 1 below). Five marks were allocated to the ALAs for the following reasons:

i) it was approximately the value of marks allocated in each written assignment to the formatting and referencing criterion, and
ii) it would be easily achievable. Students are typically time constrained and out of necessity are very selective in their learning activities and thus the ALAs would immediately be seen as a mark of academic success.

The ALAs were available from Week 1 and students could work through all six at once to achieve the maximum score.

In the first year psychology unit (PSS110 Introduction to Psychology 1), students are required to write two assignments, which when combined, form a complete research report. The first of these assignments introduces students to the practical side of writing in psychology e.g., APA referencing, good/poor research differentiation, library/search skills. The ALAs would directly target these skills.

Assignment 1: An introduction section of a research report. This first assignment is worth between 15-20% of students' overall mark and specific marks are allocated for correct formatting and referencing. Students are given comprehensive feedback by their tutor which informs their second assignment (see Fleckhammer & Wise, 2010).

Assignment 2: A complete research report. This assignment contains an improved version of the first assignment (i.e., the introduction) as students will have taken on-board their tutor's feedback. As for the first assignment, marks are allocated for correct formatting and referencing.

The aim of the two assignments is:

1) to teach students about design, analysis, interpretation, and reporting of experiments in psychology,
2) to teach students how to communicate psychological research in a standardised (i.e., APA) format.

Aim of the study

The aim of this intervention was to determine if the inclusion of a set Active Learning Assessments (ALAs), which were previously optional exercises, now worth 5% of students' overall mark, would result in improvements to students written assignments (i.e., increased overall grades).

The intervention

For Weeks 1 to 6 activities were set which directly targeted both discipline specific skills and more general academic skills. For example, students were required to watch short videos on topics specific to the week's lesson content, answer questions related to the video and then contribute to a discussion forum by commenting on the content of the video. Other tasks required students to conduct a websearch for psychological research literature which met the requirements and for ethical research as per the Australian Psychological Society's Guidelines and report their findings to their tutor (via email) or add comments to a discussion board forum. Still other tasks required students to complete APA formatting activities to develop correct referencing and report structuring skills. Please see Table 1 for the series of ALAs for which students could earn up to 5% of their overall mark.

Table 1: ALAs for Weeks 1 to 6 from Study Period 1, 2012

Week 1	**Aim of ALA**
Watch short video on psychological research	Develop understanding of ethical considerations in psychological research
Conduct a web search to find a 'good' piece of research	Encourage good/poor research differentiation Develop computer literacy skills Develop literature searching skills
Complete referencing activities	Practice formatting references in APA style
Week 2	
Watch video on the brain	Develop understanding of biological basis of behaviour
Conduct a web search to find a piece of 'poor' research	Encourage good/poor research differentiation Develop computer literacy skills Develop literature searching skills
Complete referencing activities	Practice formatting references in APA style
Conduct a literature search two find 2 peer-reviewed journal articles which relate to the topic of the written assignment	Develop literature search skills Develop computer literacy skills
Week 3	
Watch video on the brain	Develop understanding of biological basis of behaviour
Conduct a web search and find out about Phrenology	Encourages critical thinking skills Develop computer literacy skills Develop literature search skills
Complete research report activities	Practice APA formatting conventions
Formulate two hypotheses related to topic of research report	Develop hypothesis formulation skills Develop critical thinking skills Develop writing skills
Week 4	
Watch video on stress management	Develop understanding of impact of stress
Complete report writing activities	Practice formatting reports in APA style
Week 5	
Conduct a web search to find information on repressed memories and hypnosis	Encourages critical thinking skills Develop computer literacy skills Develop literature searching skills
Complete plagiarism activity	Develop understanding of what constitutes plagiarism Develop critical thinking skills Develop writing skills
Week 6	
Complete dream activity	Gain experience in completing dream diaries
Watch short video on sleep	Develop understanding of different perspectives of why we sleep.

Students were allowed to undertake these activities at their own pace, however, they were encouraged to complete the activities in the week that they were set as many of the activities would directly support their first written assignment and consequently inform their second written assignment.

Results and Discussion

The response by students was enthusiastic to say the least. Tutors were swamped with an avalanche of emails, and discussion boards contained many more contributions by students than in previous iterations of the PSS110 Introduction to Psychology 1 unit. However, a true test of this intervention was to be whether there was an improvement in students' work by comparing Assignment 1 and Assignment 2 marks over four consecutive years.

The purpose of this intervention was to determine if the inclusion of the ALAs would result in a transfer of the skills learnt in these tasks to other areas. It was thought that this transfer of skills would be seen in an increase in the grades for two written assignments. It was expected that if a value was attached to a low-stakes task then students would more readily complete the task than if the task remained optional. This appears to be the case, as reported earlier, the response by students was enthusiastic and anecdotally many students reported how much they enjoyed the ALAs.

Comparison of Results Between Cohorts from 2009 to 2012

In terms of actual grade improvement, it was found that when comparing the 2012 results for the two assignments (see Table 5) with the 2011 results (see Table 4) that the results in 2011 (without the intervention) are better than the results in 2012 (with the intervention), in that, a greater percentage of the student cohort in 2011 achieved a grade of Credit and above in both Assignment 1 and Assignment 2 (without the intervention).

Taking into consideration that the 2011 cohort could have been a stronger cohort overall, comparisons among the 2009 (see Table 2), 2010 (see Table 3) and 2012 (see Table 5) cohorts find no real difference in the percentage of students who achieved a grade of Credit or above in both Assignment 1and Assignment 2. It is evident that the intervention is causing little impact on the marks achieved for the written assignments.

2009: The results for PSS110 Introduction to Psychology 1, first and second written assignments for Study Period 1, 2009 are displayed in Table 2. This Study Period had an initial enrolment of 270 students. Withdrawals and attrition resulted in a final active cohort of 130 with 99% of these students achieving a pass grade (only 1 student who completed every assessment failed).

Table 2: Distribution of grades for Assignment 1 and Assignment 2 - Study Period 1, 2009

Assignment 1				**Assignment 2**			
Grade	**No.**	**%**	**Credit & above**	**Grade**	**No.**	**%**	**Credit & above**
HD	6	3.8		HD	10	7.4	
D	24	15.3		D	33	24.4	
C	41	26.1	45.2%	C	38	28.1	60.0%
P	64	40.8		P	44	32.6	
N	22	14.0		N	10	7.4	

2010: The results for PSS110 Introduction to Psychology 1, first and second written assignments for Study Period 1, 2010 are displayed in Table 3. This Study Period had an initial enrolment of 776 students. Withdrawals and attrition resulted in a final active cohort of 338 with 98% of these students achieving a pass grade (6 students who completed every assessment failed).

Table 3: Distribution of grades for Assignment 1 and Assignment 2 - Study Period 1, 2010

Assignment 1				**Assignment 2**			
Grade	**No.**	**%**	**Credit & above**	**Grade**	**No.**	**%**	**Credit & above**
HD	29	6.3		HD	30	8.3	
D	99	21.7		D	97	26.8	
C	121	26.5	54.5%	C	106	29.3	64.4%
P	161	35.2		P	101	27.9	
N	47	10.3		N	28	7.7	

2011: The results for PSS110 Introduction to Psychology 1, first and second written assignments for Study Period 1, 2011 are displayed in Table 4. This Study Period had an initial enrolment of 637 students. Withdrawals and attrition resulted in a final active cohort of 265 with 99% of these students achieving a pass grade (3 students who completed every assessment failed).

Table 4: Distribution of grades for Assignment 1 and Assignment 2 - Study Period 1, 2011

Assignment 1				Assignment 2			
Grade	**No.**	**%**	**Credit & above**	**Grade**	**No.**	**%**	**Credit & above**
HD	23	6.1		HD	31	10.4	
D	79	21.1		D	82	27.4	
C	131	34.9	62.1%	C	104	34.8	72.6%
P	106	28.3		P	56	18.7	
N	36	9.6		N	26	8.7	

2012: The results for PSS110 Introduction to Psychology 1, first and second written assignments for Study Period 1, 2012 are displayed in Table 5. This Study Period had an initial enrolment of 396 students. Withdrawals and attrition resulted in a final active cohort of 141 with 96% of these students achieving a pass grade (5 students who completed every assessment failed).

Table 5: Distribution of grades for Assignment 1 and Assignment 2 - Study Period 1, 2012

Assignment 1				Assignment 2			
Grade	**No.**	**%**	**Credit & above**	**Grade**	**No.**	**%**	**Credit & above**
HD	11	5.7		HD	11	6.5	
D	34	17.5		D	49	29.2	
C	51	26.3	49.5%	C	43	25.6	61.3%
P	79	40.7		P	53	31.5	
N	19	9.8		N	12	7.1	

A comparison of the distributions can be seen in Figure 1. This indicates that the intervention is not facilitating transferability of skills learnt through the ALA tasks to the students' major written assignments.

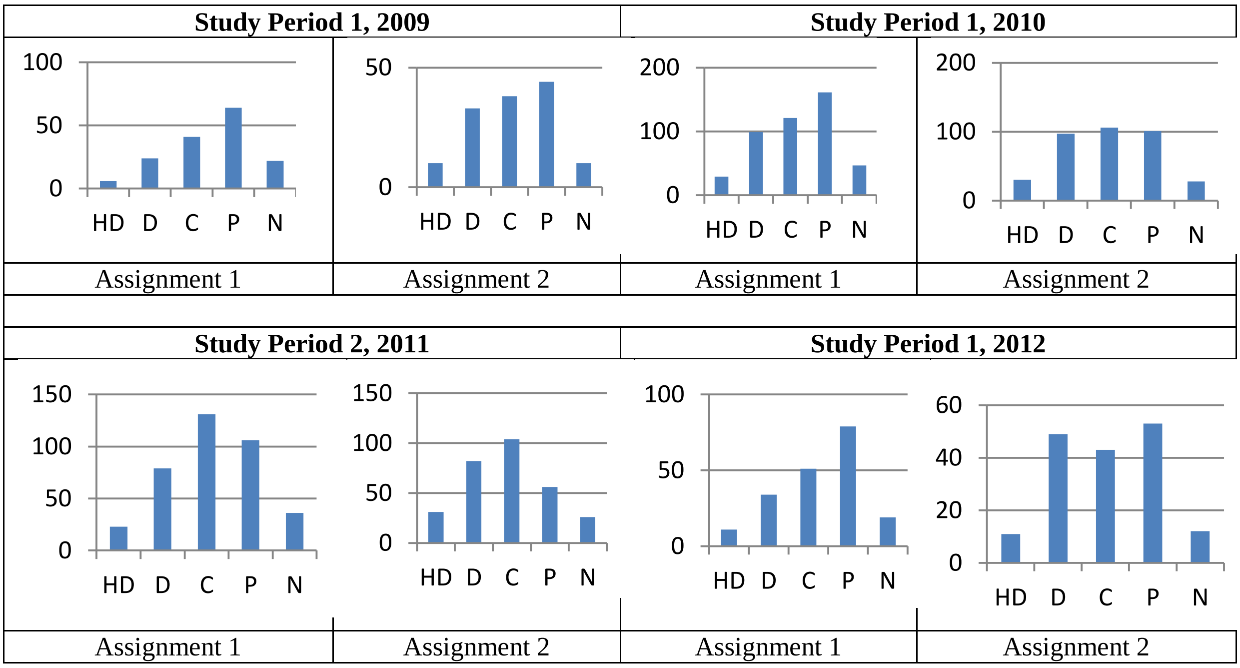

Figure 1: Distribution of Assignment 1 and 2 grades for 4 consecutive years

Concluding comments

The new digital technologies have provided access to higher education for many non-traditional students. As has been noted non-traditional students are very diverse in terms of academic literacies. In addition, non-traditional students are often time poor as they juggle work and family commitments and thus out of necessity are selective in their learning activities (Dearnley et al., 2006). When students, who may be time poor to begin with, are faced with new technologies to learn or learning new ways of using existing technologies, they may become overloaded with all that we expect of them. Cognitive Load Theory proposes that if learners become overwhelmed cognitively when they are expected to acquire complex skills, then they may fail to apply those skills in new situations (Kirschner, 2002). Learning activities which offer an easily achievable mark become the focus of the students' energies, sometimes to the neglect of other, more important but less achievable, elements in their course.

The skills that our students acquired in their ALAs have not readily transferred to their written assignments. Indeed, the inclusion of a further external demand on their time and cognitive capacity could well have interfered with their ability to produce their written assignments. Reducing external cognitive demands will actually lead to more learning (Bannert, 2002).

Rather than trying to increase discipline specific skills the intent is again/now to work on communication skills and to facilitate the development of students' relationships with their tutors and with fellow students. Students are more likely to succeed in their studies if they are socially integrated into the university and the more people they interact with the better chances of success in completion of their studies (Allen, 2006).

As Ludwig-Hardman and Dunlap (2003) observed, the challenge for online education providers is "not in recruitment but in retention" (p.1). Therefore, the sustainability challenge for us as online education providers is yes, to provide technical support for our non-traditional students who are new to Higher Education, but, more importantly to provide students with a sense of engagement and integration. The team teaching model, developed and used by Swinburne University (see Fleckhammer and Wise, 2011), facilitates student engagement in the online environment.

Feeling the Feed: Migrating from Threaded Discussions to Social Media

K. Martin 'Marty' Fletcher
International Business and Asian Studies, Griffith Business School
Griffith University

Michelle Barker
International Business and Asian Studies, Griffith Business School
Griffith University

This poster describes the ongoing challenges of using now 'traditional' threaded discussion boards, and details events leading to a simultaneous design experiment conducting an instructional activity in the traditional threaded discussion and a social media platform. It further describes a trial abandoning the legacy threaded discussion application completely in favor of the social media platform.

Keywords: social media, social presence, threaded discussions, online learning & teaching

Short History of Emergent Tools for Online Learning Communities

Threaded discussion boards (DBs) are a proven structure upon which to organise online community conversations along lines of content or learning objectives and are also useful for providing a repository which supports interactions and knowledge sharing. ASCII Bulletin boards predated the Learning Management System (LMS) (Greenlaw & Hepp, 1999). From there the Internet expanded to Web 1.0 including online learning systems,including for higher education (HE). In HE, LMS confined discussion boards became the engine room of online learning engagement. (Horton, 2000; Salmon, 2011). LMS DBs are not universally embraced. Many lecturers complain "they built it and no one came." Making DB participation an assessment item has been integrated by LMS vendors but engagement may be compliant and shallow. Orthodoxy about what instructional/learning design practices instigated within DBs has also emerged (Salmon, 2011; Goodyear and Zenios, 2007). Social presence and teaching presence has also been discussed (Lynch 2002, Schutt, 2008.). Other related themes to have been discussed include teaching team participation (Tseng, Wang, Ku & Sun, 2009) and interaction with students (Novais, Ramos, Nappo & Sigule 2010), modeling of desired academic communication styles and presentation of exemplary curricular artifacts (Morgan, Cameron & Williams, 2009). Not all DB innovations by LMS vendors have improved upon using simple threads which highlight newer posts, although there are improvements such as location of DB within learning paths, and Web 2.0 "rich user experience" (O'Reilly, 2008, p. 34) features. Asynchronous post of audio and video files can also be done. Currently, asynchronicity as provided by DBs may be losing prominence in respect to synchronicity in the context of multi-tasking (Klingberg, 2009). Even real time scheduled learning episodes through virtual meeting are losing to continuous narrative . Structuring of connversations and meaning is no longer the prime requirement as users are simultaneously immersed in multiple continuous feeds in which they have an interest, or at least, are interested, in. Social media is now ubiquitously apparent (Rainey & Wellman, 2012) but has had spottier penetration into the higher education space., As with all technologies introduced to teaching, sparse numbers of early adopters of blog platforms, twitter and Facebook applied to teaching and learning are in evidence (Rutherford, 2010). YouTube is used in face to face lectures. (Bonk, 2008) Universities have employed marketing professionals who have included social within marketing mix (Alkas, 2011).

Simultaneous use Social Media vs. Threaded Discussion Board

In a totally online offering of the Comparative Management Open Universities Australia unit with an enrolment of 240 students at the start, a conventional threaded discussion board strategy was built into the LMS site, with threads for support and queries about assessment, as well as a separate thread envisioned for each of the 6 modules comprising the unit headings where possible. Participation was minimal, as exemplified by the statistics provided in Table 1 for the Exemplar assignment criteria activity in Table 1.

Table 1: Postings and Participants on threaded forum preparing for Written Assessment task

Thread	**Threaded Forum Posts/Participants (non-instructor)**
Exemplar Paper	14/7
Criterion 1 Comparative Technique: Uses both cases to demonstrate knowledge, understanding and analytical skill	0/0
Criterion 2 Command of relevant concepts and facts for each case, including culture	2/2
Criterion 3 Managerial Insights: Reflection and application	3/2
Criterion 4 Written Communication: Language, structure, and scholarship	0/0

This activity was meant to be a high quality interactive experience in preparing for the major written assessment task based on practice in interpreting assessment criteria (Race, 2007) and social constructivist discourse between teachers and students concerning those criteria (Rust, O'Donovan & Price, 2010). An exemplar paper was created and attached to the main thread. Then, each of the four criteria contained for marking were posted as separate threads. Students were encouraged to read the exemplar paper (which by design had some strong and weak performances on different criteria) and post their opinion as to what performance level they thought was achieved and perhaps why they assigned it that mark. Then in keeping up with practice of reality media, there would be a 'big reveal' of the actual mark from the instructor as soon as 50 votes were recorded. In an attempt to garner more participation before the assessment was due, the same activity was run concurrently using Yammer (2012). Figure 1 shows screenshots.

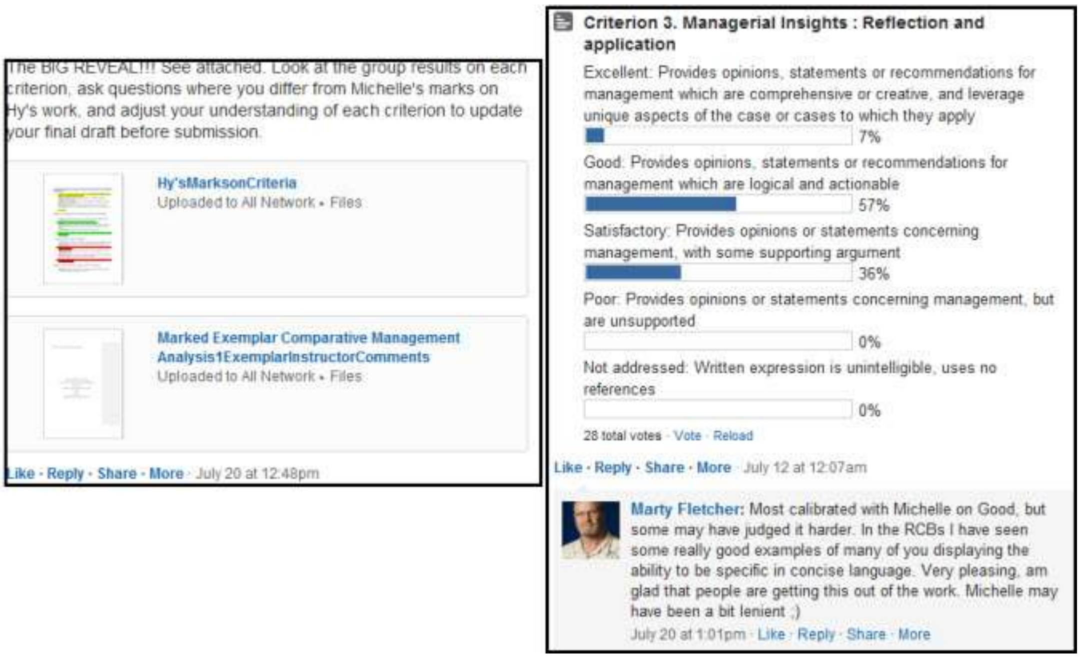

Figure 1: Exemplar Discussion Exercise in Yammer

Results were that, within one week after setting this up, there were additional 28 votes on each of the criteria, and some discourse (Rust et.al) on elaborating on the required qualities of achievement and their rationale. Although 2 students expressed preference for the discussion forum and only addition there were many positive comments about Yammer for instance of preference for its Facebook-like interface over the LMS discussion page set up. A number of students advised that they were already on Yammer in their workplaces. Total number of network members in this short window of time peaked at 101. From an instructor point of view, it was noticed that maintaining awareness and accessing the platform to see the interactions was much more fluid and could be done in much less time than required to monitor the discussion forum. Based upon the experience of using both the discussion forum and Yammer platform side by side, it was decided that in the following study period which is currently underway, Yammer would be used exclusively for discussion activities.

“It gave me a much more personal connection”: Student-generated podcasting and assessment in teacher education

Dianne Forbes
Department of Professional Studies in Education
University of Waikato

Elaine Khoo
Wilf Malcolm Institute of Educational Research
University of Waikato

Marcia Johnson
Student Learning
University of Waikato

This paper reports on a qualitative case study of an online initial teacher education class in New Zealand, exploring the potential of student-generated podcasts as a form of interactive formative assessment. Findings from interviews with teaching staff indicate that podcasting was useful for supporting multimodal learning valuing student voice and reflections. Podcasting enhanced the affective and relational connections in the online class, and empowered students to develop technical skills and confidence relevant in their teaching careers. As such, this study positions educators as future makers and as leaders in a climate of change. We suggest implications for student-generated podcasts in similar contexts.

Keywords: teacher education, podcast, student voice, online learning, tertiary education

Introduction

Web 2.0 tools such as podcasts and wikis provide new ways for students to construct, represent, develop, and report on what they understand. Drawing on a rich range of resources, in multimodal formats, students can manage their learning and express personalized understanding of concepts – using flexible and multiple formats – so that traditional concepts of space and time within the classroom are altered. This paper reports on a case study of student-generated podcasts in the context of an online initial teacher education class.

Student-generated podcasts as an approach to assessment for learning

A podcast is a digital media file that plays sound, is accessed from a website, and can be opened and/or downloaded to play on a computer or portable player (Salmon, Mobbs, Edirisingha & Dennett, 2008). While the use of audio recordings in education is not new, podcasting offers convenience and flexibility due to the relative ease of recording, editing and uploading, as well as accessing and subscribing to podcasts (Harvey, 2008). Podcasting is valuable for supporting learner flexibility and control, motivation and engagement, cognition and learning, and novel opportunities for teaching (Salmon & Nie, 2008).

Current trends in podcasting report on its use for lecture capture or course-casting (King & Gura, 2007), as a supplementary lecturer-initiated course resource, and its evaluation via traditional pencil and paper assessments (Hodges, Stackpole-Hodges & Cox, 2008). Such approaches tend to perpetuate a transmissive mode of teaching where podcasting is used in superficial ways to deliver old content via a new medium (Fischer, 2003). Selwyn (2007) cautions educators against “simply importing informal Web 2.0 applications into classrooms on the presumption of transforming formal education” (p. 7). There is a critical need to examine how educators can more successfully exploit the transformative potential of technology in tertiary teaching to in turn prepare students to learn, teach and lead within technology-enhanced environments.

A recent approach to enhancing class interactivity and maximising the potential of podcasts involves students developing their own podcasts as part of class assignments (Anzai, 2009). This approach increased student engagement with course content and understanding of ideas as opposed to regular text-based assignments (Royer, 2009). There are reports that students initially struggle with the time commitment involved in producing podcasts but eventually grow to be more comfortable with successive attempts (Crow, 2009).

The research context

This research used podcasts to enhance student reflection and to empower students to express and share their emerging understandings as teachers. The process of student-generated podcasts for assessment and learning is consistent with and informed by constructivist and sociocultural views of learning where students are active participants in their learning (Bell, 2011).

Professional Practice and Inquiry is a second year undergraduate course designed to provide students with an overview of educational psychology as a foundation for effective pedagogy. Students engage with key learning theories and themes of motivation, management, and assessment as integral to effective pedagogy. The class was offered online through Moodle and supplemented with two compulsory face-to-face on-campus sessions.

The lecturer hypothesized that podcasting could encourage reflection and articulation of understanding and had trialled the approach in a small ICT option class in 2009. Course participants used the open source programme, Audacity, to produce their podcasts, which they then shared with the class via Moodle. In 2010, the lecturer refined her pedagogical approach in order to implement the podcasting exercise on a larger scale in a core compulsory online class, with 80 students and two tutors, and added a second podcasting task to enhance students' reflective and formative experience. The lecturer had four purposes for the podcasting task: to acknowledge student voice, complement written modes of student learning with an oral presentation, complement traditional summative assessment with a participative approach, and empower students to actively engage in learning and teaching through ICT.

> The power is in the student voice and when students are podcasting. That's why I wanted to do this with our students podcasting, its not very much a leap for them to see that children can podcast too and that Audacity is easily usable by a child and it's the child's voice that can be out there (lecturer).

Each staff member (the lecturer and two tutors) initially generated a podcast in order to model the process for the students, and then guided them to produce two podcast episodes (three minutes each) for the purpose of "podcast-mediated reflective learning" (Ng'ambi, 2008, p. 133). The first episode related to students' observations of assessment approaches during a six-week teaching practicum, and the second episode entailed a synthesis of the students' emergent teaching philosophy.

The student-generated podcasts were compulsory but not graded tasks. Having generated the podcasts, students shared them with the class in Moodle. Students were asked to listen to at least two of their peers' podcasts within their groups, and to respond to their peers' ideas in the Moodle discussion forum. The staff participated likewise.

The staff and students received technical support from the university e-learning staff. Students were provided with detailed instructions and an online help forum within Moodle. This paper reports on the perspectives of the three staff, who co-taught the class. Student perspectives have previously been reported elsewhere (Forbes, 2011).

Research Design

The overall research question guiding the study was "How could student generated podcasting enhance assessment for learning in initial teacher education?" A qualitative, interpretive methodology framed the collection and analysis of the data, gathered from staff interviews. A constant comparison approach to data analysis generated emergent themes from the data (Lincoln & Guba, 1985). The perspectives of the participants in this study represent a convenience sample and although the findings cannot be generalised to a wider population, the data are sufficiently rich to inform similar tertiary teaching contexts. The project received Human Research Ethics approval from the University and all participants contributed on a voluntary basis.

Findings

Three key themes emerged from the data. All participants perceived that the podcasting had afforded a different way of teaching and learning, enhanced affective aspects of online teaching and learning, and increased student confidence with using technology.

Different way of teaching and learning

Participants liked the fact that podcasting offered a different approach in their teaching and supporting multimodal ways of learning:

> Within this online paper students do lot of text based discussion…so when lecturers are podcasting…students say ‘we are feeling a sense of warmth and humanity’, and they respond positively. So when we ask students to share their voices, they have an alternative means of expression, and the literature suggests and some of the students’ comments support the notion that reflection is supported through the verbal as well…. They can listen to the voices and some of the passion in their peers’ voices instead of just reading from a page (lecturer).

Participants also thought the podcasts enhanced student reflection in asynchronous settings:

> While the power of the spoken word is generally seen in synchronous aspects, here [in this paper] reflection is encouraged because it is not synchronous, students can revisit the podcast and can carefully think about and prepare for their podcast. They are not put on the spot… We’ve heard good things back from the students (lecturer).

Enhanced affective aspects in online teaching and learning

Participants thought the podcasting assignment humanized the online learning environment and enhanced students’ relational connectedness to one another.

> They (students) did comment on how hearing the tutors’ voices gave them a clearer sense of who they were and how different each of the tutors had approached their podcast. In an environment where you tend not to get to know people well enough, it gave a much more personal connection. Students liked listening to each other’s voices… I personally found the online environment difficult but found this experience humanises the name on the other end of the keyboard (Tutor 2).

Podcasting also valued student diversity in the course.

> It brings elements of culture to the fore, their [students] ethnic background might create a struggle, whereas when they speak their accents, they can stand proud and there is a diversity of these which come out nicely in podcasting, where it normally doesn’t in texts (lecturer).

Increased student confidence with technology

Participants commented on students’ increasing technical confidence and skill with generating and sharing their podcasts.

> It forced a number of students and even us (tutors) to engage with the technology, tools that we otherwise might not have used (Tutor 2).

The skills involved in podcasting were valuable and relevant to students’ future teaching careers, highlighting the possibilities for teachers as future makers and as leaders in a climate of change:

> They (students) can use podcasting in their own teaching practice. Some have shared their students’ work in their podcasts, which was really good. As the course is online media based, it only makes sense to include podcasting. They become more IT literate and confident as a result (Tutor 1).
>
> This is not just a removed learning activity; there is a life beyond this. These are skills they [students] can use in class (lecturer).

Discussion and implications

This study sought to understand how student-generated podcasts could enhance formative assessment in an online initial teacher education course. The findings indicated that the podcasting episodes were useful in supporting multimodal teaching and learning in ways that value students’ voices and reflections. They also incorporated a humanizing aspect in the online learning environment. Student empowerment and confidence to develop digital literacy required in their future teaching careers was another finding. These challenge conventional uses of podcasting for teacher-to-student transmission of course content. It stands to reason that teachers themselves must be active and competent learners, and in turn that there is a challenge here for teacher educators. Learners, whether they be school aged pupils, tertiary students, teachers, or teacher-educators, need to develop awareness of tools for learning. This includes the ability to locate, download and use software for particular learning purposes.

Three implications for practice follow. Firstly, lecturers need to design online courses so that podcasting is not merely added-on but enhances student reflection and learning. This study illustrates that an alignment of the technology to the course goals, activities, assessment and teaching philosophy was essential to model the transformative value of podcasting. A teaching belief consistent with constructivist and sociocultural tenets recognises the importance of nurturing participation and social connections. As an element of trust is essential in an online class climate where open student sharing and collaboration is valued, student-generated podcasts can contribute by affording "relational connection" (Harms et al, 2010, p. 76). Secondly, teacher educators need to make teaching decisions transparent. As part of the pedagogy of teacher education, "the often tacit knowledge of teaching needs to be made explicit in order to enhance teaching about teaching" (Loughran, 2006, p. 9). By valuing students' voice in the learning process, student teachers are encouraged to unpack teaching by explaining and sharing their own pedagogy. This openness about learning and teaching invites feedback, from peers as well as from teachers, which can lead to deeper thinking through formative assessment (Bell & Cowie, 2001). Finally, by being creative and adopting a problem-solving approach to the use of Web 2.0 technologies for teaching, learning and assessment, teacher educators can move beyond transmissive approaches. We can invigorate our own teaching and inspire students to learn and teach creatively using ICTs as part of their developing identity as teachers of the future, who in turn are preparing their pupils to be leaders of future change. This study has gone some way towards addressing these issues and informing other practitioners interested in adopting student-generated podcasts in similar contexts.

Patterns of Instruction: Using Screencasts in the Teaching of Textile Design

Angela Fraser
School of Art and Design
AUT University

Peter Maclaren
Centre for Learning and Teaching
AUT University

Rapid developments in technology over the last decade have enabled new processes for the printing of textiles. This has brought accompanying changes in textile design processes, and new challenges to the teaching of textile print design. Processes that traditionally involved hands-on physical interaction (e.g. screen-printing) have been transformed to become computer-mediated processes. Enabling students to acquire necessary software skills has proved a challenge in a time-constrained teaching environment. This poster illustrates the iterative development of screencasts that have allowed students to work independently on the acquisition of these software skills. Having students work at their own pace, with the ability to revisit material as required, has resulted in more advanced outputs than were obtained using a more traditional teacher-led approach.

Keywords: textile design, screencasts, self-paced learning

Context

In 2006 the Textile Design Lab was established at AUT University, providing access to digital inkjet printing for Art and Design students. In 2008 Digital Textile Design was established as a subject in the new Bachelor of Design Textiles for Fashion, and is now taught across several Design programmes as well as through short courses for industry training.

The "transition from fabric printing to digital textile design has required a significant leap from hand crafted, hands-on printmaking, to working entirely through digital design and print processes" (Fraser, Joseph & Cie, 2010). Adobe Photoshop has become a primary software tool, even though it is not specifically purposed for textile design. It has a number of functions and tools which can be adapted for creating repeating patterns, and for visualising prints, and has the advantage of ready availability both inside and outside class; a recent informal survey of students in a Fashion Elective indicates that a significant proportion of students (50%) had Photoshop available at home, and it is also available in AUT open access computer labs. The survey also showed that while 50% had prior learning with Adobe Photoshop, the remaining students had limited or no prior experience.

Teaching the use of software techniques can be problematic, particularly to groups of design students with varying levels of experience; as Houston and Lin (2012) note, there is the potential in a teacher-led classroom session that "advanced students zone out from boredom while struggling students get lost and often give up"; one-on-one teaching of technical skills had proven to absorb a large proportion of class time. Other research in textile design teaching suggests that student learning should be "active and hands-on, yet requiring time for contemplation and reflection", and that aural transmission is not a preferred delivery modality (Sayer & Studd, 2006).

Screencasts

The development of screencasts was seen as a way of responding to the varying needs of students; screencasts provide a way to present "digitally recorded playback of computer screen output which often contains audio narration" and to visually demonstrate procedural information to students (Sugar, Brown, & Luterbach, 2010). Screencasts (or animated demonstrations) provide "an easy and affordable way of producing multimedia instructional material that is authentic, situated, and motivating and can be exploited in various educational settings (in the classroom, self-paced, collaboratively, etc.) unlike other kinds of multimedia resources" (Palaigeorgiou and Despotakis 2010).

Adobe Captivate software has been used over the last three years to produce a series of screencasts. The initial pilot videos have been revised and refined each semester to improve the content and to encompass new software releases. Additional videos have been developed to cover more advanced topics. The collection is currently being modified and reformatted for delivery as an interactive resource via the iPad.

Outcomes

Digital printing technology has expanded the possibilities for design, allowing use of unlimited colours and fully photographic imagery. The acquisition of more advanced software skills has enabled students to explore visualisation of designs applied to garments or interiors; this allows decisions to be made about scale and print placement, alternative design solutions and colourings.

The shift to using screencasts to develop procedural skills has allowed the lecturer to focus class time on higher level concepts of design development, and on mentoring individual creative processes. This "inverted" classroom approach (Houston & Lin, 2012) has resulted in more advanced outputs than were obtained using a more traditional teacher-led approach. Examples of these outputs are displayed in the Poster.

Developing medical students’ information skills through online self-paced learning

Sarah K.J. Gallagher
Health Sciences Library
University of Otago

StudySmart is an online course designed for second year medical students at the University of Otago. This course was designed to replace a two hour library and information skills lab, and comprises a series of topics, tasks and quizzes. The course was built within the existing learning management system (LMS), Moodle. The content was made up of resources developed in-house as well as appropriate OERs from external sources. The online course was run as a pilot in 2012 and has involved three stages of evaluation: evaluative questions in the topic quizzes; post course reflective evaluation; and a focus group session. This poster presents the findings from the implementation and evaluation of this self-directed online course. The online course was designed to support the development of information skills in order to assist students with a significant summative assessment. The majority of students who completed the course reported a gain in knowledge and understanding about the topics covered, and reported that aspects of the course enhanced their ability to complete their assessment.

Keywords: medical education, medical students, information literacy, online learning, e-learning, library skills, LMS, OER

Background

This online course replaced a series of four, two hour labs run at the start of the second year programme. A variety of reasons lead to this decision including: an increase in student numbers meant there was a lack of rooms big enough to take four labs and the placement of the programme at the start of the year meant that the course was asynchronous with the students’ needs, that is, in preparing for their first significant written assessment. A proposal for an online solution was tabled and passed at the Early Learning in Medicine [ELM] Medical Education Committee [MEC] in September 2011. The course was developed and launched in May 2012 and remained open until 15 August 2012, just prior to the due date of their assessment.

Participation

The course was made available to all students enrolled in second year medicine. The course was voluntary. Students were informed of the course through in class visits and online communication via Moodle.

- A total of 154 students completed at least one topic in the course (54%)
- A total of 111 students completed the course in full (39%)

The entire class (n=287) was surveyed to evaluate the online course. This evaluation included questions aimed at students who did not attempt the course.

- 76% of the class completed the evaluation
- In addition, five students took part in an hour long focus group to further discuss aspects of the course

Findings

The majority of students responded favorably in terms of their perceived gains in knowledge and understanding of the topics covered in the course.

> I thought this was really helpful as I have often struggled to find papers that have been referenced for us to read quickly and easily, which hopefully now shouldn't be a problem. Showing us how to use the databases is a VERY good idea I believe as this is an important skill, especially for the lifelong learning in medicine and being able to access journals readily.

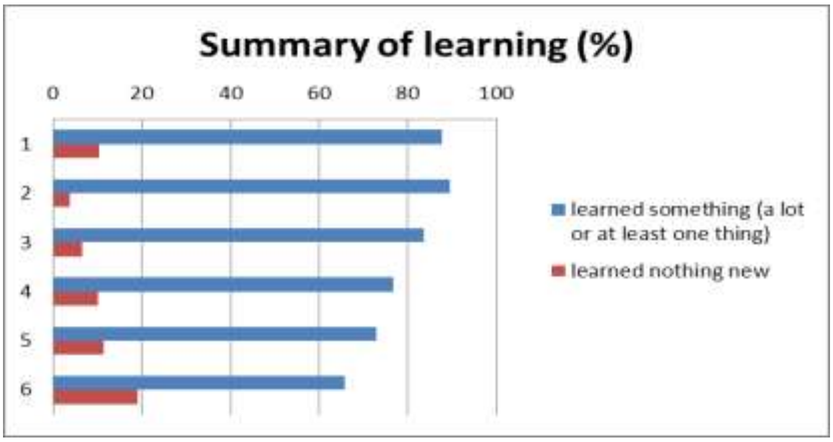

Figure 1: Level of learning reported by students on a three point likert-scale. The blue bars show the collapsed ratings for the top two points on the scale. The red bar indicates the proportion of responses to the lowest rating on the scale. Respondents indicated the level of learning achieved for each of the six topics (y-axis)

Most valuable aspects

Finding out about the databases the library subscribes to, Summon (discovery layer search tool), how to reference, and how to find full text articles using article linker were the most commonly quoted aspects of being of value to the students. The following are drawn from qualitative comments given by students completing the survey:

- "Everything was useful even though I had some knowledge before."
- "Very well laid out programme, easy to use etc. Good work!"

Least valuable aspects

There were fewer comments addressing negative aspects, but in general they included:

- Students commented that they had issues with the length of time it took to do the course. Students were not asked about the length of time taken to do the course but it is evident from Moodle how much time was spent. The course was designed to take no more than two hours. Preliminary data suggests much less time was spent on this course than the two hour lab it replaced.
- Many students found aspects of the first topic too basic, other comments mentioned some tasks had been covered already in prior learning.
- Students who had entered the course with a pre existing degree(s) found some material repetitive.

Conclusions

In the vast majority, students reported a gain in knowledge and understanding of concepts raised in the course. Students appreciated the ability to do the work at a time that suited them. This pilot suggests the course is a worthwhile development in teaching and learning in the medical curriculum at the University of Otago.

Developing sustainable practice with eportfolios: taking a blended approach?

Philippa Gerbic
Auckland University of Technology

Lyn Lewis
Auckland University of Technology

The last ten years has seen the introduction of eportfolios in many campus-based tertiary programmes. While the eportfolio literature has indicated the learning potential of eportfolios, the literature also documents technical, psychological and pedagogical concerns for students. The continued presence of these concerns raises questions about the viability or sustainability of eportfolios and their pedagogy within tertiary settings. More thinking is needed to address the issues around learner concerns in order to ensure sustainable practice in this area. This paper addresses the issue of sustainability by proposing that eportfolio learning can be improved by repositioning eportfolios within the concept of blended learning and drawing on existing blended learning research to address some current eportfolio issues. Two ideas for improving curriculum design and the student learning experience are discussed in the paper: (1) viewing the eportfolio and the face-to-face class environment as complementary and drawing on the strengths of both to enhance pedagogy and (2) ensuring that the eportfolio is not regarded as additive or supplemental but fully integrated with face-to-face classes.

Keywords eportfolios, blended learning, eportfolio pedagogy, Mahara, sustainability.

Introduction

The learning benefits of eportfolios are now well documented in the literature (see Stefani, Mason and Pegler, 2007: Butler, 2006). However, the research has also identified many challenges, especially for learners (Gerbic, Lewis &Md Amin, 2011). Eportfolios are still regarded as a disruptive technology (Cambridge, 2102) and this position, combined with ongoing challenges raises issues for the future in developing a sustainable eportfolio pedagogy and practice within tertiary institutions. The notion of sustainability here refers in a general sense to the idea of endurance and existence for a prolonged or extended period of time as opposed to something that is short-lived or ephemeral. A sustainable pedagogy and practice is necessary to ensure that this technology is not marginalised and is able to make a useful contribution to learning.

In campus-based programmes, eportfolios have often been introduced as an ‘add on’ in a learning environment which incorporates both face-to-face and online technologies such as a learning management system and various Web 2.0 tools. The literature indicates that the dominant focus of research and practice has, quite sensibly,been on learning issues for students (Gerbic et al, 2011). Given that eportfolios are often used in blended learning spaces, there has been little consideration of the literature on blended learning. This aspect of eportfolios is therefore unexamined, so the purpose of this paper is to (1) discuss the issue of sustainability with eportfolios at a classroom level and (2) draw from the blended learning literature to make proposals for better integration of eportflios within face-to-face/ blended learning settings.

This paper arises from our introduction of the Mahara eportfolio in 2009 which was accompanied by a research project focused on student perspectives, which included both qualitative and quantitative approaches (Gerbic et al, 2011: Lewis & Gerbic, 2011).   Its focus is on learning rather than evidential or showcasing portfolios and at the classroom level rather than that of the institution.

What are the sustainability issues with eportfolios at a classroom level?

In her research into sustainability of grass-roots elearning initiatives, Gunn (2010) proposed three conditions for sustainability (p. 90) which were (1) a benefit to teaching and learning in a course of study

(2) potential to expand beyond the original site and (3) continuation not being dependent on a few initial enthusiasts. She found that not all elearning initiatives were in fact sustainable and went on to identify key barriers or challenges for teachers and institutions. These included the impact of discipline cultures, where there was little interest from colleagues in elearning pedagogy and discipline-focused research was valued. Other barriers included high workloads, limited access to institutional support and resources and insufficient career rewards.

From a body of research which has investigated student perspectives of eportfolios, challenges for students (and therefore teachers) at the classroom level are now clearly identified. We have discussed these previously (see Gerbic et al, 2011) but they are summarized below in Table 1.

Table 1: Student perspectives of eportfolio challenges

Technical	- Frustration around learning to use the technology. - Insufficient training and support avenues. - Problems with remote access, broadband access. - Time taken to scan and upload documents. - Software issues (Lin, 2008; Singh & Ritzhaupt, 2006, Tosh, Light, Fleming & Haywood, 2005; Kaliban and Khan, 2012)
Psychological/ Affective	- Lack of motivation and 'buyin'. - Confusion and anxiety, especially where assessment is concerned and about purpose and audience. - Difficulty adapting to change, especially if the eportfolio is introduced midway during a course. - Coping with inconsistency across the programme, e.g. assessment, standards, teacher attitudes. (Tosh et al, 2005; Wetzel & Strudler, N, 2006; Singh and Ritzhaupt, 2006; Lin, 2008; Wetzel & Strudler, N, 2006; Pincombe, McKellar, Weise, Grinter, & Beresford, 2009)
Pedagogical	- Lack of understanding about the role and potential value of an eportfolio i.e. the eportfolio is not meaningful. - Not understanding new pedagogies which accompany the introduction of the eportfolio. - Development of reflective skills is difficult in many programmes and forced or overdone in others. - Adapting to new forms of assessment, e.g. linking evidence to course and professional outcomes. - Adapting to new learning activities such as collaboration, giving and receiving feedback. - Being independent learners and acting more autonomously. - Plagiarism. - Accurate representation of professional self. (Woodward & Nonphy, 2004;Tosh et al, 2005; Ayala, 2006; Lin, 2008; Singh & Ritzhaupt, 2006; Carroll, Maukauskaite & Calvo 2007; Kaliban and Khan, 2012)

These student concerns raise challenges for teachers (and institutions). It is worth noting that most of the studies in Table 1 report a single semester implementation where it is reasonable to expect various student concerns, especially regarding use of the technology. However, Thornton, Ferris, Johnson, Kidwai & Ching (2011) found major student frustrations around using the technology still present in an eportfolio programme that had been in existence for six years. The authors viewed these technology issues as a distraction for students and an impediment to achieving the learning values of reflection and personalisation for their students. Student concerns and challenges regarding the technology, the time involved and the place of reflection were also identified in another study of eportfolios in mature practice settings (Wetzel & Strudler, 2006). The persistence of technology and other fundamental issues over time raises questions about the sustainability of eportfolios. While the literature documents the benefit of eportfolios for learning (Gunn's first condition for sustainability), the research indicates that there is little evidence for the second and third conditions i.e. the potential to expand beyond the original site and where continuation is not dependent on a few initial enthusiasts. If eportfolios are to take their place as a valuable and sustainable learning pedagogy, then we need to think of new ways to address the concerns presented to us by students so that more programmes and more teachers take up this pedagogy.

Regarding the technology challenges, much of the research discussed above indicated that programmes were using a variety of Web-based tools as eportfolios and it may be that technical issues will be ameliorated as more institutions introduce dedicated eportfolio platforms such as Mahara. The other factors that may improve perceptions about the technology are the increasing comfort of both students and (younger) teachers when working with Web 2.0 tools and activities, although it is clear now that NetGen students don't necessarily adopt learning technologies with ease.

With regard to the psychological and pedagogical issues described in Table 1, new pedagogic approaches could be beneficial. In many of the published reports above, there is a concentration on the special characteristics of the eportfolio and less on the broader learning environment. However, there is now some recognition of the importance of a wider perspective. Thornton et al (2011) noted student perceptions of a lack of integration where they regarded the eportfolio as an 'add-on'. They also noted that teachers were inconsistent in their use of the eportfolio and wondered whether they also regarded it as an 'add-on'. The authors concluded that a significant issue for future development was integration of the strengths of the eportfolio into the curriculum and that the long term impact of the eportfolio would depend on this. As a relatively new endeavour, eportfolio practice has not developed a curriculum design framework which seeks to fully integrate eportfolios within a blended learning environment where face-to-face is a long experienced component for students. The balance of this paper contributes to this issue of a curriculum design framework by drawing from blended learning experiences to provide a starting point for the framework. This approach of rethinking eportfolio curriculum design has the potential to increase the sustainability of this pedagogy.

Insights from the blended learning literature for developing a sustainable eportfolio pedagogy through curriculum design.

The features of blended learning have been widely discussed by researchers, with most definitions revolving around combinations of temporal and virtual learning spaces (Stacey & Gerbic, 2009). One of the most widely quoted definitions is that of Garrison and Kanuka (2004) where they describe blended learning as both a simple and complex concept involving "the thoughtful integration of classroom face-to-face learning experiences with online learning experiences" (2004, p.96). The definition is useful in the sense that it provides a description that is sufficiently general at a conceptual level but also capable of responding to the wide variation of localised teaching and learning settings. The definition also goes beyond technology and reminds us of the essential role of pedagogy. While they and other writers advocate for the transformational potential of blended learning, there are also accounts which document challenges for learners (Molesworth, 2004) and teachers (Hanson, 2009) , however, it would appear that the widespread existence of blended learning indicates that Gunn's (2010) three conditions of sustainability are likely to be satisfied.

The literature to date has mostly considered blending face-to-face spaces with various online spaces provided through Learning Management Systems or other Internet-based or Web 2.0 tools. Now that eportfolios are becoming part of blended learning spaces, discussion needs to focus on how a pedagogy of blended learning might be developed which includes this new technology. The balance of this paper addresses this issue by drawing on blended learning research in two areas: firstly, working productively with the differences between the two environments and secondly, developing an integrated approach.

Working productively with the differences between the two environments: A complementary approach.

What is important is understanding the differences of the two learning spaces in terms of their strengths and weaknesses and then being able to create learning designs which work to the strengths of the two environments.

Many writers have discussed what the 'e' brings to a portfolio with much of the literature emphasizing its pragmatic strengths. The digital nature of the eportfolio provides a central storage space, which is highly portable and with organisational and searching capacity. It provides 'anytime anywhere' access for its owner but also its readers, and it is capable of storing and presenting a much wider range of media beyond that of paper. The technology offers flexibilities, both in terms of enabling multiple views for different audiences and providing multiple pathways for readers. It also offers opportunities for online interaction and feedback (Abrami and Barrett, 2005: Challis, 2005; Butler, 2006). Arising from the digital nature of the eportfolio, there are also efficiencies in assessment such as saving marking and feedback time and communication advantages by helping teachers and students to remain connected through 24/7 access (Strivens, Baume, Grant, Owns, Ward& Nicol, 2009).

The digital nature (and strengths) of an eportfolio has extended its use beyond that of traditional showcasing and assessment purposes and has enabled the eportfolio to be used in a wide range of learning settings. Some of its strengths here build on the nature of portfolio learning generally and others are now emerging which are more closely connected to the digital character of the technology. Much of the literature on the use and strengths of portfolios is situated within teacher education literature. What lies at the heart of a learning portfolio is supporting the development of professional skills and capacities through reflective processes, especially those which seek to assist new professionals connect theoretical concepts from the university with an emergent practice in a professional field. Zeichner and Wray (2001) also argue that reflection via portfolio construction may lay the foundation for 'habits of reflection and analysis' (p.614) which persist beyond graduation. This construction process can be regarded as a social practice where the role of reflection is to assist the learner's understanding of a professional community, and its norms, values and standards (Darling, 2001). The quality of critical reflection that occurs within portfolios can be problematic and Orland-Barak (2005) observed that it is not the construction of a portfolio that guarantees reflection, although critique is more likely to arise whenever learners collaborate and are exposed to other opinions.

Research into online discussions indicates that digital environments have some strengths which can support reflection. Asynchronous online environments provide time to reflect and a text-based format that may also support the construction of well shaped ideas (Garrison & Anderson, 2003). In their research, Oner and Adadan (2011) found that while the 'anytime anywhere' aspect of the eportfolio made it easy for the teacher and students to provide feedback, what motivated the students to do better work was the fact that others were going to look at their reflections and give them feedback i.e. wider publication than would normally occur with a paper portfolio. The researchers concluded that teachers should be "most concerned with what blend of activities would support reflective thought processes" and the technology was only one aspect (2011, p.489).

The literature is now starting to provide some instances of the ways in which the characteristics of an eportfolio mentioned above might be regarded as strengths for learning (as opposed to assessment or showcasing) . Four areas of identified strength are:

- The ways in which an eportfolio can support a student's learning as a formative process. Because eportfolios are dynamic and living documents, they can assist development over time whereas a paper portfolio operates more as a product (Oner and Adadan, 2011). This role has been widely recognised (e.g. Barrett, 2005; Jafari and Kaufman, 2006; Lin, 2008; Bolliger and Shepherd, 2010) and some authors are now arguing that eportfolios can be used to support the learning process at the same time as evaluating outcomes or standards (Chau and Cheng, 2010).
- There is evidence in some disciplines that eportfolios can support new ways of thinking, especially relational and evidential thinking around the selection and justification of artefacts against end points such as goals. Ring and Foti (2006) found that this was transformational for students because of the need to make numerous connections with their practice and it also helped them to understand the complexity of being a teacher and the interplay of numerous professional issues in teaching. In a small scale study of postgraduate students, Wang (2006) found that students highly valued the synthesis that was required because it enabled them to develop meaning from the whole experience. The ability to support holistic approaches is an important strength of eportfolios.
- Provision of interaction and dialogic support processes means that eportfolios can enable socially focused learning and growth of learning communities. The ability to give and receive feedback amongst peers has the potential to create, not only develop, professional skills, but also to create peer scaffolding opportunities and new zones of proximal development (Vygotsky, 1978) for students. Lin (2008) found that students appreciated this aspect of the eportfolio which has the potential to promote the kind of critique that Orland-Barak (2005) claims is missing from reflection.

- There is now emerging evidence that working with eportfolios is motivational for students because they can make representations of their professional selves in a way that is personal but also highly creative. Woodward and Nonphy (2004) found that, for students, thinking about their representations, and making the most of the flexibility of an eportfolio and its interactive opportunities resulted in a deep level of engagement . Cambridge (2008) has also endorsed the value of eportfolio as a "well integrated and complete representation of the creators sense of themselves" (p.1239) where the key issue is "the negotiation of the tension between the personal and professional" (p.1239). The eportfolio is therefore well placed to respond to a wider trend towards personalisation in technologies and establish a basis for the development of a professional (or otherwise) digital identity.

There is very little direct comment on the weaknesses of eportfolios and the best source is probably the research based on student perspectives which is discussed earlier in the paper. There is also little research on teachers' perspectives on this point. Peacock, Gordon, Murray, Morss and Dunlop (2010) have identified some teacher concerns being the stability and robustness of eportfolio systems, together with teachers' recognition of their limited understanding of the technology and the way in which it might be used to support reflection and development.

The strengths and weakness of the face-to-face classroom are now widely recognised. Some of the key dimensions in overview (Gerbic, 2010) are:

- The richness of the environment visually and aurally means that students and teachers are able to build rich pictures of the class. Being able to see and hear other learners and the teacher provides a sense of authenticity which lays a good foundation for the development of affective elements such as trust, commitment to a community. However, the same proximity can inhibit less confident class members and limit face-to-face critique.
- The synchronous nature of the environment creates rapid flows of information. This supports exchanges of ideas, creativity and developmental energy which can be motivational for learners. However, the time is finite and ideas can be superficial. Students who speak English as a second language may find it difficult to keep up with the conversations.
- The speech-based nature of the environment makes it quick and easy to participate and build a large body of ideas and exchanges. However, the conversation is ephemeral and there is no class record and class members must be sufficiently confident to speak.

Some of the strengths and weaknesses of eportfolio and face-to-face learning spaces have now been discussed. If the two learning spaces are regarded as complementary, then learning designs can build on the strengths of both environments. There is emerging recognition of this in the literature, however eportfolios are often positioned as an 'add on' or are supplemental to the face-to-face class. What is needed is more integration of eportfolios and the last part of this paper makes some proposals on this point.

Purposeful integration of eportfolios with face-to-face classes for more blended learning.

Student perceptions that eportfolios are an "add-on" (Thornton et al, 2011) reflect similar student concerns in blended learning environments (Gerbic, 2010). To address this issue, an eportfolio curriculum framework should build connections between the two environments to create a learning context which communicates the importance of both learning spaces to students. Bluic Goodyear and Ellis (2007) argued that in blended contexts, there is a tension between working with the different parts of the system and the blended environment as a whole and suggest that more holistic approaches be taken which stress coherence and alignment. The blended learning literature provides a number of suggestions and three of the most important are discussed next. The eportfolio literature also refers to 'embedding' eportfolios (e.g. Brett, Brant, & Sutherland, 2007; JISC, 2008; Hallam, Harper, McGowan, Hauville, McAlister, Creagh, 2008). This seems to indicate integration at a higher level than that of a blended class and focuses on the inclusion of eportfolios across entire programmes. To create a pedagogic connection between face-to-face classes and eportfolios (and any other online technologies), three strategies are next discussed.

1. Use a redesign rather than an 'add-on'approach.

The desirability of using a 'clean slate' approach where a course is viewed as a unified whole rather than disparate elements is now widely acknowledged in the blended learning literature (e.g.Garrison &Vaughan , 2007; Kaleta, Skibba, & Joosten, 2006). A foundational issue in a redesign is that of the creation of a portfolio pedagogy, which has been documented especially through the development and use of teaching portfolios in teacher education (Zaichner & Wray, 2001). This portfolio concept is quite elastic and draws on constructivist and experiential approaches to learning and as such, is ideally suited to many contemporary professional programme outcomes. It also provides a framework which enables learners to explore tensions within their development as professionals such as that between theoretical concepts, professional expectations and community practice as well as those arising from reconciling the personal and the professional (Cambridge, 2008). A portfolio pedagogy can also include a community environment for learning and Kaliban and Khan (2012) describe seven learning and assessment activities which might feature in such an environment.

Redesign can also enable better alignment between the learning outcomes and assessment for the course. The benefits of authentic assessment are now recognised within the eportfolio literature (Stefani, Mason and Pegler, 2007) and there is evidence that while students find the task of selecting and justifying artefacts demanding, this kind of assessment is motivational because it creates connection with a professional community and more awareness of its expectations, values and practices (Ring and Foti, 2006). In their research, Kaliban and Khan (2012) found that students liked their eportfolio assessment because it was more practical, transparent and comprehensive than the usual tests and essays and it also contributed to their development as classroom teachers. The authors make a valuable contribution to the establishment of an eportfolio pedagogy in their discussion of what the assessment concepts of validity and reliability might mean in an eportfolio context.

One of the major challenges which students have identified is that of workload. This is also reflected in the blended learning literature where Kaleta et al (2006) talked about the emergence of a 'course and a half syndrome' (p.127) when online technologies are added to face-to-face courses. This means that teachers have to resist the urge of adding the portfolio activity to an existing programme without any commensurate reductions. Kaliban and Khan (2012) suggest that to avoid student overload, face-to-face class time could be reduced and substituted with eportfolio activities.

2. Wrap face-to-face class activities around the eportfolio (and vice versa)

This aspect of redesign focuses on ensuring that the eportfolio is not parallel or supplemental but closely interwoven with class activities. The extent and the way in which this might occur will vary with the course and according to teacher beliefs. Littlejohn and Pegler (2007) provide a three level framework for blended learning spaces which enables teachers to plan for iterative cycles of learning across different spaces and timeframes while using different media. They also make provision for 'strong' and weak' blends (p.29) which would allow teachers to vary the extent of face-to-face and in this case, eportfolio time and activities within the learning programme. Garrison and Vaughan (2008) also provide a variety of scenarios for blending and tend to emphasize the face-to-face class as an anchor for online activities with their framework which focuses on activities before, during and between face-to-face classes.

The way in which the teacher treats the eportfolio in class is significant because, along with assessment, what the teacher gives attention to in class communicates its importance to students. Class time can therefore be used not only to introduce the concept of eportfolios but also to discuss its relevance for student learning and development, special features and how they will be connected to what happens in class. This might include linkages between some of the course topics and eportfolio activities or regular feedback in class on progress and issues (Oner and Adadan, 2011). This could be carried out by the teacher at a general level which could reduce teacher workload, or more specifically, by small groups of students presenting works- in-progress and providing feedback (Oner & Adadan, 2011). If a learning community approach is to be used, then the characteristics of face-to-face classes with their synchronicity and rich aural and visual character can lay the foundations for eportfolio activities such as peer feedback which require openness, trust and disclosure.

Most importantly, face-to-face classes should include activities which develop the students' skills and confidence for the online activities (Gerbic, 2006). Ellis, Goodyear, O'Hara and Prosser (2007) observed that just because students have often participated in class discussions, doesn't mean that they know how discussions contribute to their learning or how to engage in them effectively – online or otherwise. The same point can be made for eportfolio skills. The need for teachers to discuss the role and rationale for eportfolios has been identified above, but attention is also needed to identifying and developing eportfolio skills in class. Three of these that are regularly mentioned in the literature are the ability to:

- reflect (eg Lin, 2008; Abrami and Barrett, 2005) and
- give and receive feedback (Wang, 2006; Vernazza, 2011) and carry out self and peer assessment (Stefani, Mason & Pegler, 2007) and
- set goals, and monitor progress through relating and connecting evidence (Bolliger & Shepherd, 2010; Ring & Foti, 2006).

There are many models of reflection and reflective activities, especially in the teaching and health literature where they are regarded as one of the cornerstones of professional practice and this may be one of the reasons for the widespread adoption of eportfolios in these fields. However, there are still issues about the quality of reflection (Orland-Barak, 2005: Oner and Adadan, 2011) and it may be that this activity needs to be better integrated and addressed within a face-to-face class setting as a preparation for eportfolio work. Where reflection and feedback activities are not normally part of the student learning experience, then there are added stresses for students as they struggle to understand the benefit of these activities and how to carry them out (Vernazza, 2011). More time in class discussing the role of these and practising them might also improve students' eportfolio reflection.

3. The Role of the Teacher

The advent of learning technologies has already indicated new roles for teachers in blended learning spaces and that of course design or redesign has already been identified. Academics have been required to shift their focus from their discipline to new pedagogical approaches and consider constructivist approaches. These may provide an impetus for change with Kaleta et al (2006, p.137) commenting that "teachers need to be prepared to leave behind their previous constructs of what a teacher is, and to anticipate how the new model redefines them, their course and their students". However, equally this may create concerns about the displacement of teachers' authority and their role as knowledge providers (Hanson, 2009).

Cambridge (2012) argues that if eportfolios are to achieve their transformative potential, then changes are needed not only with regard to practice but also with regard to responsibilities. On the role of teachers he comments, that they must move beyond taking responsibility for learning outcomes and embrace broader matters such as life long learning, developing autonomy and self-direction and connecting university discipline learning with broader community and professional contexts. He identifies two areas where teachers might start - reflective practice and using technology to provide a record of their experiences, career and identities. Some teachers may be reflective practitioners already and familiar with this practice. Documenting experience and identity may be rather new for others, and will create challenges for teachers, however it will provide good material and a model for discussion with their learners.

Conclusion

The learning benefits that have been identified for eportfolios make them a promising technology. However, the research on student perspectives indicates that there are challenges with this new technology and its associated pedagogy which raises questions about how Gunn's (2010) second and third conditions of sustainability might be met. In order to move eportfolios beyond their original enthusiast adopters and onto wider programme and teacher adoption, a new approach is needed.

While improvements to the technology itself are beyond the brief of this paper, there are opportunities for developing better eportfolio pedagogy and practice. We have argued in this paper that eportfolios should be repositioned within a blended learning framework. Drawing on the existing research and literature, this would comprise a complementary approach which uses the strengths of the two learning spaces and purposefully integrates eportfolios with face-to-face classes. We suggest three avenues for this - curriculum redesign rather than an additive approach, wrapping face-to-face classes around the eportfolio and vice versa, and reviewing the role of the teacher. Further research is needed to examine the potential of such approaches to create a sustainable eportfolio pedagogy.

Using Mobile Learning to Facilitate Early Engagement

Paul Goldacre
La Trobe University

Mobile Learning is an emerging learning and teaching field and the strategies for conceptualising, designing, developing and evaluating the mobile learning experience are embryonic and evolving. This paper describes the process of development of a mobile learning experience for use on an iOS device with 'engagement' and 'learning' sitting at the core of the research, design and development of the project.

Background

La Trobe University's attrition for 2009-2010 was 18.2% of its domestic commencing students.[1] Many studies have found that student engagement and a positive first year experience are crucial to student retention.

Reports from 1994-2009 have found that only around 50% of first year students feel like they belong to their university campus."(James, 2010) Pitkethy notes that "Studies of Australian first year students show that initial experiences on campus are important, and influence students' persistence in higher education." (Pitkethly, 2001) We know that students who are engaged, have a sense of belonging, know how to access university resources have a higher possibility of finishing their first year of study at University. (Horstmanshof, 2011).

An increase in student retention of 1% of the 37,000 students studying at La Trobe, at $25,000 per student, translates into $9,250,000, a significant source of university funding and crucial I would say to maintaining and resourcing further research and education programs.

La Trobe University's Melbourne campus is differentiated from most universities by the enormous space that it occupies and the expansive natural surroundings enclosed by a moat, created from the Darebin Creek. Puzzlehunt was developed as a Gamification concept to playfully orient new students to La Trobe's spaces, facilities and resources. A quote from an article written on the project states, *"La Trobe's Melbourne campus spans over 2000 hectares encompassing more than 40 buildings and can be a daunting experience to navigate for new students making Puzzlehunt an ideal activity.[2]"*

Mobile Learning Experience

The mobile learning 'Puzzlehunt' idea was conceptualized at an Apple University Consortium (AUC) workshop in Brisbane. The App was adopted and developed within the Faculty of Humanities and Social Science, at La Trobe University as a mobile "O" week first year experience, designed to playfully familiarise students to key social, resource and learning spaces and to engage students early with peers and staff. Of the five faculties at La Trobe, the Faculty of Humanities and Social Science is the most curriculum diverse faculty, ranging from Shakespeare, Town Planning, Hindi to Photo Jounalism.

The concept of a "Treasure Hunt" or "Great Race" as a University Orientation week activity is not an original concept. It was reported that one Victorian University paid $30,000 to contract an external organisation to run an O week Treasure Hunt style of activity. For a similar level of funding the faculty of Humanities and Social Science developed a mobile learning App to facilitate a 'gamified[3]' student learning experience on an iPad which included a class set of iPads and the cost of developing the App. An additional cost benefit is games or learning experiences can be adapted for other purposes, for example "Future Students" have developed games aimed at providing year 7 & 8 students with a Puzzlehunt appropriate for their age. Also when new students are not using the iPads for Puzzlehunt, they can be utilized for other innovative learning within the faculty.

Intended Learning Outcomes

The initiative introduces new students to the diversity of faculty subjects through a variety of activities designed game designed to playfully familiarise students to key social, resource and learning spaces and to engage students early with peers and staff (with an element of learning built into each activity.) The intention is to give students a taste of the faculty and to familiarise them to key locations, which might assist them in their new environment (e.g. Careers Office, Library, Sports Centre, First year coordinator.) Games can also be customised to assist students to initiate peer and academic relationships early in the university year.

The underlying objectives of the project were to;

- Engage students with their environment
- Encourage peer relationships
- Get to know University environment
- Develop sense of belonging
- Promote staff/student relationships
- Provide a playful experience

The Game

The Puzzlehunt project has the formative goal in playing a part in building student engagement. The project provides new students with a mobile learning experience, combining smart phone technology with a live scavenger hunt with a learning objective built into each activity.

The game starts with new students receiving a ticket to “Puzzlehunt”. The ticket has a QR code and instructions on how to scan it. The QR code invokes a short introductory movie taking the student into the Puzzlehunt space.

During “O” week, students take their ticket to a central meeting place, where they are lent an iPad loaded with the game and a drop-proof case. The game provides students with choice therefore directing them to varied places of interest at the university. The aim is for participants to work together and unlock clues, undertake challenges and solve puzzles. The activities are designed to use teamwork and creative thinking skills in a fun and collaborative way, while also orienting students to the university. An activity example directs the student to find a QR code near the statue of Charles La Trobe standing on his head. When players arrive they are asked a question through the App which relates to the statue. They are asked to photograph themselves with the statue with extra points for standing on your head.

Development

Why develop an iPad App? In 2010, the iPad's first year of release, Apple enjoyed a market share of 90 per cent in Australia. This has since declined to a not insignificant 75 per cent market share.[4]

To strengthen the student engagement theme Faculty of Humanities and Social Science initiated a cross-faculty App development collaboration with the Faculty of Science Technology and Engineering’s Computer Software staff. Student teams were formed to develop three prototypes as part of a 3rd year Computer Science subject. The winning project was externally mentored with an iOS Developer to polish and test the App to get it ready for the 2012 “O” week trial. As the product was a real world project intended for download from the iTunes App Store the student developers took their roles very seriously and produced a high quality user tested product.

Associate Professor Dr Kay Souter said of the project *‘This has been an impressive collective involvement and it has been rewarding to see the project go from an idea to a realisation. The students who developed the app have gained practical skills and the app will be a useful tool to help incoming students get acquainted with their new learning environment while socialising with fellow students,’*

---

[4] (Retrieved October 17 2012 http://www.theage.com.au/digital-life/tablets/why-apple-is-making-an-ipad-mini-20121017-27r4z.html#ixzz29h2d0dDC)

Evaluation

Bateman (2010) states “When this research project began in 2006, neither the iPhone or low cost 3G netbooks existed, the iTunes Store was unavailable in New Zealand, wireless connectivity speeds were limited to first generation 3G (UMTS or CDMA) with limited coverage available, and Wi-Fi was limited to 54 Mb/s...” As the technology evolves so must the methods of evaluating mobile technology.

Mobile learning poses complex challenges when it comes to evaluating the student learning experience. Two issues arise: The experience of the learner occurs at different points in time and at different places. Secondly, the nature of mobile learning ensures the student is moving. This poses the challenge of capturing data for evaluation from a moving student at different times and places.

There are three areas to focus on regarding evaluation. They are usability of the application, effectiveness of the user experience and user satisfaction. Usability testing in a laboratory such as heuristic evaluation (Nielsen, 1994) is well established. Satisfaction levels may be established through surveys such as a Likert scale or by conducting interviews with students. Effectiveness of mobile learning is relative to the context and educational aims of the program being evaluated (Sharples, 2009).

Further to this, any form of evaluation undertaken by a user after a learning experience has occurred, needs to be executed in an innocuous way to reduce the possibility of evaluation interfering with the user experience. Ideally the evaluation occurs within the application and the experience is not dissimilar from the other elements contained in the game.

Within the limited timeframe of the project an evaluation, which fits the above criteria proved difficult to implement within the timeframe. However an opt-in online survey was incorporated into the App so when the game was finished players could, provide feedback. Only a very low percentage of participants opted in to complete the survey. This provided valuable feedback for us in the development of an evaluation strategy for Puzzlehunt Version 2 which includes more innocuous response feedback in a fun interactive way.

Every players experience is different from that of all other participants, therefore to establish a clearer and more accurate feedback, a mechanism to establish a contextual link between the user interactions and the learning experience needs to occur. This objective would be to provide relational data for better analysis of that data and a more accurate evaluation of the user experience against the learning outcomes associated with that experience.

Summary

There are significant learning opportunities which rise from the advances provided within mobile technologies. Puzzlehunt is an example of an iOS App, developed with an intended learning experience to playfully orient new students during “O” week to the university. The student designed and developed project is an example of a highly engaged student learning experience.

Taking stock of institutional e-learning usage: how is the LMS being used to support blended learning?

Kathie Goldsworthy
Teaching Development Unit
University of Western Sydney

Gina Saliba
Teaching Development Unit
University of Western Sydney

Lynnae Rankine
Teaching Development Unit
University of Western Sydney

For the last decade, institutions across Australia have heavily invested in learning management systems (LMS) to support learning and teaching activities. UWS, like other institutions have implemented a LMS and embedded support structures around it to ensure effective use by staff and students. Using a UWS developed framework to understand usage of the LMS, periodic analysis is done to determine the level, uptake and quality of LMS usage. At UWS, there is a major institutional focus on blended learning within all schools and a new blended learning professional development model being developed to equip and support teaching staff in effectively using the e-learning system for learning and teaching activities. Taking stock of the LMS usage is useful to identify strengths and gaps in usage and incorporate these into blended learning plans at the University.

Keywords: e-learning, LMS, ICT, professional development

Introduction

The University of Western Sydney (UWS) has a strategic focus on blended learning (UWS Teaching & Learning Plan, 2012-2014). In alignment with this Plan, all schools have developed three-year Blended Learning Plans to redesign their programs to include effective use of the LMS and ICTs in blended learning activities alongside face-to-face on-campus teaching. To inspire and equip teaching staff with the knowledge and skills in blended learning, a targeted support structure is also needed for teaching teams and academic staff. To facilitate this, a new blended learning professional development model is being developed. In forming this model, this LMS analysis project was done as a stocktake to determine the gaps in ICT usage and establish a base-line for measuring growth following the major institutional focus on blended learning to 2014.

In 2008 a benchmarking activity was conducted between Griffith University and UWS (Rankine et al, 2009) using a benchmarking framework to determine the level and quality of the uptake of the e-learning system. For this current project, the framework was reviewed and revamped to include not only the LMS functionality available but also the use of other learning technologies drawn from a literature review. Examples of other learning technologies included the use of marking rubrics to gauge students' performance of understanding (Heinrich, 2009), the use of such social media as Facebook and Twitter (Cochrane, 2010; Bart 2011; Oblinger 2010), cloud technologies such as Google Apps and You Tube (Britto, 2012: Williams, 2012; Johnson et al, 2012; Cochrane, 2010) and access to free open education resources (Atkins, 2007; Goldberg & LaMagna, 2011; Mulder 2011).

Research methodology

To undertake this project a number of activities were conducted:

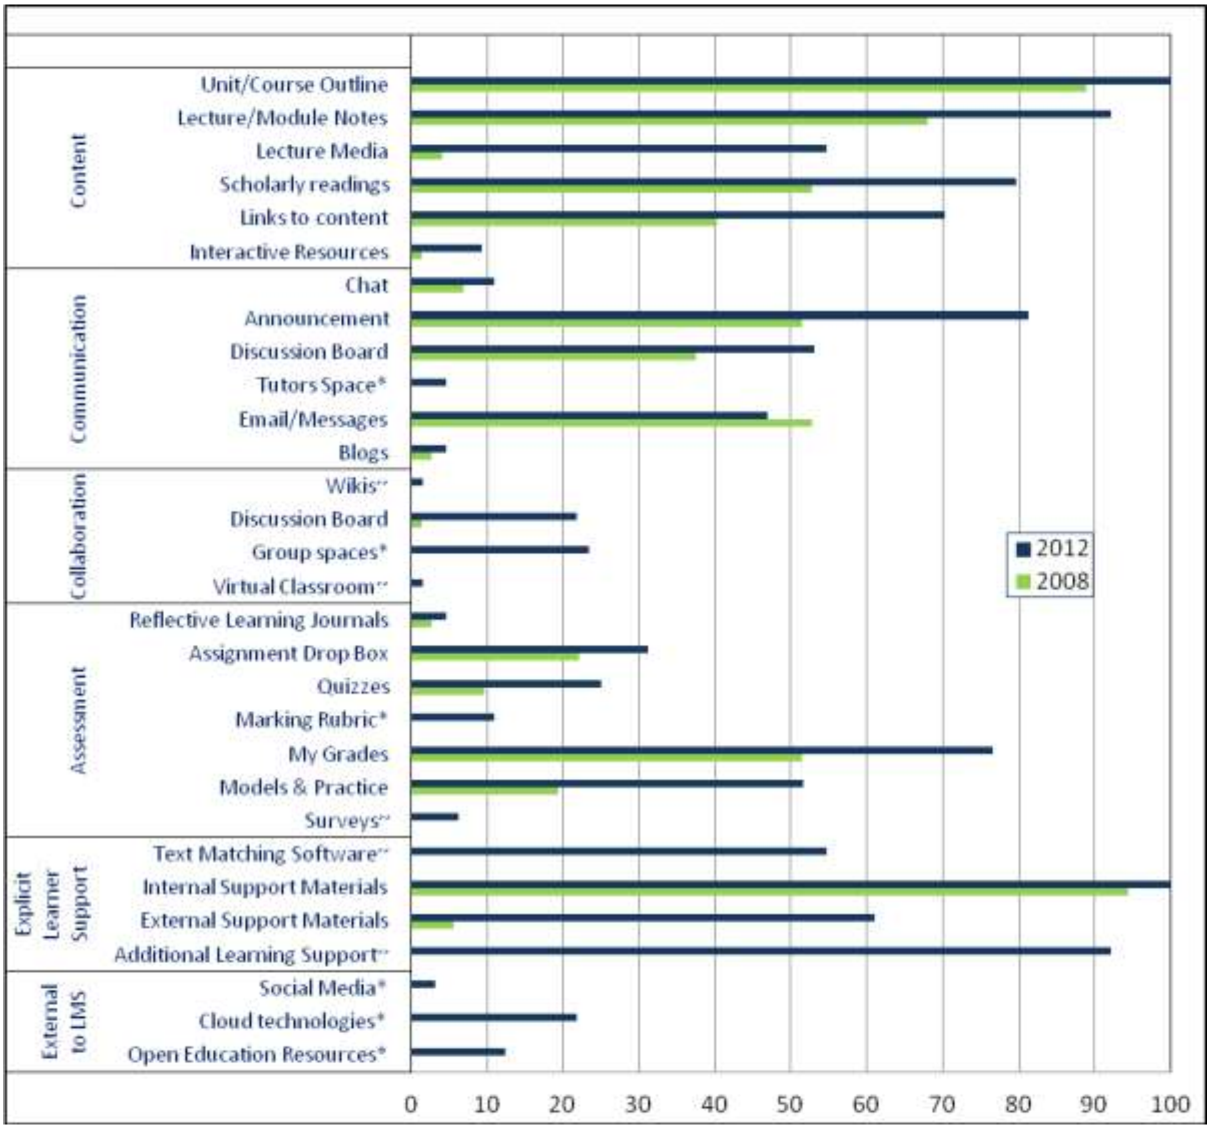
1. Review of the 2008 benchmarking framework for relevance: The framework used in 2008 was refurbished for currency in 2012 taking into consideration additional LMS functionality and other learning technologies.
2. Use the framework to review a 10% random sample of unit sites from Semester 1, 2012 in a similar manner to how it was applied in 2008. The sample was generated by determining all unit sites actively used by

academic staff during Semester 1, 2012. The sample included 10% of school sites with the mix of undergraduate and postgraduate units were maintained. This review of 10% of Semester 1, 2012 e-learning sites took the project team 40 hours.
3. Compare the results of the Semester 1, 2012 review with those from Semester 2, 2008 to understand usage of the LMS

Findings

The new framework provided a picture of the current status of e-learning usage at UWS and when compared with 2008 showed that there has been significant increase in usage since 2008 in all areas but the use of email/messages.

Table 2: LMS and external technology usage results 2012 and 2008



* New learning technologies added to 2012 framework to ensure currency of the framework elements.
~ Results from 2008 were zero for these elements.

Conclusion

The results confirmed increase in e-learning usage since 2008 with significant increases across the large majority of content, communication, collaboration, assessment and explicit learner supports. The results of the review found a number of gaps for inclusion in the new professional development model in the areas of: asynchronous and synchronous communication strategies; strategies to develop learning communities;

management of groups through online group spaces and tools; showcasing learning designs around e-assessment; and strategies to support students in large classes.

Although the 2008 evaluation did not analyse the use of external technologies and purely focused on the LMS tools and functionality, this 2012 review did find that social media is in use, along with freely available cloud technologies and open education resources and therefore this data will be useful for measuring the status of ICT enabled learning conducted in the future.

This paper reports on findings from a nationally funded project which aims to design and implement a quality management framework for online learning environments (OLEs). Evaluation is a key component of any quality management system and it is this aspect of the framework that is the focus of this paper. In developing the framework initial focus groups were conducted at the five participating institutions. These revealed that, although regarded as important, there did not appear to be a shared understanding of the nature and purpose of evaluation. A second series of focus groups revealed there were multiple perspectives arising from those with a vested interest in online learning. These perspectives will be outlined. Overall, how evaluation was undertaken was highly variable within and across the five institutions reflecting where they were at in relation to the development of their OLE.

Keywords: online learning environments, evaluation, quality enhancement

Introduction

The paper is based on findings from a nationally funded Australian Learning and Teaching Council project being undertaken over 2011-2012. The project addresses the key question of how universities best conceive of and implement, through distributed leadership structures**,** a quality management framework for online learning environments. The project is drawing upon the combined expertise and strengths of five universities using different learning management systems and at different stages of deploying their next generation online learning environment. One of the key aims of the project is to design and implement a quality management framework for online learning environments (OLEs). Evaluation is a key component of any quality management system and it is this aspect of the quality management framework that is the focus of this paper. An overview of the project and the framework that is being developed will be given, followed by an exploration of current practices and issues encountered when evaluating OLEs.

The framework

Two important domains were considered fundamental to the development of the framework namely: the nature and value of distributed/shared leadership in educational settings; and the quality management of teaching and learning in higher education in technology rich environments (Holt, Palmer & Dracup, 2011). Distributed leadership recognises that no single individual possesses the capacity to effectively undertake all possible leadership roles within an organisational setting (Conger & Pearce, 2003). This is particularly applicable to the development and management of online learning environments because to be effective, inputs and expertise from all parties contributing to the educational endeavour are necessary. Distributed leadership captures the scope and depth of involvement through its recognition of both vertical and lateral dimensions of leadership practice. It encompasses both the formal and informal forms of leadership within its framing, analysis and interpretation. Moreover, it is primarily concerned with the co-performance of leadership and the reciprocal interdependencies that shape that leadership practice (Harris, 2009).

Online learning environments can be conceived of as an ecology made up of many interrelated elements, each influencing the other (Ellis & Goodyear, 2010). Building distributed leadership capacity across the various elements was deemed central to the framework with the mechanism for achieving this being the cultivation of individual and collective agency amongst formal and informal leaders who are interacting in and across hierarchies (Holt et al., 2011).

A general message that comes from the literature on quality is that many areas of an organisation have an influence on enhancing the quality of learning and teaching outcomes and experiences, and that effective management of quality requires a comprehensive approach inclusive of the various elements and contributors, their interests and roles (Holt et al., 2011; Fullan &Scott, 2009).

Within this framing, the first phase of the project entailed a review of current approaches to the development and management of OLEs to identify the key elements and contributors for inclusion in the framework. Six key elements emerged - governance, planning, resourcing, organisational support, technologies and evaluation (Holt et al., 2011). Of these, evaluation can be considered to be the cohesive component that combines all the elements in the quest for quality enhancement. It provides the evidence to inform planning processes, alignment of resources with institutional priorities, the work of governing bodies in monitoring performance and outcomes, the choice and subsequent performance of technologies and the effectiveness of organisational support structures in meeting the needs of staff and students. More broadly evaluation plays a pivotal role in managing the risks associated with the online learning environments and ascertaining impact across the institution.

The second phase of the project involved a series of focus groups to explore each of the six elements and their interrelationships in more detail. The first series focussed on the higher level institutional concerns associated with visioning, strategising, planning, managing and evaluating OLEs. Arising from discussions about the importance of evaluation and its effectiveness was universal recognition of its centrality to quality management. Leadership at all levels was seen as fundamental to the development of a coherent approach to evaluation, particularly in regard to articulating and communicating a strategy, engaging staff at all levels, and providing adequate funding. The importance placed on evaluation, combined with the impression that there was not a strong shared understanding amongst participants of what it entailed, highlighted the need for further exploration.

A second series of focus groups, conducted in 2011, explored the notion of evaluation in more depth to gain insights into the nature, scope and effectiveness of current practice. The findings from this series are reported below.

Procedure

Five focus group discussions were held at each of the partner institutions. Participants were chosen by the respective project team members to represent a wide spectrum of seniority in order to capture the distributed leadership focus of the project. The total number of participants was very similar in the first and second series of focus groups (46 cf 47). Twenty eight came from central support offices and 18 from faculties which was similar to the first group (29 and 18 respectively).

Each focus group was of approximately 90 minutes duration. All were face-to-face with one having a single off-shore participant who was involved through video-conferencing. The issues canvassed were determined by the project team, with a single facilitator designing the activities and approach and then conducting the focus groups at each of the universities. Questions posed to the participants covered: the importance of evaluation for the success of OLEs; the effectiveness of current practice; who needs to be involved, what information needs to be collected and for what purpose; the effectiveness of dissemination strategies; and how the findings impact decision making for quality enhancement.

Oral and written data resulted from each focus group; discussions were recorded but not transcribed. The findings from each institution were returned for confirmation of accuracy. Individual reports were then synthesised to gain a richer understanding of issues and the differing interpretations that arose from the operating contexts at each institution. Some of the key issues arising from the synthesised report are presented in this paper. It is important to note however, that they do not represent a comprehensive account of all issues, nor do they represent a consensus of views. Rather, the intention is to highlight the range of different perspectives encountered.

Findings and perspectives

The fundamental importance of evaluation to the development, implementation and management of OLEs was established from the outset. When asked to rate the importance of evaluation (on a five point scale ranging from a very good extent to no extent) of the 46 participants, 43 rated it, to a good /very good extent, 2 to a reasonably moderate extent and 1 did not reply. In answer to the question of the effectiveness of the current evaluation of OLEs, eight rated this as reasonably effective, 18 as moderately effective and 6 as minimally effective.

The higher ratings on both these questions were more likely to come from those charged with responsibility for developing and implementing infrastructure – making decisions on technologies and tracking their uptake and performance. There was general agreement with the proposition that OLE evaluation is often conceived of as a technology project and hence the evaluations being undertaken tended to reflect this perspective. Nevertheless, there was a definite sense that pedagogical matters were increasingly considered as an element of any OLE evaluation which is evident in the following responses.

> ..it didn't take long for the University to realise that, if evaluation were construed as only about the technology; it was a waste of millions of dollars.
>
> People's eyes have been opened to the fact that it's about people, it's about learning and teaching and we're aware of that and we're moving towards supporting it at the moment.

What constitutes effective evaluation?

Emerging from the discussions was an understanding that effective evaluation is cyclical in nature with the focus being on continuous improvement. It is culturally embedded and systematic and while the timing may effect emphasis and focus, the nexus between infrastructure, the technologies and their implementation for learning and teaching is a constant. Moreover, OLE evaluation at the University level ought to be monitored with the process regularly reviewed and refined as necessary. This fuller understanding of what constitutes effective evaluation is encapsulated in the following comment:

> We are coming to grips with the system; we are beginning to understand the place of evaluation in a system that is new to us. That we understand that not having an evaluation strategy and not having a workable evaluation framework and the tools to do that is a big problem – that's progress.

The importance of being systematic and linking evaluation findings to key decisions about OLEs was reinforced by several groups who identified the need for a coherent approach within an overarching strategy and framework. This accords with the four levels of evaluation described by Kirkpatrick (1994) namely: reaction to the innovation; achievement of objectives; transfer of new skills to the job or task; and impact on the organisation. Taking this a stage further, Peat (2000) suggests the resources being developed and the process of co-creation can be evaluated in a number of ways: formative (are the artifacts, actions or policies functional in their context?); summative (are they influencing practice?); illuminative (what is their utility and are there any unexpected outcomes?); and, integrative (how are they best put to use in an organisation?)

What information needs to be collected and for what purpose?

Responses showed differences between the information sought by those from central support units and those for faculties. Faculties tended to be more concerned with the evaluation of online course materials and the quality of the learning experience. Central support units on the other hand were perceived to be more concerned with technical aspects of the OLE gained from server-logs for example, access and usage data. While it was recognised that routinely collected data of this type could provide valuable insights into teaching, learning and course design, there was also recognition that such data only provided a starting point and did not reveal the depth of detail necessary to provide a comprehensive understanding of the effectiveness of the online learning environment. In addition it was noted that the amount of data generated could be 'incredibly overwhelming' and it was doubtful whether staff took the time to analyse and act on it in a timely fashion, if at all.

Student feedback gained through standard course surveys was noted as another source of data. For some there was a sense of progress being made with the inclusion of explicit questions about the OLE. However for most, the extent to which issues related to OLEs were captured in student surveys was low. Even when captured there were doubts expressed about its usefulness. As one participant noted, "One question about a whole environment is just a beginning". Other concerns were expressed about low response rates and also the representativeness of the student cohort.

Some expressed the view that there was insufficient variety in the methods used to collect data. In addition, there was a sense that increased support in analysing data and presenting findings in a more palatable format with follow-up would lead to better outcomes. It was also suggested that faculty staff need to be convinced that evaluation is also their responsibility and their increased participation would lead to more meaningful engagement and hence to local improvements.

There appeared to be less concern about data collection than about its value and how it is being used. As one participant noted:

> Yes, the data comes in. Yes, some people look at it and some individuals might do something with it but [the University] as a whole hasn't made a decision that there are consequences to the data and consequences to it being at different levels. We haven't even decided what's satisfactory, what's acceptable, what's not acceptable and what's the trigger point and the automatic action that will follow. Which goes back to the point, don't ask the question if you're not actually going to do something with the results that come back from it.

It was agreed that 'closing the loop' and using data generated to inform decision making - as distinct from only collecting data – was an important part of an effective evaluation process. If these data were not being used to inform decision making and reports are shelved without their findings being shared with interested parties, the value of such evaluation is severely limited. The impression was that instances of 'closing of the loop' were much stronger in the actual selection of technologies than in their application for learning and teaching.

Dissemination

There was consensus that evaluation findings need to be appropriately disseminated so that decision making about OLEs can be evidenced-based. While instances were given where findings are reported and available electronically, there was less assurance regarding the extent to which the findings were accessed and used to inform practice. This was evident in responses to the question of how effective findings were disseminated so they could have a real impact on decision making. Of the 46 respondents only one felt that dissemination was achieved to a 'good extent', 12 felt it was reasonably effective, 15 moderately effective, 4 minimally effective, and 11 did not see evidence of dissemination.

Discussions revealed that although staff from central units stated "We've been doing a lot of work on the evaluation of the new system", faculty staff in particular, were often unaware of this activity as revealed by comments such as: "What is being evaluated?"; "No idea. I don't know who does it [evaluation] and what they do with it" claiming "They're not communicating with us". These comments suggest that a greater emphasis on communication, both lateral and vertical, within the institution is needed.

Nevertheless there were examples where dissemination was effective. One good practice cited was where committees and reference groups had been discussing student feedback on learning technologies with both central and faculty staff to increase their understanding of what was happening as various technologies were implemented, so shaping thinking and actions. Another instance was cited where central staff working with individuals and small groups disseminated information and findings that was useful for shaping improvements to learning and teaching.

Conclusion

Evaluating OLEs needs to be undertaken from multiple perspectives. Multiple perspectives though come from multiple parties with a variety of evaluation purposes in mind. It is not necessarily easy to clearly identify and constructively reconcile these differences for advancing the quality of OLEs as evidenced by this round of focus group discussions. Better aligning of various leadership roles across, up and down the organisation is a vehicle for drawing out different stakeholders' informational and decision- making needs. The focus group findings reaffirm evaluation as being seen by most as an imperative and at each institution examples were provided to evidence that both formal and informal evaluation were occurring. We concur with Fullan and Scott (2009) that much greater commitment to systematic institutional evidence gathering and use is required in the area of OLE implementations.

How evaluation was undertaken was highly variable within and across the five institutions reflecting where they were at in relation to the development of their OLE continuum. Those where choices of key elements are still being made, or have very recently been made, are likely to express different evaluation concerns and objectives from those who have had core elements in place for more extended periods. Evaluation demands will only intensify, along with need for distributed leadership structures, as we see the continued proliferation of social media/networking/cloud-based services growing up in and around organisations enabling more devolved, and less controllable, environments for socialisation and academic learning.

What's the Big Idea 2012? The Flipped Lecture

Elizabeth Greener
Manager learning Design, Member ascilite Executive
eLearning Services
Queensland University of Technology

Elizabeth Greener has worked as a manager in the field of promoting effective use of educational technologies in higher education for ten years; previously working as a secondary teacher and professional development manager in several parts of Australia and internationally. Currently managing the Learning Design group at QUT, her role has included establishing faculty based programs supporting the implementation of blended learning approaches, managing and delivering QUT Innovation Forums and piloting approaches for crowd sourcing ideas on innovation. She has also directed major flexible learning projects and programs for QUT and the ALTC. Her interests lie in teaching and learning, change management and educational leadership.

Roger Cook
Learning Designer**,** eLearning Services
Queensland University of Technology

Roger Cook has worked as an educator and educational designer for the past 21 years in Australia and internationally. He provides support to the Faculty of Science and Technology and is involved in institutional-wide initiatives such as the exploration and adoption of blended learning approaches in new physical learning spaces. His interests include authentic and student-centred learning, mobile and cloud computing, visual learning approaches and learning analytics. He is fortunate to work with a team of learning designers who possess a wide range of skills and interests and who can develop team-based solutions to teaching problems.

Christine Newman
Learning Designer, eLearning Services
Queensland University of Technology

Christine Newman is a Learning Designer at the Queensland University of Technology. She supports academic staff in the effective use of a wide variety of technologies to assist learning; her particular interests include virtual worlds, web conferencing, mobile and tablet devices, improved presentation techniques and methods of content delivery, and effective use of space for collaborative learning.

> New digital technology is enabling new models of teaching and learning. Will the currently trending "Flipped lecture" provide an approach that will impact positively on learning, or is it more "back to the future?' Simply, will flip flop?
>
> Or…
>
> I should like to know about risks, out-of-pocket expenses, time required and remuneration, and so forth" - by which he meant: What am I going to get out of it? and am I going to come back alive.
> - J.R.R. Tolkien, *The Hobbit*, Ch. 1

Outline of focus area and summary of ideas to be explored

The Flipped lecture (or classroom) is an emerging description of a pedagogical model where the typical lecture activities and the work students traditionally do at home or out of class are reversed. For an overview - http://www.youtube.com/watch?v=26pxh_qMppE&feature=youtu.be
Students view prerecorded lectures (or listen to podcasts) and complete interactive activities in advance of class. Then when in class they engage in collaborative activities, enquiry based learning or test their skills in applying knowledge. (Educause, 7 Things you should know about Flipped Classrooms 2011). The Flip models are as numerous as the variations on the name, and span the school sector and now increasingly the tertiary education sector. Requiring careful planning and considered use of educational technologies the approach can lead to greater engagement, student centred learning and increased understanding. However there are pitfuls; including student resistance and time and technology demands. With the rise of open educational resources the concept of lecture repositories is now commonplace, with sites such as http://ed.ted.com/ including "Flips" and educational design for use in a variety of educational settings. The convergence of Open Education Resources (OER),

lecture capture technologies and mobile learning place the Flip pedagogy at the forefront of approaches for new ways of learning. Through exploration of examples, case studies and participant experiences, this symposium will seek to explore the participants' views on the approach and relate this to the conference themes. Is the approach contributing to learning for the future and importantly, is it sustainable?

Range of views that panel members will represent

The panel members are engaged in a variety of roles; facilitating and evaluating innovation, supporting academics in adopting new approaches and developing strategies to foster change, academic capacity and sustainability. The focus will be on audience discussion, and the panel will act largely as facilitators.

Describe the intended audience

Any conference attendees interested in contributing ideas and challenging their thinking and those tasked with creating, delivering and managing change in learning and teaching in new spaces and utilising new educational technologies.

Outline of the symposium format, including strategies that will be used to engage the audience

This session aims to be interactive and audience led. Audience members will be able to engage in brainstorming and polling activities via their mobile devices; using GoSoapBox, (http://www.els.qut.edu.au/innovation/emerging/gosoapbox/index.jsp) a web-based student response system which blends the physical space with a virtual learning environment. The format will be lively, provocative and engaging. The flipped lecture concept will be introduced with a multimedia overview that will also capture student and academic opinions about its use in learning and teaching. It will also show examples of the approach in practice. The Chair will then seek those with flip experience from the audience to explain, in small groups, their practice. The panel will present assumptions and misconceptions as a provocation and the Chair will lead a plenary discussion and polling exercise to consider the audience perception of the question that the Flip concept will positively impact on learning for the future. This session ideally would be programmed toward the end of the day's sessions, when topics introduced in earlier sessions can be discussed under the banner of this forum. The chair and panel facilitators will strive to create a flipped experience by demonstrating an effective format and use of technology that engages the audience and stimulates thinking and discussion.

Sustaining the future through virtual worlds

Virtual worlds (VWs) continue to be used extensively in Australia and New Zealand higher education institutions although the tendency towards making unrealistic claims of efficacy and popularity appears to be over. Some educators at higher education institutions continue to use VWs in the same way as they have done in the past; others are exploring a range of different VWs or using them in new ways; whilst some are opting out altogether. This paper presents an overview of how 46 educators from some 26 institutions see VWs as an opportunity to sustain higher education. The positives and negatives of using VWs are discussed.

Keywords: virtual worlds, Virtual Worlds Working Group, VWWG, Second Life, SL, OpenSim

Introduction and background

As we race through the 21st century, the demand to make education globally accessible and always available is increasing exponentially. This demand for increased accessibility exacerbates the deficiencies already experienced in higher education with educational resources being stretched by increasing numbers of students, fewer staff and less support. Given traditional delivery models, under these circumstances the provision of quality education is unsustainable (Gregory & Gregory, 2011). The pressures on staff are enormous and the workplaces that our graduates are likely to enter are becoming more complex with increasing reliance on advanced technologies and associated processes. Finding new ways for students to engage with and link to a learning community is crucial. As the fidelity of 3D virtual worlds (VWs) increases and more students opt to learn online, VWs are increasingly providing rich experiences for learners as places where students and staff can interact with each other and the wider community (Brenner, 2009). The social immersion engendered by a sense of community provides the potential to reduce dropout rates so that more students will persevere with their studies (Karsenti & Collin, 2012). Access to learning that may be too costly or too dangerous in the physical world can be made possible through VWs (Thackray, Good and Howland, 2010; Savin-Baden, 2011). VWs enable activities that make life and learning meaningful, such as getting together, sharing information, collaborating and celebrating (Gregory & Tynan, 2009). Herewith, members of the Australian and New Zealand (NZ) Virtual Worlds Working Group (VWWG) demonstrate how VWs can be used to sustain the future of education.

In 2010, 21 members of the VWWG outlined ways in which they were transforming the future through VWs (see Gregory et al., 2010) and by 2011 69 members reflected on how Australian and NZ higher education institutions are sustaining the future through the use of VWs (see Gregory et al., 2011, and Hearns et al., 2011). There have been dramatic changes in the ways in which institutions are using VWs and these changes are reflected in the brief overview of the use of VWs in teaching and learning by the 26 institutions represented in this paper. The focus of their combined comments is sustainability and learning for the future.

Virtual worlds and sustainability

VWs are 3D online environments populated by multiple users through their avatars (Girvan & Savage, 2010). Across the world, many universities have a VW presence (Thackray, Good & Howland, 2010). The ability to be "immersed in a synthetic, constructivist environment" as suggested by Dede (1995, p. 46) is a major factor in educators persevering with VWs to provide complex learning experiences that promote higher order cognitive skills in their students. The popularity of VWs in higher education remains undiminished in defiance of a range of barriers including technical, identity-based, cultural, collaborative, economic and creative issues (Warburton, 2009) and accessibility (Wood & Willems, 2012). Although these barriers remain today, educators' perseverance, as demonstrated in this paper and in the literature (Savin-Baden, 2011), reveals their belief that VWs can deliver positive student outcomes. Although we propose that VWs have the potential to address issues of sustainability in higher education, there is currently scant reference in the literature. As Dede (2005, p. 226) reminds us, "The evolution of higher education is shaped by changes in the characteristics of entering students, by development of new methods of teaching and learning, and by shifts in the knowledge that society values". We believe that VWs have a part to play in this evolution, as suggested by Ondrejka (2008, p. 229), who states that the "mix of fantastic possibilities and social educational opportunities has VWs poised to transform basic approaches to learning and communication, as well as innovation and entrepreneurship."

Method

A survey was circulated to VWWG members seeking their thoughts and opinions on how trends in VWs were affecting their institution. They were also asked what "sustaining the future through VWs", meant to them and their institution. Forty-six authors from 26 institutions participated, consisting of experts, champions or regular users of VWs with in-depth knowledge of the challenges facing the longer term viability of VWs in education.

Analysis and discussion

The following information is a collation of the survey data. VWWG members indicated that they use VWs across a wide range of disciplines for a myriad of purposes including education, early childhood learning, physiotherapy, pharmacy, social work, occupational therapy, health, nursing, community service, aged care, nutrition, sports and soft tissue therapies, OH&S, arts, medicine, biotechnology, criminology, languages, ICT, multimedia, business, law, project management, journalism, construction, communications, employability skills development and research. Educators reported on a diverse range of activities including games, interviews, lectures, literacy activities, discussions, reflections, simulations, building, scripting and role-playing. Educators work with school students, collaborate with other universities, conduct careers days, conferences, workshops, public relations activities and create machinima (in-world video) as a teaching resource. Table 1 provides a summary of the findings indicating how 26 institutions are using VWs in teaching, learning and research.

Table 1: Institutional opt in year, discipline(s) and how virtual worlds are being used

Year	***Institution,*** *Discipline(s)***,** How the virtual world is being used
1997	***Charles Sturt University***, *social work, policing and chemistry, information studies* - social networking and preservation, online conferencing, student presentations, group discussions, meetings, socialising.
1998	***University of Western Sydney***, *digital humanities, cultural studies, health care, computing, engineering, mathematics* - research, human-machine interaction, games, simulation, social informatics, cyber-physical systems.
2005	***University of Southern Queensland***, *counselling, public relations, language, law, education* - meetings, conversation, courtroom trials, attentional restoration, trial bots, the Encke Virtual University Collaboration.
2006	***Victoria University***, *White Card certification, biotechnology* - construction training game, simulations
2006	***Nelson Marlborough Institute of Technology***, *midwifery, interviewing, IT, English as a Second* Language - build, script, events, machinima, staff workshops.
2007	***University of New England***, *education, pharmacy* - tours, role-plays, guests, experimentation, discussions, reflection, web quests, machinima
2007	***Queensland University of Technology***, *law, business, nursing* - community plaza and auditorium, machinima, field trips, games, AI, simulations, learning design.
2007	***University of South Australia***, *career services* - communication, teamwork, problem solving, interviews, meetings.
2007	***Monash University***, *languages, behavioral studies, pharmacy* - simulations, bots, identity, privacy, communication, teamwork, commerce and community, problem based learning.
2008	***Deakin University***, *crime, arts education, medical discipline, health sciences* - tutorials, scenario based learning, Physical TV Company production "Thursdays Fictions", case studies, scenarios.
2008	***The University of Queensland***, *languages, educational technology, pharmacy, assessment* - orientation, field trips
2008	***Curtin University of Technology***, *physical and multi-disciplinary, health sciences and information systems* - oil, gas and mining industry, modelling, 3D graphics, social interaction, collaboration, learning, simulations.
2008	***University of Technology Sydney***, *retail, administration, international studies* - language teaching, course design, delivery modes, learning strategies.
2008	***Canberra Institute of Technology*** and ***University of Canberra***, *health* - communication, inter-disciplinary learning, skill development.
2008	***University of Newcastle***, *architecture* - design learning, collaboration, creative possibilities.
2009	***Manukau Institute of Technology***, *interviewing, language studies, nursing, policing, teaching* - holodeck (scene changer), discussions, interview and media room, advertisements, literacy enhancement, presentations.
2009	***University of Ballarat***, *Emergency room, stuttering support, art, variety of subject areas* - simulations
2009	***University of Western Australia***, *art, teaching, visualisation research, architecture marketing, business, teaching and learnin*g - amphitheatre for large numbers, machinima.
2009	***Southern Cross University***, *commerce, management, law, justice, hospitality, tourism, education* - role-play, maths, science, sustainability.
2009	***Victoria University of Wellington, NZ***, *language* - oral presentations, research, meetings, speakers, developers, PD, contacts, learning, field trips, interviews with native speakers
2010	***Macquarie University***, *education* – learning, teaching, site visits, geometric problem, accessibility, interaction.
2010	***Flinders University***, *mental health* - machinima, otherwise have discontinued using VWs.
2010	***University of Tasmania***, *designing virtual worlds, sociology, social work, education* - creation of stand-alone structures, themed 3D environments, view lectures, role-play, chat, machinima.
2012	***Canberra Institute of Technology, University of Canberra with Oztron***, *OH&S, health* - create spaces for higher education institutions including skill development e.g. IV medication scenario
2012	***James Cook University,*** *public health, Information Technology - posters, bots* - screen casting to share computer screen, interaction.

Sustainability in virtual worlds – an Australian and New Zealand perspective

VWs offer engaging learning opportunities for students, particularly those at institutions that have a strong focus on distance learning. VWs can help to meet the need for more flexible learning through practical procedural based activities that can be delivered online and at a distance and can be accessed remotely from anywhere at any time. Traditional expensive physical settings are under pressure from both increasing student demand for flexibility and restraints on resources. VWs provide a proving ground for prototyping new methods of learning and teaching, especially constructivist, problem-based approaches. They also offer a way of meeting current demands for widening participation as we look for more flexible ways to accommodate an increasingly diverse audience.

In preparing students for a knowledge-based society, educators need to shift their focus to enquiry-based education, facilitating the development of creative problem solving skills and increasing opportunities for students to undertake practice-based and service learning. Without the use of technologies such as VWs, educators are limiting options for expanding their range of educational activities and resultant positive outcomes for students. VWs enable student work to be showcased nationally and internationally, providing them with an expanded network of opportunities. Educators can connect globally in ways that remove barriers to the creation of networks and communities. The following outlines a number of themes in relation to the sustainability of higher education provision via the use of VWs that emerged from the analysis of survey responses.

Innovative teaching methods

VWs can facilitate an expansive range of innovative teaching and learning methods (see Table 1), which include simulations, role-plays, virtual tours, building, scripting, and the inclusion of geographically distant experts within courses. All these methods can utilise VWs to teach and learn in ways that are not possible or viable by traditional face-to-face teaching or distance learning using Learning Management Systems. VWs allows for the synchronous provision of the same experiences for students irrespective of study mode or location.

Multimedia production

VWs enable the development of engaging and challenging learning materials including 3D models, data visualisation and machinima, contextualising otherwise abstract principles and making difficult areas of curriculum accessible. Such materials suit modern day learners who are surrounded by ubiquitous information and merged technology and who deal with competing time commitments. Machinima is also cost-effective as it is cheaper to make than traditional video productions. It is also flexible, since specific content can be created far more easily than in real world environments, and accessible, since professional cinematic expertise is not required.

Blended learning

VW technology offers a bridge to future educational environments where the real and the virtual can coexist seamlessly and where on-campus and distance education cohorts can be bought together. VWs provide a place to learn, engage, experience and experiment and are fundamentally about experiencing global connection in a 3D environment in real time. This can include working in virtual teams or attending conferences, but their real value is in allowing educators to grasp some of the issues and challenges that they will face in the new real/virtual integrated world, and to giving them opportunities to experiment with how they, as individuals as well as educators and students, might start to approach these challenges.

Economic constraints

It is inevitable that there will be more economic constraints on higher education institutions in the future and while it can be argued that VW technology is expensive to establish, the continuing costs are minimal in comparison. The costs of establishing virtual facilities are many times less than building similarly innovative physical spaces on-campus. VW simulations, particularly of complex, dangerous or rarely encountered situations are also cost-effective when compared to running simulated events on campus. Experiments can be conducted cost-effectively without harm to others and at minimal costs compared to real life experiments. The costs and time associated with transport and accommodation related to conferences, field trips and off-campus students attending residential schools could be minimised or eliminated. Virtual excursions can provide authentic learning; virtual conferences allow distant colleagues to gather easily, and off-campus students can come together for a virtual residential school that can offer many of the affordances of face-to-face sessions. Unfortunately, academics are sometimes not aware of existing virtual spaces and may embark on large projects costing substantial amounts of money. With a little planning and savvy, VWs can enable the cost-effective provision of a range of services and student learning, particularly if the free resources that have already been created in VWs are utilised. However, VWs have not always been adopted at an institutional level. Rather, projects have been implemented and driven at an individual, unit, program or faculty level, therefore there is greater need for coordination, particularly within institutions, to realise improved cost savings.

Careers

There is an increasing trend for employers to use VWs as part of their recruitment practice and service delivery (Andersohn, 2009; Klingshrin, 2010; Sullivan 2010), as evidenced by the appearance of virtual careers fairs. The more learning institutions utilise and thereby expose students to this environment, the better graduates will be positioned for the work world of tomorrow.

Collaboration

VWs make the increasing focus on national and international educational collaboration easier to accomplish, with the ability to bring geographically distributed staff and students together in one virtual space. For example, VWWG meetings are unique in the Australasian context, allowing a diverse group of academic staff from many universities to meet regularly. These meetings have enabled the VWWG to retain its membership and activities over three years. The VWWG began in November 2009 with ten members from four institutions. The current membership is now over 190. The first meeting began by teleconferencing. Skype was then used. By the third meeting, the VWWG decided to only meet in the VW with communication via in-world audio and/or chat. The ability to create and store resources on an extremely limited budget will be of benefit to all providers particularly as the body of knowledge in all disciplines continues to grow in leaps and bounds. Given the need to make sense of this explosion in the availability of information, we need to educate new students in how to learn and how to work together in a community of practice so that ideas can be shared and knowledge built collaboratively. It has been demonstrated that VWs are a suitable environment for the development of these communities and the sharing of knowledge and resources (Molka-Danielsen, Mundy, Hadjistassou, & Stefanelli, 2012).

Professional Development (PD)
If we consider the sustained use of VWs in Australian and NZ education, it is necessary to reflect on the PD of current and future educators if adoption beyond special projects is to take place. The IT and pedagogical support units in institutions will need to gear up to support academic's use of VWs. This could be achieved by the creation of ready-made environments, shareable examples and the offering of PD courses, which will help stimulate interest and develop a critical mass of knowledge about VWs in the academic community. Teacher education programs would need to familiarise pre-service teachers with VWs by providing them with opportunities that will challenge their ideas on pedagogy.

Future of learning using virtual worlds (sustainability)

In the pursuit of better educational outcomes, many members of the VWWG in Australia and NZ, believe that the future will see VWs playing a greater role in teaching and learning. Those proposing an increase in VW use see the development of more user-friendly input devices, browser based access and an increase in bandwidth reducing any impediments and encouraging the creation of configurable worlds that that were not previously possible. In some universities, VWs, 3D virtual environments and simulations are now embedded in a number of formal curricula and, while still not widely used throughout all disciplinary areas of the university, they are driven by individuals rather than at an institutional level. The need to demonstrate levels of innovation in both teaching practice and teaching spaces has helped to sustain the presence of VWs in many universities. Examples such as language learning offer new possibilities in speaking, writing and listening through the development of innovative visual and interactive learning activities.

An important issue that demonstrates the sustainability of VWs is the emergent use of different VW platforms. In 2010, when the first VWWGs paper was published, approximately 90% of institutions were using Second Life (SL). Now two years later, many are using OpenSim and other platforms, even though the majority has retained a SL presence. As staff become more sophisticated in their skills in building and scripting, the opportunity to develop closed VWs where students can self explore scenarios as many times as they like is increasing the possible uses for academics. One reason for the movement away from SL is the growing movement towards more manageable simulation environments and intranet versions of VW servers for easy development of internal secure grids and mobile VW clients. This will facilitate ad hoc and ubiquitous usages of VWs in educational scenarios to contribute to a greater uptake of VWs. Some of the barriers to using VWs continue to be the usability due to bandwidth and hardware quality, but these are generally felt to be less of an issue than in previous years and likely to be resolved with future developments in networks such as the Australian National Broadband Network (NBN). To increase the use of VWs, especially SL, the costs and time needed to develop skills is still mentioned as a barrier. A general sense of optimism in the uptake in VWs is expressed through the survey responses.

Two VWWG members who are not as optimistic about the future growth of VWs reported that they cannot accommodate the time requirements of working in VWs where more teaching responsibilities are falling to sessional staff, some of whom may not be familiar with many current pedagogical initiatives including the utilisation of VWs. A growing emphasis on educational technologies such as social media and mobile computing technology such as smartphones and tablets appear to be currently receiving a greater focus than that of VWs. Even though these devices limit the possibilities of using VW viewers, they do amplify the possibilities of augmented reality and we are beginning to see projects that tap into these affordances. What seems to be evident is a reapplication of the basic principles of immersion and engagement and repurposing them into other contexts that are more sustainable under prevailing conditions within the university. The more sophisticated VWs will see future application in those areas where their affordances more closely meet pedagogical requirements than do other, less demanding, competing technologies.

The findings reported in this paper represent a limited number of academics from a self-selecting group of virtual world advocates (members of the VWWG), and so care must be taken to avoid generalising the implications beyond this population. Furthermore, limitations on space do not provide scope for a more detailed critical analysis of the data. Despite these limitations, the snap shot of the use of VWs by members of the VWWG suggest a few interesting trends and the implications for the long-term sustainability of these environments for teaching and learning in higher education.

While VWs are gradually becoming a feature of tertiary education, key influencing factors for sustainability include: ongoing improvement in the network and computer technology needed to access and develop these environments; greater functionality of VW platforms combined with a commensurate improvement in user-friendliness and accessibility features; ongoing empirically based research into models of learning that incorporate VWs leading to improved pedagogical design of learning activities and demonstrated relevance of these activities to the main curricula; changes in broadly held perceptions of VWs from being associated with leisure-based gaming activities to that of useful tools which can provide learning opportunities not readily available in real world settings; an increase in PD of educators towards improving technical skills and literacy of educators as to the affordances of VWs; and a general increase in online interaction in all aspects of everyday life.

Further research should extend studies such as this to a wider, more representative population, including academics that are not currently using VWs in higher education to begin to build a more comprehensive picture of the future sustainability of these environments. Such a study should be conducted longitudinally to track changes in technology, pedagogical approaches as well as changing teacher and student attitudes toward the use of VWs in the curriculum.

Acknowledgements

The authors would like to acknowledge members of the Australia and New Zealand Virtual Worlds Working Group (VWWG) who have made it possible for this collaboration to take place.

Meeting the Challenges of Sustainable Learning Support

Michael Griffith
Associate Professor, Faculty of Arts and Sciences
Australian Catholic University

Michael has been using blogging technology since 2005 to enhance his teaching of literature. He has a PhD (Sydney 1981) in Australian Poetry and a Certificate of Higher Education from ACU (2011). His research topic for the Cert. in Higher Ed was "Blogging in the University Literature Classroom: A Case Study". Michael has given academic papers on the use of technology in Higher Education at Blackboard Conferences in Chicago and Cairns. He has published widely in the field of Australian Literature and Spirituality and has recently begun publishing in the area of teaching with technology.

Diana Simmons
Academic Skills Unit
Australian Catholic University

Diana Simmons gained a Masters Degree in Applied Linguistics in 1991 from Macquarie University, majoring in systemic functional linguistics and literacy development. She has lectured in both these areas at Macquarie University, the University of Technology, Sydney, the University of Western Sydney and the University of Wollongong. Since 1999, on joining the Academic Skills Unit at Australian Catholic University, her work has focused primarily on tertiary literacy. The affordances offered by recent advances in technology are of particular interest to her, as they allow for literacy development through peer-to-peer as well as teacher-to-student interaction.

Simon Smith
BCompSc, GradCertHum, MBA
eLearning Team
University of Adelaide

Simon is currently employed as an eLearning Designer at The University of Adelaide. In addition to his current role Simon has worked in the tertiary education sector in South Australia, New South Wales, and Jiangsu Province China in the roles of Online Applications Specialist, Systems Administrator, and Lecturer. Simon's research interests include intercultural issues in education, large class and diversity issues, and electronic assessment within the tertiary education environment. Simon has a particular interest in semi-automated quality feedback and the design of media to increase perceived quality of feedback content.

Paula Williams
Faculty of Health Science
Australian Catholic University

Wai-Leng Wong
Systems Infrastructure
Australian Catholic University

BSoc Sc, Grad Cert Computing, Master in Learning Science and Technology
Wai-Leng has been collaborating with Michael in the use of technology for engaging students since 2004. She has worked in a wide range of roles including five years in the elearning area: provided support to lecturers in the use of LMS (for face-to-face and online units) and use of Web 2.0 tools, research support and copyright. Her interests are in learning design, pattern language and the use computer-supported collaborative learning.

Outline of focus area and summary of ideas to be explored

Universities and staff are under pressure to demonstrate improved performance and often with declining resourcing (Ellis & Goodyear, 2010). Currently the authors are involved in the design of a pilot "study" that will comprise students from two different faculties to use blogging technology as a way of enhancing their writing skills and their engagement with learning. Blogging was the technology of choice as there has been positive anecdotal feedback from students in a literature course. While the feedback has been positive, there have been a number of challenges with managing blogging and managing students' expectations in relation to timely feedback. This project will also explore the role of peers in the community of bloggers, use of semi-automated quality feedback and informal support provided by academics and academic skills advisers. This cross-faculty model involves voluntary participation of students from a literature cohort and students from a health science cohort.

Range of views that panel members will represent

- Michael - using blogging - literary/creative aspects; assessment
- Diana - academic skills perspective; leverage blogging to improve students writing in particular academic writing
- Simon - semi-automated quality feedback with blogs - design, etc
- Paula – expertise in elearning and perspectives from a faculty that support large class sizes
- Wai-Leng computer-supported collaborative learning to support and enhance learning using Web 2.0 tools and technologies

Describe the intended audience

Staff in higher education institutions, colleges and schools looking at use of blogging as a strategy to engage students and improve students writing especially within context of large class sizes

The 5 C’s of Literacy and Literary Skills Development: Conversations, Community, Collaboration, Creativity, and Connection

Michael Griffith
Australian Catholic University

Diana Simmons
Australian Catholic University

Wai-Leng Wong
Australian Catholic University

Simon Smith
University of South Australia

The use of blogging has been explored on how it can enhance and extend support for student participation and learning: as collaborative learning spaces, for increased participation and interaction amongst students, as a valuable asset to the learning schedules of large cohort university teaching, for promoting writing skills. The limitations and lack of perceived benefits have also been acknowledged in some studies. At our university, blogging has been applied in a course to enhance the engagement of students in the study of literature, to extend community with peers, and to build skills for future employability. It is precisely because of the less formal nature of the blog, one more in harmony with students' own social networking practice, that this Web 2.0 tool segues so effectively from students' native skills into the academic arena. The increasing use of social media in academic contexts has however, raised the question of whether the largely informal nature of Web 2.0 can act as a pathway to develop students' writing or if this could hinder the development of competence in academic discourse.

Keywords: Blogging, Affordance, Literacy, Literary, Digital

Introduction

The authors present preliminary findings into which aspects of blogging support students' development in literacy and literary competence. However, the authors also affirm the *affordances* of this social software in its capacity to facilitate a ‘‘participatory culture’’ amongst students and provide ‘‘low barriers to artistic expression and civic engagement, [strong] support for creating and sharing one’s digital productions’’ (Jenkins 2006, p. 3).

5Cs: Conversations, Creativity, Community, Collaboration and Connections

This preliminary analysis has been derived from the blogs of a selected group of first year (literature) students. Students have been required to complete a weekly blog entry of around 120 words responding to a series of questions (both creative and critical: http://michaelgriffith.livejournal.com). They are also asked to write at least one peer review each week of around 150 words. At the end of semester, students then have to shape their blogs into an e-Portfolio (created within WordPress/ currently Mahara). This e-Portfolio gives them an opportunity to showcase their best work and to write a critical, summative report on their experience over the semester.

The **conversations** that are enabled through these contexts are equally extensive: educational, social and creative. Students converse with each other in ways that are not possible within the busy lifestyle of a modern university and they are able to engage with their teachers in ways that break down barriers and create new opportunities for learning. One of the most powerful conversations that is realized through this technology is that which opens students to the world beyond their own unit of study and beyond their own campus. Tomes (2001) argues that technologies create new opportunities by "capturing the collaboration and communication between groups of learners and teachers in a form which allows that collaboration to become an educational resource for other students" (p. 222). There have been cases of students whose creative work has been noticed by professors in other parts of the world. Here are the beginnings of real global synergy.

Creativity is one of the strongest features that this technology gives access to. Students who have never had an audience before, suddenly find a space where creativity is released and responded to. Typical responses include: "I never knew I could write poetry before" and "It is wonderful to have a ready-made readership of my writing".

In writing critical and creative blogs on authors and topics students are collaboratively engaged in a **community** creating a digital context which supports their individual work on literature. This is a powerful agent for meaningful engagement. No longer is the student studying an author or idea in relative isolation, now they are sharing their enthusiasms and questions; they have a real sense of how their peers as a whole are engaging with the content. It is not necessary for them to wait till class to hear what others think. There is a living continuum of engagement with vitally meaningful content available at the click of the button on their iPad.

Collaborative learning is strongly sustained by the peer review process that is part of our teaching/ learning strategy. Peer review is an essential component of enhancing and developing a student's capacity in the areas of both literary and literacy development. Typically students are asked to peer review each other's work at least once each week (i.e. one student per week). While encouraged to be supportive in their comments they are also asked to make constructive criticism where appropriate. This allows the cohort to support collaborative learning as well as the development of editing skills, some of which are subject specific.

The interactive contexts for students using this technology are extensive **connections** are created. These engage students with a whole range of resources, human and technological: their peers, their teachers, the academic skills support sector outside their discipline, the array of digital contexts that offer themselves as an ever-growing cornucopia of expressive tools.

Impact on Literary Development

A student's literary development is deeply enhanced by expressing their understanding in written form in a forum where they can be heard by their peers and by their teacher. In the best cases it acts like an extension to face-to-face class time where ideas are expressed and critiqued both by peers and teachers. Some students who are less willing to share ideas in a face-to-face forum find their voice in this context. Because of the nature of the language requirement for blogs, students are also less inhibited to express what they really feel and often link their observations about literary texts with aspects of their own experience. This is something that can be well illustrated by student examples.

The word "literary" here refers to both a student's grasp of the specialised language of literary criticism, but also to their capacity to find their own creative voice through the imitation of an author's style (across all genres) or through being stimulated into writing their own original poem or short prose piece based on their own experience. In a blogging context, the word "literary" is expanded even further by virtue of the fact that students are no longer writing in a two dimensional media, but in fact have the full resources of the multimedia environment at their disposal. "Literary" now means not simply finding the *mot juste*, but also finding the capacity to embed creative or critical words in a context of well selected visual and/or aural elements -including all aspects of visual style enhancement- and through bringing a higher order of creative ability to their expression.

Impact on Literacy Development

The development of a student's literacy is a central concern for all users of this technology within a higher education setting. While the creative, literary developments that blogging can enhance are a central driving force to the use of this technology, the enhancement of a student's literacy, their ability to master the distinctive discourse of their subject specialisations, is of major concern to academic institutions always keen to enhance their academic credibility. It is for this reason that this study has this twin agenda: to explore the literary and also the literacy development of students' writing capacities, through the agency of blogging.

In the context of the Systemic Functional Linguistics school of thinking (SFL), Colombi (2006) argues that "the fundamental interconnectedness of language use, and the social context..." (p. 149) informs the basis of a course for developing academic literacy. This provides a strong argument for the underlying components of "educational blogging" as a powerful creative underpinning for what is required in the academic arena.

This also accords with what Starfield (2007) says about not "devaluing the multiple discourses students bring with them to university ... " (p. 878). The embedding of academic skills into this process indeed builds on such language capacities that they already have and further brings to the students' attention the conventions of academic literacy and an awareness of how register changes according to the audience and purpose.

Literacy Development within this context has of course one further connotation and that is the development of a student's digital literacy. This is something that many students already grasp well, being, as we know, "digital natives"; however the implementation of blogging as part of their academic discipline creates a new demand for them to develop their capacity in this area of literacy to a new level of competence. This is in fact what we have discovered, namely that some students have developed and mastered areas of their digital expressive powers- their digital literacy - in ways that they could not themselves have foreseen.

Pegrum has tellingly predicted:

> ... education must also prepare students for a social future where they have the technological and personal literacies to build their own digital identities and author their own individual narratives. It must prepare them for a sociopolitical future where they have the participatory and remix literacies to intervene in societal narratives. It must prepare them for a global future where they have the cultural and intercultural literacies to contribute to world narratives. The future of our individual liberties, our democratic political systems and our planet demand it. (Pegrum, 2009, p. 54).

Discussion

Students are tempted into writing informally on topics of great personal significance (issues of personal identity they encounter in reading literature along with the triumphs and tragedies of the authors and their characters) and then find themselves deeply engaged with their own lives and with other lives (both those of their peers and those of the authors they are studying) (Pegrum, 2009).

Such engagement inevitably leads to a discovery that writing is a tool that liberates students' understanding and it is upon this basis that further engagement with academic skills is supported. At our university we have underpinned this organic process by embedding the work of our Academic Skills unit directly into Arts and Education degree literature units. Students find that work on their blogs can lead to an enhanced understanding of what is needed to improve their writing skills both as a medium of creative expression and as the central part of their academic equipment. Moreover there is a wonderful synergy created between the following key elements of a student's experience at University: their academic work, their fellow students, their lecturers, their academic skills support unit and finally with the technology that is the most powerful and ever advancing component in their armoury of equipment (Pegrum 2009).

An educator of some real standing in the American community, Parker Palmer, writing well before the onslaught of the digital age, has expressed powerfully a profound justification for the ways in which Web 2.0, in particular blogging, can achieve the highest educational aims:

> … to teach is to create a space in which the community of truth is practiced…. I need to spend less time filling the space with data and my own thoughts and more time opening a space where students can have a conversation with the subject and with each other… (Palmer, 1998, p. 120).

While students demonstrated a remarkable capacity in their blogs to engage both critically and creatively with the literature being studied, an initial discourse analysis of the responses to critical tasks revealed that many of the first year students had not yet achieved full control of the conventions of formal academic writing. In order for them to be able to display their work in the e-Portfolios to its best advantage to possible future employers, it was proposed to embed the development of academic literacy into their literature course.

Challenges of Managing Large Classes

The use of digital technologies like blogging, brings with it a plethora of challenges especially for large classes:

- Managing students' feedback in a timely manner,
- Managing students' expectations,
- Load issues for staff and students.

Some of the strategies that we are currently exploring include:

a) Use of peer review to provide feedback (Tomes, 2001)
b) A network of informal support comprising other staff, for example embedding academic skills support
c) Use of semi-automated quality feedback (Burrows & Shortis, 2011)

Conclusion

The work that is proceeding in this paper, will extend the current research to a wider group using design-based research; it will continue to look at literary and literacy skills development and implications for sustainable practices; it will comment on the use of semi-automated quality feedback, cross-faculty model of blogging; it will further explore the involvement of academics and especially the embedded involvement of academic skills. It is the authors' intentions to study closely the impact of these technologies on a cohort of students over the next three years. This then is an ongoing study which, it is hoped, will fine-tune the strategies for effectively implementing Web 2.0 technologies as part of the deep learning process in Higher Education across the curriculum. It is anticipated that a further discourse analysis of the students' work will be conducted during the second semester concentrating on systemic functional linguistics (interpersonal; logical) with a focus on what students are actually learning through the agency of blogging.

Facilitating motivation through support for autonomy

Maggie Hartnett
Massey University

With the increasing ubiquity of new technologies, many claims are being made about their potential to transform tertiary education. But in order for this transformation to be realised a range of issues need to be addressed. Research suggests that student motivation in technology-rich learning environments is one such challenge. This paper reports on one aspect of a larger study that investigates the nature of motivation to learn in online environments. Using self-determination theory (SDT) as an analytical framework, the focus here is on the underlying concept of autonomy. Ways in which certain social and contextual factors can foster perceptions of autonomy, and in turn motivation, are explored. These factors can have a supportive effect on learner motivation. Most prominent among these are the relevance of the learning activity, promotion of interest and active learning opportunities.

Keywords: motivation, e-learning, autonomy, self-determination theory

Introduction

The rapidly changing nature of technology is having a dramatic impact on how, where and when we choose to learn (Harasim, 2012). Educational institutions including universities are no less affected (Haythornthwaite & Andrews, 2011). In such a rapid time of change, it is critical that we are cognisant of factors that contribute to learning success in technology-mediated environments. Motivation is one such factor (Bekele, 2010). Perceptions regarding the motivation of online learners have developed out of earlier distance education models (Moore, 1993) and adult learning theories (Knowles, 1984) that consider such learners as independent, self-efficacious and having high motivation to learn (Bates, 2005; McCombs & Vakili, 2005). But as the student population becomes increasingly diverse, the boundaries between traditional and informal learning environments blur and new forms of online learning such as massive open online courses (MOOCS) experience high dropout rates (Mackness, Mak, & Williams, 2010), these underlying assumptions are being questioned (Haythornthwaite & Andrews, 2011). A growing body of research highlights motivation as an issue requiring further investigation in online contexts (Artino, 2008; Bekele, 2010; Hartnett, St. George, & Dron, 2011).

Literature review

"To be motivated means *to be moved* to do something." (Ryan & Deci, 2000a, p. 55) Motivation involves goals that provide the impetus for purposeful action with an intended direction. Inherent in this definition is the notion that motivation is a process rather than an end result. As such, it must be inferred from actions such as choice of tasks, persistence, effort and achievement, or from what individuals say about themselves (Schunk, Pintrich, & Meece, 2008).

Understanding the complexity of motivation is important because it has practical implications for online instructors and instructional designers as well as learners. For example, motivation to learn has been shown to play an important role in determining whether learners persist in a course of study, the level of engagement, the quality of work produced, and the level of achievement (Schunk, et al., 2008).

Contemporary views of motivation emphasise the situated, interactive relationship between the learner and the learning environment (Turner & Patrick, 2008). Just as motivation is a key factor in learning and achievement in face-to-face educational settings (Brophy, 2010), so it is in online learning environments (Bekele, 2010). Despite this, existing research in online contexts are limited both in number and scope, as others have noted (Artino, 2008; Yukselturk & Bulut, 2007).

Motivation to learn online

Various frameworks have been used in studies of motivation in online contexts. These include: Keller's (2008) ARCS (attention, relevance, confidence and satisfaction) model (Huett, Kalinowski, Moller, & Huett, 2008), self-efficacy (Moos & Azevedo, 2009), goal orientation (Dawson, Macfadyen, & Lockyer, 2009), interest (Moos & Azevedo, 2008), intrinsic–extrinsic motivation (Xie, DeBacker, & Ferguson, 2006) as well as various combinations of these constructs (Lin, Lin, & Laffey, 2008; Yukselturk & Bulut, 2007).

One theory used to investigate learner motivation in online environments is intrinsic and extrinsic motivation. “Intrinsic motivation is defined as the doing of an activity for its inherent satisfactions rather than for some separable consequence” (Ryan & Deci, 2000a, p. 56). Intrinsic motivation often results from the challenge, interest or fun an individual derives from an activity. In contrast, “extrinsic motivation is a construct that pertains whenever an activity is done in order to attain some separable outcome” (Ryan & Deci, 2000a, p. 60). Extrinsic motivation is associated with a source outside the activity itself, such as undertaking a course of study to improve future career prospects. Research suggests that individuals who are intrinsically motivated are more likely to undertake challenging activities; be actively engaged and enjoy learning; adopt a deep approach to learning; and exhibit enhanced performance, persistence, and creativity (Brophy, 2010; Ryan & Deci, 2000b).

Self-determination theory (SDT) (Ryan & Deci, 2000a) is a contemporary theory of intrinsic-extrinsic motivation that is built on the fundamental premise of learner autonomy. SDT argues that all humans have an intrinsic need to be self-determining or autonomous (i.e., experience a sense of agency and control), as well as competent and connected, in relation to their environment. When autonomous, students attribute their actions to an internal locus of causality; and experience a sense of freedom and choice over their actions. SDT states that if the environmental conditions are such that they support an individual’s autonomy (as well as competence and relatedness), then more self-determined motivation will be promoted with intrinsic motivation being the most self-determined (Ryan & Deci, 2000a).

A number of studies have used SDT to explore students’ reasons for engagement in online environments. Comparative studies are common (Shroff & Vogel, 2009; Wighting, Liu, & Rovai, 2008) and findings have indicated that online students were more intrinsically motivated than their on-campus counterparts. Other research has suggested that learners’ perceptions of autonomy were predictive of both intrinsic and extrinsic motivation (Huang & Liaw, 2007); intrinsic motivation was associated with greater exploration of the learning environment (Martens, Gulikers, & Bastiaens, 2004); and intrinsic goal orientation was significantly positively correlated with online success (Yukselturk & Bulut, 2007). Together these studies have suggested that learners’ perceptions of autonomy are important in fostering online students’ intrinsic motivation.

SDT has also been utilised to identify contextual factors that support intrinsic motivation (Harper, 2009; Rovai, Ponton, Wighting, & Baker, 2007; Shroff, Vogel, Coombes, & Lee, 2007; Shroff, Vogel, & Coombes, 2008; Xie, et al., 2006). Collectively, these studies have demonstrated that feedback, well-designed discussion topics, the instructor’s role in online discussions, clearly stated guidelines, choice, competence, challenge, interest, relevance and collaboration all influenced student intrinsic motivation to learn in the various online learning contexts. However, the study by Xie et al. (2006) was the only one to draw on multiple perspectives by incorporating instructors’ points of view on the purpose of online discussions. Furthermore, none of the above studies clarified which of the different psychological needs of SDT were supported by the identified contextual factors influences. It can be argued, for example, that clearly stated guidelines and well-designed discussion topics guide, clarify and facilitate the learning process thereby supporting a learner’s need to feel effective and competent. In other words, it is the support for learners’ competence needs rather than their autonomy needs that fostered the observed intrinsic motivation in these studies.

The current research sought to go beyond existing research by using the underlying concepts of SDT (i.e. autonomy, competence and relatedness) as critical lenses to untangle the multiple influences on motivation that combine in complex ways in different online contexts. By doing this, it is possible to shed light on the ways in which the different psychological needs of learners are affected by a range of social and contextual influences.

Method

This paper presents findings of one aspect of a wider study (Hartnett, 2010) that explored the motivation of pre-service teachers situated within ‘real-life’ online learning contexts. While the main study explored and identified a broad range of influences that supported or undermined learners’ autonomy, competence and relatedness needs, results presented here focus on those factors that fostered perceptions of autonomy among learners.

Case studies

This study was exploratory in nature and sought to identify, explore and understand pre-service teachers’ online learning experiences as they related to their motivation to learn in specific online contexts. Therefore, the methodology adopted was case study because such an approach can be of value where the research aims to investigate a complex phenomenon embedded in the real world, where the scope is difficult to define and can only be understood within context (Gillham, 2000; Yin, 2009). Purposive sampling methods (Patton, 2002) were used to select two information-rich cases. Although the broader institutional context was beyond the scope of the wider study, the effect such influences can have at the situational level have been noted previously (Vallerand & Ratelle, 2002). Potential cases were therefore identified from the same programme within the same institution in order to reduce differential contextual influences at the institutional level. Cases were chosen based on predetermined criteria of importance to ensure relevance to the research question. In particular: (a) courses were required to be predominantly web-based, with only limited resources provided by alternative methods such as print; and (b) students were required to participate in the online learning community as an integral part of their assessed coursework.

Procedures

Ethical consent to undertake the study was gained prior to the collection of data. Data collection procedures comprised online questionnaires, interviews, online asynchronous discussion transcripts and course resources. Findings presented here draw on interview and open-ended questionnaire responses in addition to online discussion transcript data and were collected after the relevant learning activities had been undertaken.

Both inductive and deductive analysis occurred within this research investigation. While self-determination theory (Ryan & Deci, 2000a), provided sensitising concepts with which to explore the qualitative data (Blumer, 2006), an inductive approach geared to allowing additional patterns, themes and categories to emerge from the data, occurred concurrently (Bogdan & Biklen, 2007).

This process involved reading and re-reading all qualitative data to get a sense of the breadth of responses and the possible range of codes needed to identify themes. Each theme was assigned a code and each coded piece of text was placed at a “node” named in such a way that it described the essence of the idea identified. In this way, chunks of text with similar ideas were able to be stored together. These pieces of text varied in length and were coded at all relevant nodes depending on whether single or multiple themes were identified.

Context and participants

The two courses that provided the context for the case studies were situated within the larger context of a pre-service teacher education programme within a New Zealand tertiary institution. Students in this programme were preparing to teach in New Zealand primary (i.e. elementary) schools. These courses were considered Internet-based rather than fully online because students received some print material (study guide) and digital resources (CD-ROM – Case Study One) at the beginning of their course. The online learning platform used for online communication and most content delivery was the WebCT Learning Management System. The boundary for each case study centred on one assignment and its associated online activities. In both case studies, all participants had similar prior experience of online learning and group assignments.

While both cases were chosen from courses within the same programme, the instructional design of each was different. Case Study One was situated within a compulsory integrated science and technology course. Teaching staff consisted of a course coordinator with science expertise and a tutor with technology expertise. The tutor was responsible for most of the online teaching and management of the course and focused on use of online resources and facilitating related asynchronous discussions. Students usually took this course in the third and final year of their degree. The case study itself focused on a Problem Based Learning (PBL) assignment worth 60% of the final mark. This was undertaken over a six-week period in which students were required to work collaboratively in small groups. PBL is an instructional approach built around authentic, ill-structured problems which are complex in nature (Schmidt & Moust, 2000).

Case Study Two was positioned within an introductory social studies curriculum course that formed a compulsory component of the same programme. Students usually took this course in the second year of their degree. An individual micro-teaching and reflection assignment (with associated online activities), which required students to plan and teach two consecutive lessons in a school of their choice and then reflect on their experience, formed the boundary for Case Study Two. Students completed this assignment over a four week period and it was worth 40% of the final mark. The course coordinator was responsible for all online teaching throughout the semester.

A total of 21 student participants took part in the two case studies (12 in Case Study One and 9 in Case Study Two) and three lecturers (2 in Case Study One and 1 in Case Study Two) and were recruited from the semester one (February – June) 2008 online offering of each course. Participants were located throughout New Zealand

and undertook their courses at a distance from the main campus. The respondent group comprised two males and 19 females (one male in each case study). Participants' ages ranged from 18 to 55 with 90% in the over 24 age group.

Findings

As mentioned previously, self-determination theory is used as an analytical framework. The fundamental premise of SDT is that perceptions of autonomy, competence and relatedness (Ryan & Deci, 2000a) contribute to self-determined forms of motivation (Hartnett, et al., 2011). Only the situational influences that provided support for the autonomy needs of learners are reported here.

A range of important social and contextual influences were found within each case study that served to support learners' autonomy needs, thereby facilitating the expression of more self-determined motivation. Themes common to both case studies and others unique to one case are summarised in Table 1.

Table 1: Autonomy supportive influences that support high quality motivation

Autonomy Supportive themes	Case Study 1		Case Study 2	
	Frequency count	Students identifying theme (n=12)	Frequency count	Students identifying theme (n=9)
1. Task relevance & meaning ▪ professional ▪ personal	68	8	55	9
2. Interest ▪ situational ▪ personal	50	7	52	9
3. Actively use knowledge in practice	29	6	32	9
4. Significant role in group decisions & tasks	25	7	-	-
5. Autonomy supportive lecturers	18	5	20	6
6. Provision of choice	17	6	19	9

The *relevance and meaning* of the activities emerged as the most salient theme that supported the autonomy of participants in both case studies. Within this major theme, two key sub-themes emerged: *professional relevance* and *personal relevance*. Comments such as 'this assignment was exactly what the course is about and indeed what we are studying to be is all about – teaching' (Student2, CS2, questionnaire) and 'an authentic problem that was happening in our community that was … meaningful … that was motivating' (Student11, CS1, interview) were indicative of comments from participants across the two cases.

The autonomy needs of learners were further supported through the promotion of *interest* in two distinct ways. Online discussions that were considered 'quite hot topics … [and] got us talking … I got the impression that people were participating quite regularly because it's just interesting' (Student1, CS2, interview) and the use of authentic learning approaches such as problem based learning that emphasised 'the fun of actually trying to create some experiments' (Student7, CS1, interview) were some of the ways in which *situational interest* (i.e. features of the learning activity itself that participants found interesting) was promoted. Moreover, activities that provided opportunities to pursue *personal interests* were key mechanisms that supported autonomy as revealed by the following comments 'I decided to take it into the fact or opinion kind of evaluation or you know inquiry aspect of that, that intrigues me. I mean anything to do with getting kids to think about why they are thinking, fascinates me' (Student7, CS2, interview); and 'science and technology are my favourite things' (Student8, CS1, interview).

Being able to *actively use knowledge in practice* was also seen as important and valuable and was next most prominent theme highlighted by learners across both cases. The following remarks indicate what this meant to learners: 'it was a very hands on/practical assignment which not only put the theory into practice but it also replicated exactly what would happen within the classroom situation' (Student9, CS1, questionnaire); and 'I think it was probably the best thing that you could do … you know, you learn all about social studies … and then you are faced with the problem well, how am I going to teach that? You know, it's like, oh wow okay, I've just read all about it, so now I have to actually work out for myself how that's going to go' (Student2, CS2, interview).

Perceptions of having played a *significant role in group decisions and ta*sks also contributed towards learners' autonomy in Case Study One (a collaborative task) but not Case Study Two (an individual task). This occurred in groups where learners were supported by their peers to contribute to group decisions and tasks by having 'your say on everything' (Student8, CS1, interview) to ensure 'we all know that this is what we're doing now and summarise what we'd been talking about and that we're all on the same page' (Student4, CS1, interview). In contrast, the individual nature of the assignment in Case Study Two, that afforded learners a clear sense of autonomy, meant that fellow students were not perceived as central to influencing learners' sense of agency as the following comment indicates: 'it was really valuable … to have the experience of making your own choices and making your own mistakes or your own successes' (Student1, CS2, interview).

A further theme to emerge was the autonomy-supportive approaches adopted by the lecturers. Statements like 'I think it's healthy when they decide because the ownership is on them and they're not being pushed' (Lecturer1, CS1, interview); 'students identifying their own opportunities so they get that sense of … ownership right from the start, it's not imposed upon them' (Lecturer2, CS1, interview) and 'for me it's a sharing of power' (Lecturer, CS2, interview) indicate that support for learners' autonomy was a consideration for lecturers in both case studies. This translated to learners' perceptions of autonomy most consistently in Case Study Two (see Table 1) as the following comments indicate 'we weren't told this is the way I want your groups to be. Or this is the way that I want you to do it but we were given options' (Student3, CS1, interview); 'I loved how she brought it across because she wasn't serious and this is how it is and this is how it's going to be and she gave us the freedom to explore' (Student3, CS2, interview) and 'Isn't it lovely to feel worthwhile & capable & valued' (Student9, CS2, online transcript).

A final significant theme to emerge that supported participant autonomy was the perception of many choices being available to them. The *provision of choice* was seen as freeing and having no limits, as the following remarks attest: 'choice is very important to me in a motivational sense' (Student7, CS2, questionnaire) because it allowed learners to 'choose what was of personal importance to me, to my life' (Student10, CS1, questionnaire).

Discussion

In the discussion that follows, it is important to note that no one factor supported all the autonomy needs of learners on its own. Rather, learners' *perceptions* of the extent to which their needs were met were formed from multiple influences that combined in complex ways that were dependent on the learning environment in which they were situated.

Relevance and meaning

Across the two case studies, the importance of the learning activity in terms of its relevance and meaning emerged as a central theme that fostered perceptions of autonomy resulting in the expression of more self-determined motivation among learners. Within this, two clear sub-themes were identified in terms of what participants found relevant and meaningful about their respective assignments. First, participants who saw a clear link between their own experience during the activity and its relevance to their future teaching practice expressed feelings of autonomy. Expressions of autonomy were reported by participants across both cases but most consistently in Case Study Two. For these learners, the usefulness or utility value of the activity (i.e. a means to achieving a future goal) they were undertaking was clear and something they identified with. Highlighting the relevance and applicability of an activity (to future goals) has been identified previously in the literature as an important strategy for supporting the autonomy needs of learners that results in more self-determined motivation (Brophy, 2010; Reeve, Ryan, Deci, & Jang, 2008).

In addition to professional relevance, the second sub-theme was the personal relevance and meaning the activity engendered for participants. Being able to make connections from the course content to their everyday lives, in terms of existing interests and prior experiences, enhanced the meaningfulness of the task and encouraged personal involvement for the majority of participants. Support for personal relevance and task value being important sources of motivation to learn in online contexts can be found in a number of previous studies (Artino, 2007; Xie, et al., 2006; Yukselturk & Bulut, 2007). Beyond affirming existing research, this finding has further significance because it demonstrates that the relevance and meaning of an activity is not just important for learner engagement online but that it influences the quality of learners' motivation, by providing support for autonomy needs.

Interest

The primary way in which learners' interest was supported in both case studies was through the promotion of situational interest – interest generated by certain conditions in the learning environment (Hidi & Renninger, 2006). Interest is always content specific (Krapp, 2002). Situational interest was promoted and sustained in Case Study One through the use of problem based learning as an instructional strategy which encouraged participants to engage with science and technology content. Participants expressed interest in at least one aspect of the PBL process – a new learning approach for the students and one that had direct relevance to pre-service teachers as a model of practices that might be used in their own teaching. Examples included the collaborative nature of the activity and the potential for various approaches to solving the chosen problem. This interest was further supported by the lecturers who encouraged students to pick a topic that piqued their interest and/or had personal relevance.

Similar to Case Study One, participants in Case Study Two were also encouraged to focus on a topic that was personally meaningful. Additionally, the lecturer created on-going situational interest by the inclusion of regular online activities and resources that were topical, relevant and meaningful, both personally and professionally. The promotion of situational interest is an important finding. This is because it demonstrates that while the potential for interest lies within the individual (Hidi & Renninger, 2006), the situation – in this case the teaching approach – also has an important bearing on its development and, in turn, the motivation experienced by learners.

In addition to participants finding aspects of the learning environment interesting, personal interest – an individual's preference to return to a particular area of content over time (Hidi & Renninger, 2006) –also emerged as an important theme. When the choices available were perceived as appealing, this allowed learners to align learning activities with their individual interests. Participants identified the opportunity to choose the topic of the assignment, in particular, as key to this alignment process. The main difference between the two cases was that the majority of students from Case Study Two (see Table 1) expressed a strong, well-developed, pre-existing individual interest in social studies content which was further enhanced by the autonomy supportive context of the micro-teaching task. Opportunities to link learning activities to areas of personal interest have been shown previously to support autonomy thereby promoting more self-determined motivation (Hidi & Renninger, 2006; Reeve, et al., 2008).

Actively use subject knowledge in practice

Students liked being active and being able to put into practice what they were learning in an authentic way. Participants from both case studies highlighted having opportunities for action as a key feature that helped them to understand the importance, relevance and value of their respective tasks, particularly to their future teaching practice. Tasks that involve a high degree of participation and activity have been shown to promote motivation (Reeve, Deci, & Ryan, 2004), learner engagement and encourage deeper understanding (Brophy, 2010).

Significant role in group decisions and tasks

Learners in Case Study One who played a significant role in their group's decision-making processes and completion of tasks, perceived their peers as having contributed to supporting their autonomy needs. In other words, they believed their contributions were not only endorsed by their peers but also influenced the overall action taken by the group. Whether this took the form of collective decision-making processes or the role of leader, participants perceived their peers as supporting their need to be self-determining.

Support by peers for the autonomy needs of their fellow learners did not feature in Case Study Two. This was due to the independent nature of the activity. While participants did consult with their peers before making decisions about choice of topic, teaching approach and possible resources, decisions were not dependent on the suggestions made by other students.

Autonomy supportive lecturers

The ways in which lecturers communicated expectations and feedback was important to learners. The provision of clear expectations and feedback using informational, non-controlling written language was identified by students as a feature of the lecturer's communication style that they considered autonomy supportive (as well as supportive of competence needs). This informational style revolved around information-rich messages that identified what was required, written in a way that conveyed flexibility and personal responsibility to the learner rather than seeking compliance through control or coercion. The use of explicit, detailed information that clarifies what is required without seeking to control behaviour has been identified previously as an important characteristic of autonomy supportive teachers (Reeve, 2009).

Provision of choice

The provision of choice emerged as a final prominent theme that learners identified as supportive of their autonomy needs. Across the cases, participants who perceived themselves as having choice identified several areas where they were given opportunities to choose. These included: the topic they focused on, how they went about it, and the presentation of their work. Case Study One learners also identified the opportunity to choose their peers as a further key area where they could make their own decisions. However, this tended to occur only for those students who approached other learners early on in the process and therefore had more potential group members from which to choose.

Being given opportunities to choose how and when to act, in ways evident in these case studies, promoted perceptions of choice, a sense of control and greater volition similar to previous research results (Van Etten, Pressley, McInerney, & Liem, 2008). Here, the provision of choice was autonomy supportive because it provided opportunities to pursue topics and activities in ways that were interesting, relevant and meaningful. In other words, the choices offered were not seen by these participants as trivial or superficial as can sometimes be the case with, for example, option choices (Reeve, Nix, & Hamm, 2003).

In summary, six important themes emerged as facilitating perceptions of autonomy across the two case studies. The different ways in which the psychological autonomy needs of learners were supported were, in turn, influential in fostering the expression of more self-determined motivation. It is interesting to note though, that some factors were identified as supportive or undermining of learners' autonomy needs depending on an individual's perception. This highlights the complex and interactive relationships between the learner and learning environment that influence motivation (Turner & Patrick, 2008).

Implications

This study has demonstrated that perceptions of autonomy by learners (which contributes towards how self-determined they feel) were influenced by online teaching practices, the design of learning activities and the social aspects of the tasks in which they were engaged. This is hardly new or surprising given our current understanding of the situated nature of learning in traditional (Lave & Wenger, 1991) and online (Wegerif, 1998) contexts. What is new is the consideration of these influences from a motivation perspective (through the analytical lens of autonomy from SDT) and the findings that, similar to learning, motivation is also situated in particular contexts. The implication is that differing circumstances of students within the learning context need to be considered and, where possible, accommodated in order to support the learner's psychological need for autonomy and the expression of high quality (i.e. more self-determined) motivation among learners.

Limitations

As with all research, there are a number of limitations with this study. The use of case study methodology meant that research findings are associated with particular chosen contexts, namely two courses that formed part of a pre-service teacher education programme within a single New Zealand university. This limits the transferability or usefulness of findings to other online practitioners in diverse settings. However, the primary intention was to explore environmental influences on learners' motivation, not to generalise to the wider population of online learners.

Conclusion

Using self-determination theory and the underlying concept of autonomy, this study has uncovered a range of social and contextual factors that facilitated perceptions of autonomy among learners. Importantly, learners' autonomy, and therefore motivation to learn, was shown to be facilitated by specific online teaching practices, design aspects of learning activities and the social aspects of tasks in the contexts described here.

The identification of a range factors that support learner agency offers practical assistance in supporting our understanding of the dynamic interplay of influences that can support student motivation in online contexts. While this is by no means a definitive list, the factors identified may help in the creation of useful guidelines for teachers and instructional designers when considering the development of and teaching within online educational contexts. The interplay of factors will vary within any given context and be different for individual participants but unless this complexity is recognised and understood, we run the risk of not being fully prepared to face the challenge of developing practices that support the motivation of learners in the future.

Moving down Stream: Using e-technology to enhance social work field education

Kathryn Hay
Massey University

In 2009, Massey University introduced Moodle (aka Stream) as an institutional innovation to support and enhance teaching and learning. The social work field education (practicum) programme has embraced Stream as an opportunity to creatively advance current educative practices. The development of a meta-site for field education provides academics, students and field educators[1] a forum in which field education can be advanced. This paper will outline the rationale for a research project that examines the perspectives of field educators and academic staff on the opportunities and challenges associated with on-line teaching and learning in the field education area. The research will assess the value of the Stream environment and consider ways in which the current innovation can be further developed.

Keywords: online environment, Moodle, field education, community of practice

Background

Massey University, a multi-campus and dual mode university in New Zealand, aims to provide higher education of a quality and kind that will enhance the capabilities, potential and intellectual independence of its students, on a life-long basis (Brown, Argyle, Kendall & Sandbrook, 2011; Massey University, 2009). The introduction of Moodle (known as Stream) in 2009 sought to provide students with an engaging, rich-media environment (Brown et al., 2011). As an online environment it is intended to be connected, innovative, flexible and relevant to learners (Bates, 2010; Kehrwald, 2011).

In the Bachelor of Social Work and Masters of Applied Social Work programmes at Massey University students are required to undertake two 60-day practicum in social service agencies. Students may study either internally or by distance and the practicum may be located throughout New Zealand. Students are, in the main, supervised and supported by a registered social worker in the practicum agency. These field educators commit to educating and assessing a student throughout the practicum period, however, they may have had no or minimal training for this role. Field educators may lack confidence, specialised knowledge or pedagogical skills required to ensure student learning (Chilvers, 2011). Voluntary face to face training for field educators supervising Massey University students is restricted to two or three regions each year and may not be attended due to, for example, workload commitments, geographical location, health or interest.

Field educators communicate directly with academic staff during the planning stage of the practicum, they are visited approximately mid-way through the practicum by an academic staff member, and they may choose to phone or email staff if any concerns arise. Aside from this contact the field educator is largely isolated from the University.

From our experience positive relationships between the University and agencies as well as clear expectations and understanding of the field educator role are more likely to ensure quality practicum. Given the time and resource constraints on both academic and agency staff we question whether online technologies, and specifically Stream, can be used more effectively for the benefit of field educators. In 2011 we began to re-develop the Field Education Stream site that had initially been established for practicum students so that it was more relevant and accessible to field educators. Access is offered to all field educators although acceptance of this invitation is required. At present asynchronous modes of communication are utilised; primarily a news forum, text and audio resources, as well as relevant university documentation.

Stream also has the potential to be used as a forum in which academic staff can provide feedback and encouragement to field educators as student's progress through the practicum. It may also be a place where field educators can connect with one another thus developing a community of practice where ideas and strategies may be shared. Academic staff could also use Stream to facilitate and guide field educators in their often challenging roles as educator, coach, mentor, supervisor and assessor. Stream might also offer a quality

[1] Field educator refers to the person in a social service organisation that is supervising and supporting a student throughout a 60-day practicum. This person is usually a registered social worker.

learning environment which may be of particular value to field educators who are new to the role or who have not been able to attend face to face training with the University (Garrison and Vaughan, 2008).

The Stream site then may offer a new opportunity to support the ongoing learning of field educators. This is important as part of our professional commitment to supporting and strengthening the social work profession and to benefit our students as learners in the practicum environment. Through building positive relationships and offering valuable resources to the field educators they in turn may better support students, the university and the wider social work profession. In the current competitive environment the provision of appropriate incentives to field educators, such as relevant resources, may also assist in retaining quality practicum opportunities.

Evaluating the Stream site

The potential functions of the Stream site may include enhancing relationships; developing a community of practice; augmenting professional knowledge and practice; and ultimately improving student learning. There is however no compulsion for field educators to be active in the Stream setting and so a learning environment that is relevant, flexible, convenient and accessible is necessary (Cleveland-Innes, 2010). We are particularly interested in exploring how the Stream site can be connected, innovative, flexible and relevant to field educators as learners. At this point it is unknown whether the field educators are interested in such a learning forum or what type of digital environment they might prefer to enhance their professional development as field educators.

A formative evaluation of the Field Education Stream site will gather information to guide future decisions as to the shape and function of the site so as to enhance its quality and effectiveness (Reeves and Reeves, 2012). The research involves a literature review and semi-structured interviews that will collect the perspectives of field educators who have accessed the site, field education staff who have used but not developed the site, and a teaching and learning consultant.

Stream as connected

The Stream site is currently accessed by only a few field educators. These people primarily view the assessment documentation and resources related to supervision. Access is only occurring during the period that students are on the practicum. This raises questions as to how best to connect with field educators when students are only on practicum for a three month period once during each year. Field educators may also choose not to take students every year.

It is important that assumptions are not made as to engagement, connecting or collaboration. While academic staff may prefer to increase interactions between themselves and field educators during and outside of the practicum period this may not be a shared goal. Elements of collaboration already exist between the university and field educators as they both endeavour to ensure a successful practicum (Zepke and Leach, 2010). However, field educators may differ in their preference to develop stronger relationships with the university, particularly through an online environment. At this point field educators have not indicated a desire to develop or participate in a field education learning community that may ‘collaboratively engage in purposeful critical discourse and reflection to construct learning that is personally meaningful’ (Reeves and Reeves, 2012, p.120). Building a community of practice takes considerable time and requires strong leadership. Furthermore it will only be successful if there is sufficient interest and commitment (Hay, 2011).

Developing the Stream site then needs to be purposeful to ensure that there is responsiveness to the needs and preferences of the field educators (Garrison and Vaughan, 2008). A series of questions may be asked: Do field educators want engagement and connection through Stream? What type of connections do they want? How can this be delivered? When do they want to be connected? Who do they want to connect with?

Stream as innovation

Learning technologies such as Stream may involve tools for information delivery, tools to provide active learning, and tools to provide knowledge. These tools may have value for field educators who are working as professional social workers as well as educating students on practicum. No monetary resources are transferred from the university to social service agencies for practicum students. While there is an implicit expectation of reciprocity with the student expected to positively contribute to the work of the agency during the practicum the reality is that the benefits for the agency are often less than for the university (Shardlow, Scholar, Munro &

McLaughlin, 2012). Offering digital resources and an opportunity to become more connected with the university and other field educators may be seen as a benefit for field educators. As a digital environment Stream offers an innovative means of interaction that may be immediate despite geographical distance. It may also become an online training environment that can be accessed by field educators when convenient. The inclusion of a range of resources, whether text, video or audio, may also support field educators to continue their own professional learning and development. While the Stream site is innovative in the sense that it is accessible for field educators rather than only students it is important that consideration is given to how the site can be 'a learning environment that encourages learners to seek, find, analyse and apply information appropriately' (Bates, 2010, p.23). Questions to be posed include: What tools are of most relevance and value to the field educators? What resources do the field educators want to access? What will motivate the field educators to access this online environment?

Stream as flexible

Designing a flexible as well as relevant and accessible online environment is likely to be of greater benefit to field educators. Field educators will come to the site with various understanding and knowledge about digital resources. To be of value then the site may need to include a range of strategies and tools so that diverse needs are met. At present, the site is largely a repository of print resources and contains links to relevant professional websites and podcasts. Resources have been categorised to enable easier searching. A news forum is used to convey messages from academic staff. Curriculum resources, for example assessment documentation, are also available. There is potential for a broader use of tools, for example, discussion forums or chat. Audio messages from university staff could also be used as a means of support, teaching and encouragement. Questions however remain as to the value, purpose and likely use of these by field educators especially given the voluntary access to the site, the workloads of the field educators and their perceptions of the accessibility of the Stream site.

Stream as relevant

Field educators are both educators and learners whilst they support students on practicum. They are teachers of students with a responsibility to the university to support the student to meet the required learning outcomes. Further they are learners in their professional roles as social work practitioners as well as field educators. As life-long learners the Stream site could provide field educators with another learning environment. It is well-known that motivation is increased if tools and resources are seen as having value and being relevant (Bates, 2010). Achieving this is one challenge for offering digital resources to field educators. There is considerable diversity in field educators, not only in terms of their social work positions but also in respect of the time they have to engage, interest in using technology, interest in ongoing interaction with the university, perceived relevance of university-provided resources, and availability of technology. Incorporating authentic tasks may assist with increasing the perception of relevance (Reeves and Reeves, 2012). Questions in this domain include: How can the Stream site be of value to field educators? How can issues of diversity be addressed? What tools and resources are most of use to field educators in their dual role as educators and learners?

Conclusion

The Field Education Stream site at Massey University is currently designed for both students and field educators. Over the past two years academic staff have begun to shape the site so that it offers more relevant resources to field educators with the intention of better supporting them as both educators and learners. All field educators need to both understand and continue to develop in their critical roles. Receiving adequate training, feedback, encouragement and support is important to ensure the success of practicum (Chilvers, 2011). The Stream environment potentially offers a mode for creating better connections with field educators in an innovative, flexible and relevant way. The potential of the Field Education Stream site has at this point not been examined and thus provides the rationale for this research. The project therefore will seek the perspectives of field educators as well as draw on the expertise of key university staff so that informed decisions can be made as to any future developments. Field education is at the interface of academia and practice and university staff must ensure that all developments, including within digital environments, are responsive and of sufficient value to those whom they are intended (Chilvers and Hay, 2011).

This paper outlines the design of a study to investigate how a collection of example units was used as part of a wider training and support strategy during the transition between learning management systems. Example units can be thought of as a type of learning object or template from which innovative uses of learning technologies can be shared and used for professional development purposes in the design of online teaching spaces. Using a Developmental Evaluation approach, questions were asked about the authenticity and reusability of the example units to enhance their design in the next round of iterative planning. This paper will be of interest to Educational Developers and Academic staff interested in course design with technologies as well as co-ordinators of professional development strategies.

Keywords: Teacher professional development, technology, learning objects, evaluation

Introduction

Students' expectation of online learning, the approaches they take, their profile, and prior experiences with online learning have been documented in studies concerned with driving institutional change (Canole, de Laat, Darby, & Dillon, 2006; Collis, & Moonen, 2008). Students now expect materials that are rich, interactive, engaging, accessible, and that enable communication to cater for learning anytime, anywhere (Conole et al., 2006; Garrison & Vaughan, 2008; Oblinger, 2003). The latest releases of popular Learning Management Systems can act as a conduit to such demands but are they being used to their full advantage? The importance of the teacher role in the successful integration of technology in education is widely known and accepted. The role of adequate teacher support and teacher professional development (TPD) is seen as key to ensuring teacher engagement with and application of technology in their teaching (Collis, & Moonen, 2008; Lofstrom, 2007; McNeill, Gosper & Hedberg, 2011). There are a number of attributes (of TPD) that work well to support teachers in this regard. Studies identify constructivist learning, situated learning, collaboration, collegial networking, and access and support among others as conducive to teacher learning (Handal & Huber, 2011; Taylor, 2003). How can we design TPD to take advantage of such findings and lead to transformation of current teaching practice in the online space? What resources are needed to support and sustain this change? By providing templates, along with pedagogical and technical support to scaffold the adoption of technologies, can we bridge the gap between what the student expects and what the teacher is capable of delivering? What format must these templates take on if they are to be effective and sustainable?

Learning objects are any digital, reproducible and addressable resource used to perform learning activities, made available for others to use (Koper, 2003). Example units (or courses) are frequently used as a learning resource in technology training for their pedagogical affordances, and can also be viewed as patterns or templates for teachers. Each pattern addresses a problem and provides a solution. Example units showcase technology within an authentic setting that would enable teachers to draw links to their own classrooms and teaching (Taylor, 2003; Wells, 2007). Known qualities of an effective learning object are reusability (Koper, 2003; Watson, 2010), and the ability to be repurposed (Gunn, Woodgate, & O'Grady, 2005). Gunn, Woodgate, and O'Grady (2005) offer a sustainable approach to reusability involving teachers in a participative design process that results in a sense of ownership, acceptance and ability to realize the potential of technology in different contexts. This study aims to investigate the use of example units as an effective tool for facilitating teacher professional development in technology by evaluating their reusability, sustainability and authenticity.

Background

A major Metropolitan University recently transitioned from one Learning Management System (LMS), Blackboard, to another, Moodle as part of a larger technology enhancement project. The project followed a system development lifecycle (i.e. analysis, design and development, implementation, support and training, and evaluation). In a recent survey of students' expectations of technologies in learning at this university, students indicated that they wanted more flexible access to content, more opportunities for communication with teachers and peers and the convenience of online assignment submission (McNeil, Diao & Gosper, 2011). As part of the support and training strategy for staff, thirty-four example units were developed by the Educational Development group in collaboration with convenors from Faculties across the University with the aim of showcasing features of the Moodle platform across a variety of curriculum models and teaching scenarios. Some of the convenors had previously used the LMS for their online delivery and others were new to the field of online and blended learning.

A large-scale summative evaluation of this project is currently underway and this study reports on a work-in-progress project, a subset of the support and training evaluation. Focusing on the role of the example units, this part of the study aims to investigate their effectiveness in facilitating TPD in the area of technology integration, by asking how academics used the resource and looking at how they repurposed the designs.

Method

This study uses pragmatism as the theoretical paradigm in which to underpin the design. Pragmatism provides the opportunity to use multiple methods of data collection and is oriented towards "what works" and practice. (Creswell and Plano-Clarke, 2011, p.41). A Mixed Methods approach, with a Convergent Design (Creswell and Plano-Clarke, 2011, p.77) was used, enabling the collection of both quantitative and qualitative data to develop a complete picture of the use of example units and their effectiveness in the professional development in online learning design.

Two data sources were identified for this study. The first data set is quantitative in nature and involves collection of system-generated transactional logs to explore the patterns of use. Moodle has built-in reporting capability that provides a digital vestige i.e. a trace of events and actions. This is achieved using a Reports interface for access to logs and options for visualising this information (Hamuy, & Galaz, 2010). The second data set provides a pedagogical focus and involves an online survey to collect a mix of quantitative and qualitative data.

Evaluation Design

Since the aim of this study is to find out how example units were used as part of TPD, and improve their design for better reuse in the next iteration, a cyclical design framework known as developmental evaluation (Patton, 1994) is used. Developmental evaluation 'aspires to continuous progress, ongoing adaption and rapid responsiveness' (Patton, 1994, p. 313). The framework aligns with this study since these resources are available (online) for ongoing access and their currency is important. The analysis of the transactional logs inform answers to the questions 'What tools were of interest to the target group?' and 'What was the pattern of access of this set of resources?' Analysis of the findings from the user survey contribute towards finding how the example units (and their supporting resources) were accessed; the level of authenticity of the content (Taylor, 2003; Wells, 2007); the level of influence they had on the design of the user's own online unit (Gunn, Woodgate, & O'Grady, 2005); and the level in which the user's understanding of the new LMS was improved.

The transactional logs were analysed 6 months after the example units were made available as a resource for TPD. All teaching staff that had accessed the example units in this time period were invited to take part in an online survey (n= 314). The response rate was approximately 10% and participants were of mixed gender, and of mixed ethnicity, generally busy (time-poor), and varied in the level of ability and/or desire to use technology in their teaching. The survey was developed using a mix of criteria for TPD using technology and for learning resources (reusability) based on the literature of McDougall (2008) and Lawless and Pellegrino (2007). The survey comprised of 14 questions; 4 tick-box, 8 five-point, Likert scale (e.g. agree to disagree), and 2 open-ended questions (see Appendix A for a sample of the questions).

Initial Findings

The transactional logs have been analysed to investigate what tools were of interest to the target group and the access patterns to this set of resources. The most viewed tool in the example units was the Discussion Forum (31% of total tools viewed across all example units) and Database (27%). The least viewed tools were the Choice (online Poll) tool (3%) and the Workshop (peer review) tool (1.5%). Of the total view count of the example units (5620), there were twice as many views of the resources (3732) in these units than the tools (1888).

The survey results showed Quiz, Discussion Forum, Blocks and Lesson tools consistently rated highly in authenticity (Appendix A, Q.1), influence (Q.2) and impact to understanding (Q.3). Conversely, Chat, Workshop and Wiki tools scored the lowest. There were a number of questions in the survey which were designed to inform future design of the website from which these Example units are accessed. Findings showed that 56% of users preferred to browse the example units rather than search using keywords, they also preferred a listing by faculty rather than alphabetically and only 24% of respondents actually viewed the supporting videos (which accompanied the actual example units and consisted of 8-10 minutes where the convenor explained what functionality they had designed in.) Another administrative-type question asked whether there was an inclination to revisit the example units in the future (Q4.), only 35% of respondents said they would. When asked about the collaboration aspects of these resources (Q.6), only 42% of respondents were in agreement.

Discussion

The number of views per tool aligned with some findings in the literature. It is widely accepted that discussion forums are one of the most used tools in online learning for communication and for engaging with the course content (Garrison & Vaughn, 2008), therefore it stands to reason that the majority of our users would be interested to see how the Discussion Forum looked in the new LMS. The Database is a new tool to the LMS (i.e. not available in the previous LMS) so this high view count may be due to users wishing to explore the different scenarios of how this tool could be used. Conversely however, the Choice (Poll) and Workshop tools are also new additions in comparison to the previous LMS and were not viewed nearly as often. It could be the name of these tools that contributes to this finding, as one cannot immediately infer their functionality. In respect to the viewing of resources, particularly the videos, results will influence the next round of development since these were quite time consuming to produce. Additional probing questions will be included in the next phase of the study to explore the reasons for this.

The survey data corroborated the findings from the transactional logs. In agreement with Taylor, (2003) and Wells, (2007) it was found that content rich (authentic) tools generally performed better as measured by the number of views, influence rating and impact on understanding. Wiki and Workshop tools were an exception to this pattern. Both scored moderately for authenticity and impact on understanding but performed low for influence on future design. One explanation may be that both are LMS features that staff would not have encountered prior to the Moodle installation and may not yet feel ready to include them in their unit design. The number of responses stating they would revisit the example units was lower than expected, indicating that staff may have gleaned the necessary information on the first visit and felt no need to return. This will be developed into an interview question for the next phase. If new example units (showcasing new features) are developed then this may encourage staff to return to the site. Another reason for low access levels and responses may be due to the fact that there was no student content at the time these units were created. A more content-rich view of tools would be more beneficial, however you then have the issue of privacy of student data to consider. Moodle does have the ability to de-identify students so this could be an option for the next round of example units. The collaborative aspect of using learning objects to contribute to TPD (Handal & Huber, 2011; Taylor, 2003) needs to be further investigated before we can agree with these authors since numbers of respondents who agreed on this aspect were low. In fact 35% actually disagreed that the example units offered opportunities for collaboration.

The open ended question asking what the example units had enabled staff to do that may not have been possible otherwise, produced various comments predominantly around presentation of content and new ideas for use of tools. It will be of interest in the wider study to compare the example units to other supporting resources such as training sessions and self-help guides that were made available during the project implementation.

In line with the developmental evaluative approach to this study, the next phase will include interviews with the unit convenors who designed and then delivered these example units. Questions will be asked about what worked from the original designs and what perhaps didn’t quite go according to plan as they taught these units. What did the students say about the units? A further source of evidence that will be collected is feedback from the educational developers and designers who worked on these example units. For the majority of them, it was also their first interaction with the new LMS and they were trialling ideas around its functionality. Now that their knowledge of the system has developed, their reflections on example unit design will contribute to the next round of development.

Conclusion

Traditionally, professional development in using new technologies for teaching incorporated supporting resources consisting of ‘how-to’ guides and pedagogical reasons ‘why-to’ alongside hands-on face-to-face workshops. Is this adequate for our time-poor academics or is there a more effective and sustainable way to provide such professional development in the future? Improved use of multimedia and functionality of online delivery platforms has contributed to a reconceptualisation of how these supporting resources can be designed and delivered. Since time to invest in TPD is limited with competing workload requirements, teachers require more authentic and proven examples, which can be used as templates in their own design. This study has begun to investigate the affordances of using example units as models of authentic learning design and results to date show positive links to achieving sustainable future teacher professional development.

Appendix A – Sample of questions used in the survey

Likert-scale

1. The content in the example units was authentic.
2. The example units influenced the design of my online unit.
3. My level of understanding (of Moodle) improved by using the example units.
4. I would be inclined to re-visit the example units in future.
5. The supporting resources were adequate when using the example units? (E.g. video, design brief)
6. Example units provide opportunities for collaboration with my peers and/or other staff in using the LMS

Open–ended

1. Comment on the ways in which the example units could better support your learning of Moodle:
2. What have the example units enabled you to do with teaching your course that you wouldn't otherwise have been able to do?

Course Team Symposia: A useful launch pad for exploring course leadership?

Carole Hunter
Charles Sturt University

Course Team Symposia are a funding opportunity provided by Charles Sturt University's Flexible Learning Institute to help course leaders engage their teams in blended and flexible learning design. Initial findings from this preliminary study suggest that course leaders and their educational designers have used the symposium process to 'try out' leadership practices on the job by clarifying and developing a shared vision of blended and flexible learning, supporting collaborative planning, helping their teams reflect on their own practice and forming strategies to improve that practice. In doing so, they are building a repertoire of leadership strategies to use with their teams in the future. Further research involving more symposium recipients will shed additional light on how leadership is being supported through this initiative, and any implications for student outcomes.

Keywords: leadership, course, blended learning, course design

Introduction

> We can only learn about leadership through practising leadership, just as we can only learn how to ride a bicycle by riding a bicycle…This 'learning by doing' within a well-thought-through framework is the only way we can turn the leadership development key and unlock the organization's leadership potential (Peters & Smith, 1998, p.285).

Leadership in higher education is traditionally defined as the 'everyday process of supporting, managing, developing and inspiring academic colleagues' (Ramsden, 1998, p.4). More recently, it's been aligned with managing change (Parrish, 2011), and motivating diverse groups of people to work together to achieve shared outcomes (Fullan & Scott, 2009). Arguably, strong university leadership has never been more important than it is today, with significant global and national changes in the sector forcing universities to rethink their purpose while, at the same time, deal with a leadership succession challenge prompted by the impending retirement of its baby boomer senior managers. Such challenges have understandably prompted an increase in research on academic leadership in recent years (Scott, Coates & Anderson, 2008; Fullan & Scott, 2009; Parrish, 2011) as universities struggle to ensure they are well equipped to re-vision their place in the community in this climate of change.

One leadership role that remains surprisingly under-researched given its significance in terms of course quality and learning outcomes is that of the course leader. Indeed, course leaders are a core asset to universities (Balogun, 2003, in Vilkinas & Ladyshewsky, 2012), directly influencing curriculum change and ensuring that courses remain effective and relevant to a broader and more discriminating student cohort used to a world of ubiquitous knowledge and open educational resources.

Yet despite such key responsibilities, the role of the Australian course leader is often ill-defined, involving an eclectic mix of curriculum design, managing complex academic and professional teams, staff mentoring, marketing, quality assurance, pastoral care and administration (Krause, Scott, Campbell, Spencer, Lizzio, Bath, Fyffe & Clark, 2010). Individual leaders show little similarity in the significance they place on each responsibility, and universities typically do little to support the development of those taking on these roles, instead leaving this to *ad hoc*, on-the-job training and generic leadership programs (Inman, 2009). It's hardly surprising then, that many course leaders see their work as being like 'a small fish in a largely cloudy pond' or like 'rowing without an oar' (Scott et al., 2008, p.50).

Scott et al. (2008) suggest that current approaches to leadership development need to be 'radically reconceptualised' (p. xvii) and mirror established approaches for engaging students. Burgoyne, Mackness & Wiliams (2009) found that development approaches are most effective when conducted in a contextually appropriate way that involves authentic learning activities and opportunities for leaders to 'try out' leadership practices on the job. Similarly, Burgoyne et al. (2009) found that emerging leaders find coaching and mentoring to be particularly effective in supporting their development as leaders. These points are echoed by Scott et al.

(2008), who add that conversations about work with people in similar roles, participating in peer networks both within and beyond the university, and studying real-life workplace problems all have a medium level of influence on effective leadership development.

Course Team Symposia – a conceptual framework

Course Team Symposia are a funding opportunity provided by Charles Sturt University's Flexible Learning Institute (FLI) to help Course Directors engage their teams in Blended and Flexible Learning (BFL) design. The symposia were conceptualised in 2010 as a response to two key drivers. Firstly, the Faculty Deans requested that FLI's current approach to supporting staff through individual Teaching Fellowships (Keppell, O'Dwyer, Lyon & Childs, 2010) be expanded to engage a broader base of staff in BFL design. Secondly, in 2011 the University began its implementation of the CSUDegree (CSU, 2012), which moved curriculum renewal away from an autonomous, subject-based focus to one that was more collaborative, holistic and future-orientated, focused at the course level. Through the CSUDegree, the University made a series of commitments to its undergraduate students to provide opportunities for them to develop in-depth discipline, professional and personal skills, including learning effectively in online environments.

The CSUDegree presented challenging demands for course teams, many of whom had not worked collaboratively on course design in the past. Course leadership was also being reconceptualised, moving away from Course Coordinators who focused on administrative tasks, to Course Directors who would focus on strategic leadership, planning and curriculum development (CSU, 2010). By 2011, most Course Directors were still feeling their way in their new roles, some adjusting quickly supported by strong backgrounds in curriculum development, others finding the right vision but being limited by overwhelming administrative responsibilities, with a small number locked into a less collaborative model of curriculum design. Similarly, some educational designers were taking on informal leadership roles, while others sat outside the renewal process.

The FLI saw the symposia as a way to respond to these drivers. A total of 21 course teams in 12 symposia were supported during the 2010-2012 period (FLI, 2012) through a small financial grant as well as planning, resource and strategic support before, during and after the symposium. The financial grant allowed the Course Directors to bring their multi-campus teams together to collaboratively engage in course design through a focus on BFL. Through forming a draft course strategy, they also provided an opportunity for Course Directors to build leadership experience in their own, authentic context, supported by mentoring from a FLI staff member.

This preliminary case study formed part of a larger research project between Charles Sturt University and Massey University designed to explore learning leadership (Childs, Brown, Keppell, Nicholas, Hunter & Hard, in press). It aimed to explore how course leaders were thinking about and refining their leadership role through the symposium process.

Method

The study used mixed methodology, including analysis of websites and documents emerging from the symposia, as well as a questionnaire and focus groups involving course leaders and educational designers from the initial round of offers. This was important, given the very limited number of symposia (n=4) available to be analysed at the time of writing. All participants (n=8) taking on a leadership role in the first four course team symposia were informed of and invited to participate in the study. The chosen data collection methods included:

- analysis of documents emerging from the symposia, as well as relevant and publicly available websites,
- a questionnaire (n=4) completed by course leaders (n=2) and educational designers (n=2) involved in the first four symposia undertaken as part of the initiative, and
- a focus group comprising questionnaire respondents was conducted to probe, clarify or extend responses from the participants. It was held via teleconference and utilised semi-structured questions to guide the facilitated discussion. The recording was transcribed and analysed for emerging themes. Participants were assigned a code based on their role in the symposium (e.g. CD1, ED1) to ensure anonymity in reporting.

As a preliminary study, this method is limited by the small number of participants, the exclusion of symposium recipients other than course leaders and educational designers (resulting in perceptions of leadership coming only from the leaders themselves), and limited time between the symposium and the focus group, making it difficult to make any longer term assessments of whether each symposium assisted in leadership development. A more extensive longitudinal study is currently in progress.

Findings and discussion

Perception of selves as learning leaders

Each participant expressed an individual leadership style, ranging from being the principle leader (CD1), to leading ‘from behind’ (CD3), collaborating with others in the team who had specific learning expertise (CD2), and a more facilitative role, ensuring that things ‘get done’ (ED1). These reflect depictions of leader roles in the literature, and show a balance between the empathetic management of ‘people’ and the more developmental side of leadership and managing change.

The participants saw leadership as a natural part of their designated role, and felt particularly comfortable with models of leadership that inspire others toward a shared course vision, and which involve creating a comfortable environment in which to identify opportunities for, and facilitate, change. Three of the four questionnaire respondents deliberately set out to inspire or influence others through the symposium, and this seems to have had some initial success, with each respondent impacting on the teaching of between 1 and 4 other academics.

The participants agreed that the symposium had clarified their role rather than changed it. Responses suggest that they were using it to ‘listen’ to others and ‘link’ (Fullan & Scott, 2009) strategies employed to how they might lead curriculum change in other courses:

> It enhanced my role as a leader but I consider it more of a learning experience...What the symposium has empowered me with is the right approach...I didn't have the capacity to, I didn't have the right words if you want, to help these people in the course meeting before the FLI symposium. I wouldn't have known how to approach them without, sort of, hurting a few feelings. I'm more comfortable now having live examples of what we could do...it doesn't have to be dramatic changes it can be incremental changes. It's much better to look at where we want to get as a course, and slowly work towards that. That's been a great experience for me. (CD2)

All questionnaire respondents felt that the perception of themselves as learning leaders had strengthened as a result of the symposium, with perhaps the strongest response coming from the educational designer:

> I feel that my role was strengthened purely through actually having a path to follow. I feel like before we did the symposium there was a lot of talk about incorporating the CSUDI into courses ...but it always got stuck for me as to the how, the when and why we are doing it...the symposium clarified for the course what we wanted to do, why we wanted to do it and when we wanted to have it done by...before we'd done the symposium someone might come to speak to me about BFL but they wouldn't really have a holistic concept of what it was so it made it really difficult for me to suggest the kind of things that they wanted (ED1).

Misconceptions about BFL

A particularly strong theme emerging from the focus group was the benefit of the symposium in providing clarity and addressing misconceptions about their own understanding of blended and flexible learning.

> For a long time I thought that BFL was synonymous with more electronics in teaching...It was when we got together...that a switch went on and (I realised that) this BFL is actually a learning strategy...(CD2)

The leaders felt that the Symposium had helped them develop a clearer vision and engagement in BFL design with their teams, indicated by Fullan & Scott (2009) as critical factors in successful turnaround leadership. Some participants also commented that they had helped them reverse a feeling of disempowerment amongst their colleagues by affirming that many of their current strategies reflected good practice, and were a solid platform from which to build a more consistent and integrated course approach.

Opportunities to develop teams

For half of the questionnaire respondents, this was the first course-level planning meeting that they had attended at CSU. The symposium offered a ‘launch pad’ from which they could establish strong course team relationships and processes, which were later built on as each course leader worked independently with their teams. Here, a Course Director comments on how the symposium helped him move from ineffective processes:

> We have a regular monthly discipline meeting...and sometimes we just don't get anything achieved...One of the consequences of the BFL symposium was that I've come up with a structure for four course teams potentially five course teams within our discipline group...one of the things I wanted to do was to test it out and it worked well I think ... I was impressed. (CD1)

Similarly, other course leaders spoke of the symposium as enabling academics to feel more comfortable in being transparent as individual lecturers and looking at each other's subjects. Each agreed that this was an incremental process, and a learning curve for all involved.

The course symposia, by nature, encouraged academics to reflect as a team on their current practice, particular challenges that were being faced, and possible design solutions to those challenges. The importance of this 'space' for reflection is demonstrated through the following comment:

> We are pulled into a cycle of activities that does not allow for reflective practice. We used the BFL symposium as a reflective period of time, otherwise we just wouldn't dedicate that time to it … I had the opportunity to reflect on it further because I had to put the document together. That was very good … I was forced to have a period of reflective practice, which I wouldn't normally have. (CD2)

Conclusion

Given the significance of the course leadership role, especially in our current climate of rapid change, institutions need to explore a range of approaches to supporting course leaders' personal learning about their role. Although one-off course team symposia can never provide all that course team leaders require to lead innovative course design, nevertheless they do provide valuable and much needed launch pads for trying out a range of leadership strategies 'on the job' that can then be refined and transferred for use with other course teams.

The initial findings from this study suggest that participants have used the symposium process to clarify their conceptions of blended and flexible learning, develop a shared vision, find ways to support collaborative planning within their teams, and reflect on their own practice and changes that need to be made to improve that practice. In doing so, the participants seem to be building on their repertoire of leadership strategies that they can take forward to use with their teams in the future.

Course team symposia are thus a valuable addition to the personal learning opportunities offered by institutions to those undertaking this important role. Used in conjunction with other contextually appropriate, authentic strategies, they may be able to help reverse Inman's (2009) finding that universities do little to support the development of our course leaders.

Further research currently in progress involving additional symposium recipients will shed more light on how leadership is being supported through the symposia process, and any implications for student outcomes arising from this initiative.

Unsupervised Online Constructed-Response Tests: Maximising Student Learning and Results Integrity

Genevieve Johnson
School of Education
Curtin University

Sharon Davies
School of Education
Curtin University

This paper reports a case study in which the Blackboard essay test tool was used to evaluate e-student learning. To promote student learning as well as maintain the integrity of test results, constructed-response items were randomly selected from a large pool of study questions and the time available to complete the tests was limited. The e-lecturer maintained a reflective journal and the e-students were invited, via email, to provide feedback on their perception of the value of the testing approach used in their e-class. Overall, students evaluated the use of the online tests positively, although issues of technology difficulties presented challenges for some students. The e-lecturer was particularly positive about the benefits of such as approach to online assessment citing ease of test management including student test submission, provision of feedback and grading. Unsupervised online constructed-response tests have the potential to enhance student learning while providing valid test scores.

Keywords: Online testing; online examinations; internet tests; unsupervised tests; e-assessment

Assessment in Undergraduate Education

In educational contexts, *assessment* refers to any processes that appraise a student's knowledge, understanding, abilities or skills (Marriott, 2009). Commonly, assessment is dichotomized as formative (i.e., informs the processes of teaching and learning) or summative (i.e., provides a summary of extent or degree of student learning; Bennett, 2011). In undergraduate university education, summative assessment includes, most typically, student performance on examinations (Barhi, 2011). Traditionally and currently, university examinations are tightly controlled to ensure that students' final grades accurately reflect their level of knowledge and skills. Such control is characteristically associated with proctoring or supervision during student completion of examinations.

Summative assessment may include test items in which students select a response from alternatives provided (e.g., multiple-choice, true-false and matching terms with definitions) and/or constructed-response test items which require written responses (e.g., fill-in-the-blank, short-answer and essay questions; Kuechler & Simkin, 2010). Both selected-response and constructed-response test items have advantages and disadvantages. Selected-response test items are easily marked but may not fully assess complex skills such as analysis, synthesis, evaluation and application of knowledge (Yonker 2011). In contrast, marking constructed-response tests is time consuming and scores may vary across markers. However, well-crafted test items and detailed scoring criteria improve the validly and reliability of constructed-response test scores (Livingston, 2009).

E-learning is a fundamental aspect of university education (Allen & Seaman, 2011) and essential to many forms of professional training (Nerguizian, Mhiri, & Saad, 2011). Learning online requires summative assessment which may include tests and examinations (Marriott, 2009). One challenge in e-assessment is the maintenance of academic integrity. The possibility of cheating is the most common reason that professionals hesitate to implement online testing (Chapman & Webster, 2003; Tippins, 2009). However, several studies have concluded that cheating on unsupervised online tests may not be as pervasive as assumed (Arthur, Glaze,Villado, &Taylor, 2009; Nye, Do, Drasgow, & Fine, 2008). Having controlled for student grade point average, Hollister and Berenson (2009) found no significant differences in average performance when online examinations were administered in a proctored environment (i.e., in class) versus an unproctored environment (i.e., offsite). In defense of e-tests, Drasgow, Nye, Jing and Tay (2009) argued that cheating also occurs during supervised examinations and that multiple forms of tests are particularly useful in minimizing student dishonesty in both online and traditional learning environments.

E-assessment research is increasingly common due to the changing nature of higher education and expectations for e-assessment practice (Nicol 2007). According to Oblinger (2006), contemporary university students reflect a broad background of technology use both at home and school. Students expect interaction, a visual experience and rapid feedback from their learning activities. Wilkinson and Rai (2009) noted that many universities use computers for online formative assessment, but “application of computers to the summative assessment arena are much more limited” (p. 368). When summative e-testing is used, it is typically restricted to selected-response items, perhaps due to the benefits of automatic marking (Lin & Dwyer, 2006). Whitelock (2009) argued for fairness in online tests and the need for systematic investigation of e-assessment and student e-learning. For example, in comparing the effects of a variety of e-test formats, Johnson (2006) reported that “short answer and true-false online quiz items were differentially associated with measures of academic achievement, suggesting that cognitive processing differed across item format” (p. 105). Marriott (2009) concluded that “e-assessment offers opportunities for creating innovative assessment practices that help engage students and increase their motivation for learning” (p. 237).

Applied Research Focus

Blackboard testing options may be applied to maintain student academic integrity while promoting student learning outcomes. The Blackboard test tool allows for random selection of test questions from a large pool of potential items. As well, enforcing time limits, easily implemented in Blackboard, may encourage students to develop effective learning strategies. This paper reports a case study in which the Blackboard essay test tool was the only sources of summative assessment in a fully-online course.

An E-Learning Case Study

Via Blackboard, all students enrolled (n=23) in a fully-online first year educational psychology course were required to complete three unsupervised constructed-response tests using the Blackboard LMS. The course was organized into weekly learning modules. Each module included an *Elluminate Live* session, required readings, online discussion and learning activities. Each module contained several study questions which helped students focused their learning efforts. Students were informed that all tests items would be taken directly from the study questions. Figure 1 provides a screenshot of the study question organized in learning modules in Blackboard.

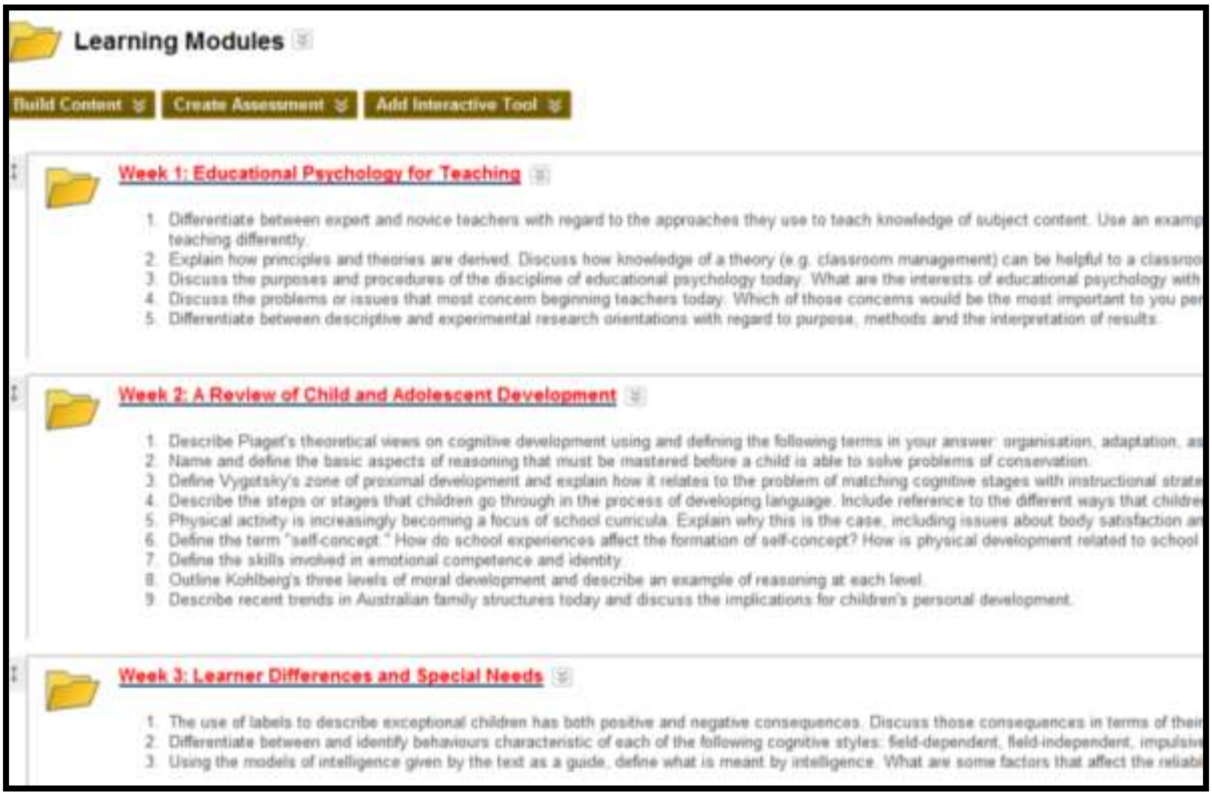

Figure 1: Weekly Study Questions Organized in Blackboard Learning Modules

Students completed the three unsupervised constructed-response tests via the Blackboard test tool. Test items were randomly drawn for a subset of study questions corresponding with the learning content covered during specified instructional weeks. The amount of time that students had to complete the online tests was reduced across the three assessments. Such reduction allowed for determination of student response to time limits in e-testing. Students were not required but simply informed that preparing written responses to all study questions would facilitate their timely completion of each online test. That is, regardless of the specific items randomly generated by the Blackboard test tool or the number of days students had to complete the test, students would be able to simply copy and paste their completed responses into the response space provided in Blackboard. Research findings suggest the student learning is maximized by careful and thorough written response to study questions (Papadopoulos, Demetriadis, Stamelos, & Tsoukalas, 2010). Figure 2 provides a screen shot of the Blackboard essay test interface.

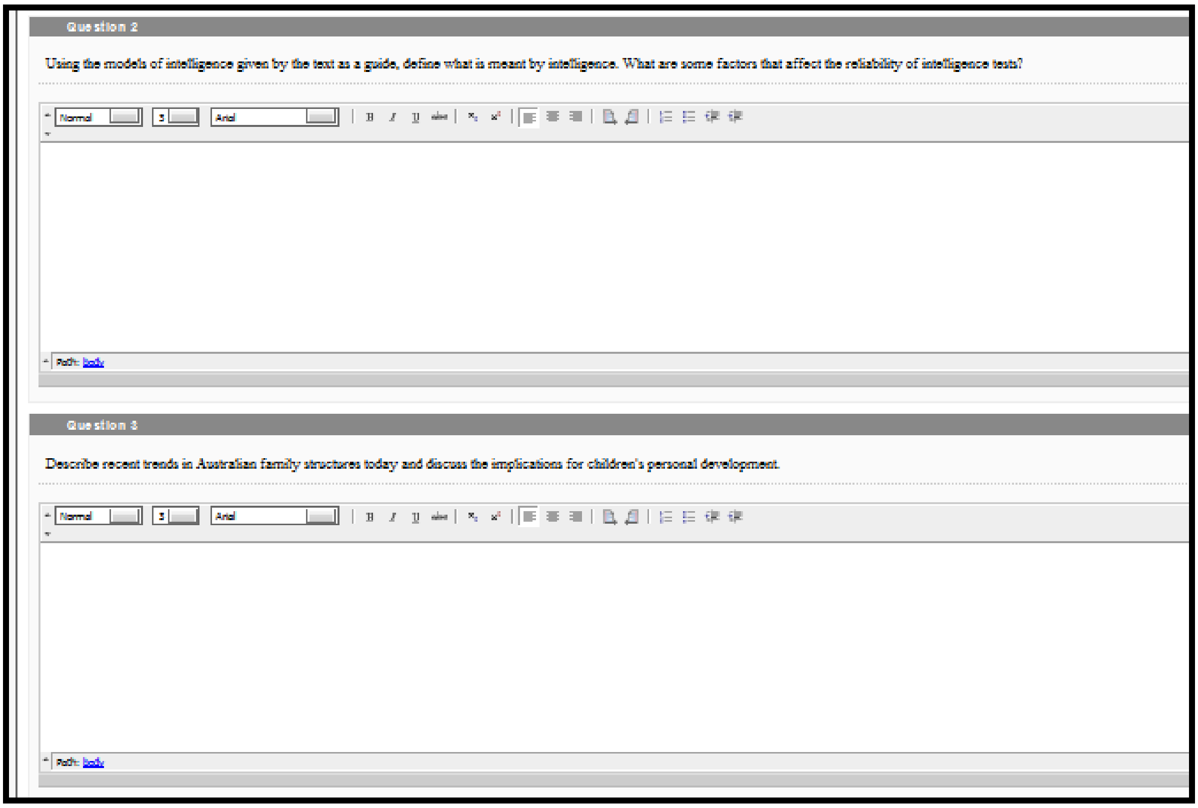

Figure 2: Blackboard Essay Test Interface

The following information summarized instructions to students with respect to each of the three required constructed-response e-tests and appeared on the course outline and in Blackboard:

> Each Learning Module (i.e., weekly Elluminate Session, Blackboard learning events and corresponding textbook chapter/s) includes study questions that are posted in Blackboard in LEARNING MODULES. On the dates specified below, a subset of study questions will be available via the Blackboard link STUDY QUESTIONS ASSESSMENTS. You will have the opportunity to answer these selected questions for a limited amount of time. There is a practice set of study questions so that you can ensure that you feel comfortable with the submission processes and that your technology is functioning. Scoring criteria is available in Blackboard and will be discussed in detail during the Elluminate sessions.
> *Study Questions # 1* (value = 30%) assess your understanding of material presented during the first four weeks of class (Learning Modules 1 through 4 which includes textbook chapters 1 through 5). The STUDY QUESTIONS ASSESSMENT will be available from August 9th until August 15th. Students have exactly seven days to complete and submit their responses to the randomly generated five questions drawn from all the study questions associated with the specified learning modules.

Study Questions # 2 (value = 30%) assess your understanding of material presented during the fifth, sixth and seventh weeks of class (Learning Modules 5 through 7 which includes textbook chapters 6 through 9). The STUDY QUESTIONS ASSESSMENT will be available from September 2nd until September 5th. Students have exactly four days to complete and submit their responses to the randomly generated five questions drawn from all the study questions associated with the specified learning modules.
Study Questions # 3 (value = 40%) assess your understanding of all material presented during all weeks of class (Learning Modules 1 through 12 which includes textbook chapters 1 through 14). The STUDY QUESTIONS ASSESSMENT will be available from October 9th until October 10th. Students have exactly two days to complete and submit their responses to the randomly generated eight questions drawn from all the study questions associated with the specified learning modules.

Students submitted their written test responses via the Blackboard test tool which were then marked by the e-lecturer. Marking criteria, posted in Blackboard and discusses in detail during the weekly *Elluminate Live* sessions, evaluated each constructed response in terms of 1) concise statements (every word necessary), language usage (spelling, grammar, sentence structure), paraphrase (avoid copying from the textbook), terminology usage (appropriate vocabulary), analysis (explore the topic in depth) and proper referencing (adherence to APA format). Figure 3 provides a screenshot of the Blackboard essay test feedback interface. Marks automatically populated *Blackboard My Grades*.

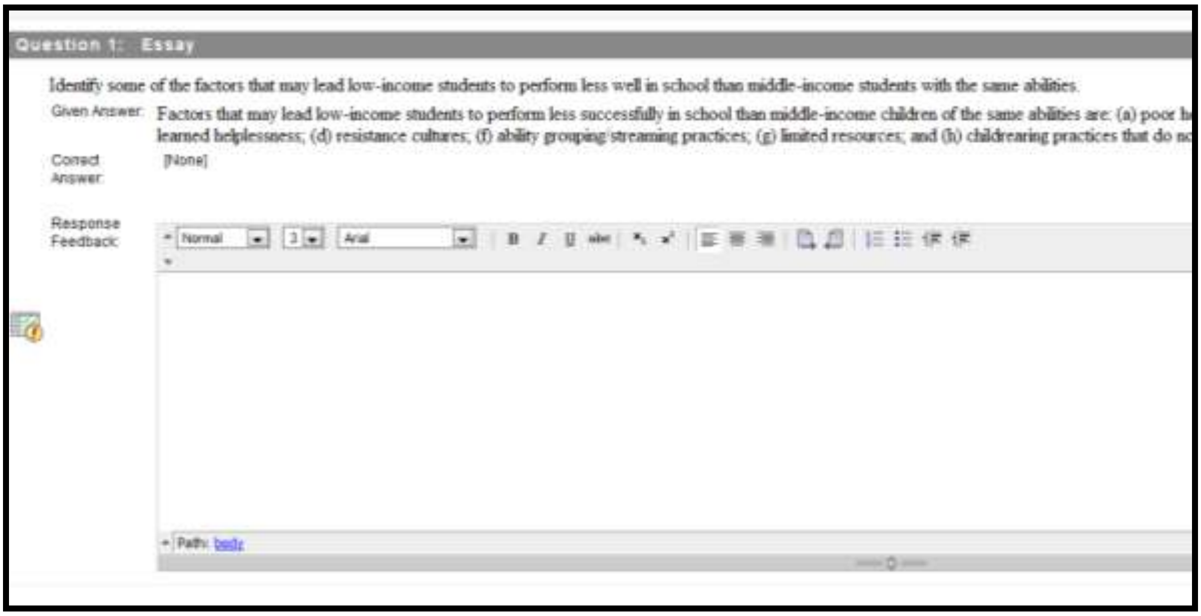

Figure 3: Blackboard Essay Test Marking Interface

E-Learning Case Study Evaluation

Throughout the academic semester, the e-lecturer engaged in professional reflective journaling with respect to experiences with students, the technology and marking the constructed-response test items in Blackboard. During the 15 week semester and until all final marks were submitted, the e-lecturer made ten journal entries. Entries varied from several words (e.g., marking is the worst part of teaching) to several sentences which made reference to email conversations with students and student comments and queries during weekly *Elluminate Live* sessions. Professional reflective journal entries were organized and analysed in terms of themes. Some journal entries included multiple statements and sentiments and, thus, multiple themes.

Following marking of all online tests and the posting of the final grades in *Blackboard*, all students who remained enrolled in the educational psychology e-class (n = 21) were invited, via email, to provide feedback on their experiences with the essay online tests. As required by research ethics, students were reminded that their response to the questions was entirely voluntary and that, if they chose to respond, the confidentially of their identity was guaranteed. Students gave permission for their responses to be directly quoted for research purposes and without connection to any identifying information. All students who responded to the email survey indicated that their message could be used for research. The questions in the email included:

1. How did you feel about the Blackboard essay test format?
2. Did you encounter any technical problems with the Blackboard essay test tool?
3. Where there any advantages to you using the Blackboard essay test tool to complete your assessments?
4. For the first assessment, the test tool was available for one week. For the second assessment, the test tool was available for four days. For the final assessment, the test tool was available for two days. How did this affect your approach to the assessments? Where there differences in how your approached each assessment because of the allocated time differences?
5. Can you suggest any improvements in using the Blackboard essay test tool in the future?

E-Student and E-Lecturer Feedback on the Online Essay Tests

Approximately half of the students invited to provide feedback on their experiences with the essay online tests responded to the email, although some students did not answer all five questions and some students simply wrote general comments all of which reflected satisfaction with the online tests and the course in general. Several students did provided detailed and considered written response to the email survey questions. Representational student comments are presented in Table 1. As can be seen, students varied in their perceptions and interpretations of the value of the Blackboard essay test tool. Approximately half of students who responded to email survey item #2 claimed that they experienced technical difficulties while approximately half reported that the technology worked well. Although home-based internet access is virtually universal among Australian first-year university students (Johnson & Broadley, 2011), the quality of connectivity and hardware and student comfort and ease of computer use may vary. Additionally, there was a high level of student satisfaction with the course and the e-lecturer and, perhaps, positive evaluation may have generalized to the use of the Blackboard essay test tool. Approximately 40% of the students who responded to email survey item #4 stated that they had answered all the study questions. Two students expressed the perception that the Blackboard essay test tool was more useful for the teacher than for the students. Such students expressed preference for simply submitting a text document via email, although such an approach would not have allowed for random generation of constructed-response items from specified study questions.

The e-lecturer reflective journal entries were extremely positive with respect to the students, the technology and marking the constructed-response test items in Blackboard. The e-lecturer was particularly positive about the benefits of online assessment citing ease of test management including test submission, provision of feedback and grading. Table 2 provides summative analysis of e-lecturer journal entries organized into themes. Four themes were evident from the ten professional reflective journal entries including issues related to: 1) managing students, materials and learning events online; 2) marking the constructed-response online tests; 3) professional satisfaction with specific aspects of teaching online and 4) frustration which focused primarily of marking and email from students which suggested lack of effort (e.g., failing to reading information available in Blackboard).

Integrity of student tests results was not an issue. E-student responses to the email survey and the e-lecturer reflective journal entries did not provide evidence that constructed- responses were copied or were not the work of the student who logged on to Blackboard and submitted the completed test. This may be the consequence of the testing protocol used. That is, while students did not know the specific items that would appear on each of the three online essay tests, they knew that the items would be drawn from the learning module study questions posted in Blackboard. Additionally, participating students did not need to cheat since, with sufficient preparation, they could simply copy and paste constructed-responses from previously answered study questions. Alternatively, although time was restricted, the number of items in each online test was sufficient to generate constructed-responses because students had access to their learning materials. The approach to e-learning and e-assessment reflected in the case study investigation did not require students to memorize course content. Requiring students to memorize large amount of information may spawn academic dishonesty.

Table 1: Representational Student Feedback on the Online Essay Tests

Question	Representational Student Response to Question
How did you feel about the Blackboard Essay test format?	It was a little cumbersome as it was not as easy to use as Microsoft Word, so cut and paste was required to transfer answers from Word to Blackboard. Proof reading and editing was much simpler using Word and at times while researching information for the answers, I would start editing in Blackboard, then realise I should have done it in Word, or make some changes in Word and some in Blackboard, becoming totally confused. My results showed that I did very well responding to the questions, however I found the number of questions asked was very small, in comparison to the 81 or so questions that required preparation. (Only approx 21% of content was actually tested - is this normal?) I did enjoy using this format, and the limited word count for the questions really allowed me to study and condense my knowledge, by getting to the point, rather than writing a lot of superfluous information.
Did you encounter any technical problems with the Blackboard Essay test tool?	No, the technology worked well and no problems were experienced. I had MANY instances of technical difficulties loading the questions...I found this nerve wrecking...Also, the fact I did not know how long I had to load the questions - before the system timed out, caused anxiousness.
Where there any advantages to you using the Blackboard Essay test tool to complete your assessments?	I can't think of any advantages from a student's perspective, however from a lecturer's perspective the timed aspect may have been useful. This, however could also be achieved through issuing questions with a specific time limit for submission. Using the blackboard essay test tool allowed me to plan my study, work, family and personal commitments around the scheduled testing periods. There was ample time available to load the questions.
For the first assessment, the test tool was available for one week. For the second assessment … How did this affect your approach to the assessments? Where there differences in how your approached each assessment because of the allocated time …?	This did not affect my approach to the assessments, as once started, the assessment had to be completed. Thus the amount of time available was irrelevant, apart from coordinating a specific time within the timeframe to complete the assessment. If we were able to access the questions for the whole period of time the assessment was available, I may have approached the assessment differently each time. For example, I would have been tempted to wait until the assessment was available before completing the questions for the longer timeframes, rather than completing the questions on a weekly basis The three different timetable schedules worked for me. If I was doing this unit on-campus, exams would be on a certain date at a certain time, therefore this unit's format had ample flexibility. I had all my questions pre-prepared on a word document so it only required a few minutes to load the questions – except for the 'saving' technical difficulties I experienced. Ultimately, it's all about organisation and preparation – and this unit supported this opportunity by providing a workable schedule in the beginning of the unit.
Can you suggest any improvements in using the Blackboard Essay test tool in the future?	I am unsure of Blackboard's suitability for essay writing. It is much more cumbersome than using Word. The window for writing is quite small and copying and pasting from Word leaves a margin for error, for example, in one question I accidentally left out references. I have found Blackboard very good for quizzes, but submission of essays using Microsoft Word only is a much simpler process. All aspects of this unit were exemplary and I thoroughly enjoyed the format. I especially felt supported by the materials used, and thought the textbook was great and easy to understand. I particularly enjoyed Elluminate, and felt all these learning tools provided me with the best opportunity to provide 'deep' answers to the questions asked in the Blackboard essay testing tool.

Table 2: Thematic Analysis of E-Lecturer Reflective Journal Entries

Theme	Representational E-Lecturer Reflective Journal Entry
Management	I remember the old days of submissions apparently disappearing into cyberspace. This is better. Even though BB is a bit of a dinosaur, it is nice to have all aspects of the course organized and assessable in one central location.
Marking	I just love the essay interface. I made some cut-&- pastes so was able to reuse some comments. Gosh it is nice to save a branch or two. Paper is the devil.
Satisfaction	I like teaching online. The students seem more appreciative and motivated, not like my f2f classes, grrr
Frustration	Not sure what's up but several students claim their PC hiccupped and they could not get back into the test. I give them a choice, I can reset and they start again, I can email a random set of questions which they can return. Not good. What if I had a huge class??

Implications for E-Assessment and Future Research

Assessment is an essential component of learning processes. It is, therefore, not surprising that virtually all learning management systems offer assessment tools, particularly for the creation, execution and evaluation of selected-response or multiple-choice tests (Amelung, Krieger, & Rosner, 2011). Yate and Beaudrie (2009) concluded "that evaluating students through the exclusive use of online assessment is a reasonable approach that results in grades that do not differ from measuring student progress with exams that are given under proctored conditions" (p. 69). Results of the current case study investigation, although limited in scope and application, provide support for the viability and utility of exclusive use of unsupervised online constructed-response tests in fully-online learning environments. Most e-students and the e-lecturer strongly supported use of the Blackboard essay test tool as the only mechanism of assessment. No e-student objected to online constructed-response tests, although not all saw advantages over simply emailing documents to the e-lecturer. From the e-lecturer's perspective, however, large numbers of students negate the possibility of such a submission strategy. As well, email does not necessarily provide evidence of student submission or the basic timing functionality of online test programs.

One of the potential advantages of e-assessment is automation of marking (Lin & Dwyer, 2006). This is particularly true with selected-response items (Amelung et al., 2011; Johnson, 2006), although exclusive use of selected-response may not maximize student mastery of required learning and skills such as written composition. Increasingly, programs are emerging that automatically mark constructed-response test items. For example, Jordon and Mitchell (2009) implemented a natural language system to mark short-answer test items. Students were automatically given tailored and detailed feedback on incorrect and incomplete responses. Reportedly, "a small number of the questions are now in low-stakes summative use, alongside other e-assessment tasks and tutor-marked assignments, to give students instantaneous feedback on constructed response items, to help them to monitor their progress and to encourage dialogue with their tutor" (p. 371). As natural language software continues to improve, applications to marking constructed-response e-assessment will correspondingly continue to improve. Students' interpretation and perception of machined-marked written composition requires further investigation.

Some, but not all, students in the current case study investigation prepared responses to all study questions associated with each weekly learning module in Blackboard. Reported benefits associated with written responses to questions include increased levels of student reading comprehension, retention of information, use of cognitive strategies, motivation, satisfaction, communication, interaction and problem-solving (Abramovich & Cho, 2006; Barlow & Cates, 2006; Yu & Liu, 2009). Menary (2007) concluded that "creating and manipulating written sentences are not merely outputs from neural processes but, just as crucially, they shape the cycle of processing that constitutes a mental act" (p. 622). The actual process of writing can be used effectively as a tool for supporting students in developing critical thinking and increasing their analysis, inference and evaluation skills (Quitadamo & Kurtz 2007). Strategies directed at ensuring that all students construct responses to all study questions might be developed, implemented and evaluated. Although systematic investigation is required, one possibility is extreme restriction of online essay test availability.

E-assessment has stimulated change in assessment practices in higher education and is likely to play an increasingly important role in the future (Whitelock & Watt 2008). Stödberga (2011) conducted a comprehensive review of current e-assessment research and concluded “that the body of knowledge in the field is extensive enough to provide a sound basis for general guidelines” (p. 12). In considering the relationship between human cognition and the evolution of tools, the need for rote memorization may be decreasing as digital technology allows for easy storage of large amounts of information and mechanisms to quickly retrieve that information as needed to solve immediate and specific problems (Johnson, 2008). Movement away from rote memorization in university education will likely increased student academic integrity. Manipulating time-constraints, easily achieved with learning management systems, may encourage student learning (e.g., answering all study questions in advance) thereby reducing incidences of dishonesty during testing. Whitelock (2010) argued for a new focus on e-assessment driven by pedagogy rather than technology.

Online learning in ACSEducation: Using online learning tools in professional education

Asheley Jones
ACSEducation
Australian Computer Society

Charlynn Miller
School of Science, Information Technology & Engineering
University of Ballarat

Following the theme of "Learning for the Future", this paper investigates the use of a number of online tools that enhance learning within the Professional Year Program offered by ACSEducation. Supported by the literature on the use of these tools for learning and assessment, the use of online tools has provided engaging and relevant learning for students undertaking ACS programs. This paper explains the choice of tools and how they are applied to ensure the best outcome for the learners. Current research being undertaken to investigate the perceptions of students toward the use of these tools is discussed. Future research into the improvement in the use and efficacy of the tools into the future, and the methods planned for this research is also detailed along with relevant supporting literature.

Keywords: ACS, Moodle, Mahara, e-Portfolio, online learning, online assessment, professional education

Introduction and background

This paper details and discusses the use of online learning tools within the Professional Year Program at ACSEducation, a subsidiary of the Australian Computer Society (ACS). ACSEducation uses a number of online, open source tools to deliver educational programs for ICT professionals. Using a variety of well-researched online learning tools has enabled the ACS to engage and advance the skills of ICT professionals in programs across the industry association. This paper will discuss several of the online tools used within one program and plans to formally evaluate the efficacy of such tools as the ACS plans and expands its educational program into the future. Following the theme of "Learning for the Future", this paper will highlight the advantages of the use of such tools within ACS programs into the future.

Australian Computer Society, ACSEducation & the Professional Year program

Underpinned by an Outcomes Based Education (OBE) model that promotes a constructivist approach to reflective learning, ACSEducation provides several on-line, open source e-learning environments within which IT practitioners at all levels may study to enhance their own particular skill sets with a view to seeking professional certification.

In a report commissioned by the Federal Government, three factors were identified as contributing to only one third of Australian trained, overseas born graduates obtaining employment within the Australian workplace: lack of specific occupational work experience; a viable Australian labour market bridging program; and weak English skills (Birrell, Hawthorne and Richardson, 2006). The development of the ACS Professional Year Program was recommended as a way in which to equip migrant workers with a variety of predetermined work readiness skills. Previous research had shown that the poor English language and communications skills were key areas of deficiency (Bretag, 2007; Watty, 2007). Professional Year Programs were designed to equip language challenged graduates with the generic skills required to work effectively within the Australian workplace (Birrell, et al., 2006). The PY 44 week work readiness program developed by the ACS offers a twelve week component whereby the PY student is enrolled simultaneously in an ICT internship and an online tutorial and it is this element of the program on which this paper concentrates.

A review of relevant literature conducted for this paper identifies previous work that supports the use of the online learning tools employed by ACS Education as well as informs the methods used in current and planned research in this area. The literature review selection criteria concentrates on an analysis of the efficacy of online learning delivery, the pedagogical underpinning for such educational delivery as well as the types of methodologies used to support on-line, open source learning environments within varying levels of educational delivery. A second objective was to identify the types of gaps evident within the literature review conducted. A brief review of the most relevant literature is presented here.

Increasingly, universities are incorporating online technologies into teaching and learning strategies with the aim of creating more flexible learning activities (Taylor and Eustis, 2002). Advancements in information and communication technologies (ICT), as well as the changing needs and demands of students, are profoundly influencing instructional formats and delivery modes of tertiary educational institutions worldwide. Some acknowledged benefits of online learning delivery in this field include: enhancement of marketability; maximization of students' choice of learning styles; location; time; place of learning; reduction in instruction time; enhancement of effectiveness and mastery of learning; potential improvements in retention; increases in student motivation; satisfaction; and enjoyment of the learning experience (Farrell and McGrath, 2001; Kenny, 2002).

Recent studies have established that the provision of access to teaching materials alone is unlikely to engage students who respond better to more multi-modal forms of learning and is less likely to result in deeper levels of knowledge and skill development (Prensky, 2006; Rouvrais and Gilliot, 2004). Twenty-first century learning environments clearly need to take into account the networked nature of knowledge, opportunities afforded by teamwork and the importance of participation in knowledge generation in technology-rich environments (van Weert, 2006). Connectivism, (Siemens, 2005) acknowledges the centrality of learning through the generation of ideas, supported by social activity, enabled by personal networks, interactivity and engagement in experiential tasks and viewing the teacher as having the role of a mediator. Learning is the process of creating connections, a view that is congruent with the ways in which people engage in socialisation and interaction in the Web 2.0 world. A key idea is that learning starts with the connections students make with one another, as opposed to engagement with a fixed body of content.

Various researchers, (Birenbaum and Rosenau, 2006; Ashcroft and Hall, 2006) investigated the role of e-portfolios in assessing the development of life long learning skills and continuing professional development. Birenbaum and Rosenau placed reliance in earlier research conducted by Entwistle, (1991), and utilised Biggs' (1996) methodological measuring tool: the Motivated Learning Strategies Questionnaire. Biggs' research identified the importance of student attitudes towards learning and how the identification of attitudinal motivation influences individual student perceptions of the learning environment and its inevitable impact on their ultimate success within these learning environments. Tochel et al's (2009) study findings suggested there is good evidence that if well implemented, portfolios are effective and practical in a number of ways including increasing personal responsibility for learning and supporting professional development. Of further interest is their conclusion that a well-informed mentor can have considerable impact on [e-portfolio] uptake, especially when regular feedback is given. Reflective practice encourages synthesis of not only learning experiences, but also the personal value of other situations, (Conrad and Donaldson, 2011) such as internship experiences.

Over the past twenty years, the Internet has had a profound effect on the teaching and learning practices in higher education programs. Carbonaro, King, Taylor, Satzinger, Snart, and Drummond (2008) found that students reported enjoying the novelty and flexibility afforded by the use of online technologies. Studies suggest that there is a strong movement towards providing online learning as students appreciate the flexibility and enjoyment of learning in this environment (Kenny, 2002; Carbonaro, et al., 2008).

In spite of the plethora of studies on the effectiveness and advantages of online learning, there are several specific gaps in which the authors have planned studies. One is the lack of evaluation of online learning programs within professional industry associations. The other is the minimal amount of research conducted around the effectiveness of online assessment, particularly in online only courses. Finally, there is a gap in perceptions of online students who defer or withdraw from study environments.

ACSEducation application of online learning tools

Given Moodle's wide use in Higher Education delivery, and that education delivery was clearly moving towards e-learning, ACSEducation decided to adopt Moodle for its e-learning system in 2006. ACSEducation works with Bright Cookie, an educational technology company based in South Australia, which hosts the Moodle server and provides maintenance. Another strength that attracted ACS to Moodle was the usability. ACS decided to implement e-learning because of its position as a professional body in the IT sector.

A further open source learning tool utilised within the ACSEducation online environment is that of Mahara, a personalised, professional electronic portfolio (e-portfolio) within which students can document and plan their professional life achievements, career plans and long-term goal objectives.

In addition to offering materials for learning for PY students, Moodle and Mahara are used for all assessment of students in the course. Following a face to face workshop in which students are introduced to Moodle, Mahara, the SFIA (2011) capabilities framework and the PY course itself, student operate completely on line with the assistance of a tutor who interacts, monitors and assesses their progress.

Within the online course itself, students are divided into groups of 15-20 within a Moodle shell. Over the course of 12 weeks, they are introduced to a number of learning objects including a skills framework, ethical decision making, risk management, project management, initial career development information. Assessments include online weekly quizzes, discussion forums, reflective journals, and three assignments. The assignments include analysis of an ICT ethics case study, a risk management report and the development of a career based personal e-Portfolio. Each part of the online course is monitored by an ICT professional providing assistance and advice to the student. Whilst the student is engaged in the PY course, they are also completing a 12-week internship. This provides the student with an opportunity to gain valuable experience in the Australian ICT environment, and to reflect on this experience within the course.

The first tool offered within ACSEducation programs to assist students in an objective, documented self-analysis of their own particular IT skills is the introduction of an internationally recognised skills framework - the Skills Framework for the Information Age (SFIA, 2011) – the structure of which aids participating students in identifying demonstrable, current levels of professional achievement across generic and specialised skills, mapped against specific measurable standards (www.sfia.org.uk).

Current and future research

The authors took on board the recommendation of Bliuc, Ellis, Goodyear, and Piggott (2009) that further extensive research over a wide range of disciplines, involving large samples and a range of instruments to determine the effects of student perceptions in the effects of the online environment on ultimate educational outcomes as the starting point for our research design.

The approach adopted by the authors' current research into student perceptions of how Moodle and Mahara develop deep approaches to learning and the perceived quality of these tools has been influenced by previous qualitative research studies (Baeten, Dochy, and Struyven, 2008; Ellis, Calvo, Levy, and Tan, 2004). Research into the role of Moodle and Mahara as effective digital tools for reflective practice facilitation is reliant on the case study research conducted by Hegarty (2009) and George-Palilonis and Filak (2009). Birenbaum and Rosenau suggested a need to further analyse student perceptions of the online learning environment through the adoption of a mixed-methods research approach.

Since one gap the authors identified within the literature review was the exclusion of student perceptions from those who defer or withdraw from online open source study environments, it was decided to include all identifiable Professional Year (PY) enrollees within the questionnaire survey roll out, rather than merely those currently engaged within the medium or who had successfully completed the subject.

Following the completion of the study detailed above, the authors wish to investigate whether the existing online learning environment is an effective tool for creating a reflective learning environment. Subsequent papers will involve analysis of larger data sets extended to include the perceptions of both students and tutors, with a view to identifying, recording and implementing any remedial actions required to improve positive educational outcomes in the acquisition of professional development certification.

Hegarty's (2009) preliminary case study, which examined the role of reflective writing practices within the development of student skills, is an area of research identified as requiring further investigation. Finally, the authors will explore whether the concept of reflective learning could be easily grasped and self-reported as a positive learning conduit. Does the e-portfolio medium assist in facilitating student-centered learning and an ability to demonstrate a solid understanding and application of the required learning outcomes?

Conclusion

This paper detailed the structure of the ACS Education PY offerings, literature around the use of online learning, assessment and e-Portfolio use, and current research to establish effectiveness of the current environment. Existing research supports future research plans for the introduction of the chosen methodological framework for what is envisaged as a longitudinal study intended to offer further data to supplement current educational literature. The results of the pilot study investigating student perceptions of the role of the online and e-portfolio environment in the ACS Professional Year program will inform this future research.

The life and death of Webfuse: principles for learning and leading into the future

David Jones
Faculty of Education
University of Southern Queensland

Drawing on the 14-year life and death of an integrated online learning environment used by tens of thousands of people, this paper argues that many of the principles and practices underpinning industrial e-learning – the current dominant institutional model – are inappropriate. The paper illustrates how industrial e-learning can limit outcomes of tertiary e-learning and limits the abilities of universities to respond to uncertainty and effectively explore the future of learning. It limits their ability to learn. The paper proposes one alternate set of successfully implemented principles and practices as being more appropriate for institutions seeking to learn for the future and lead in a climate of change.

Keywords: e-learning, LMS, design theory, organizational change

Introduction

In the mid to late 1990s it seemed like most of the early adopters of web-based learning were developing their own "cottage industry" e-learning systems. The design of one such system at CQUniversity was described in a 1996 ascilite paper (Jones & Buchanan, 1996) and implemented in 1997 as Webfuse. Unlike many such cottage systems, Webfuse survived the top-down selection and adoption of a single, enterprise-wide Learning Management System (LMS) in the early 2000s. A practice labeled here as industrial e-learning. While CQUniversity did officially select WebCT (1999) and then Blackboard (2004) as the official institutional LMS, Webfuse was widely used until 2009 and the adoption of Moodle.

During its lifespan work on Webfuse developed a range of innovative and context specific features – many of which are still not available in other systems - that were adopted at significantly greater rates than that of other systems both within and outside CQUniveristy. Some of those features are still in use at the institution in the middle of 2012, even though Webfuse is no longer officially supported. This paper argues that a significant contributing factor to this apparent success is that the principles and practices underpinning the design and support of Webfuse are significantly different than those underpinning industrial e-learning. In particular, these principles better enabled the design and use of Webfuse to learn from prior experience and evolve more rapidly.

This paper draws on this work to demonstrate the source of the limitations of industrial e-learning and to propose that the principles abstracted from Webfuse as offering a more appropriate alternative for tertiary e-learning. The paper starts by briefly explaining the research on which this work is based and summarizing the evidence that suggests it is worth consideration. The paper then examines the source of the limitations of industrial e-learning by analyzing three different components: product, process, and people. For each of these, how industrial e-learning sees each component is described, the problems of these conceptions is illustrated, and the emergent alternative is presented. While not positioned as being without problems or as the only alternative to industrial e-learning, it is suggested that these alternative principles can offer significant advantage to tertiary institutions.

Research method and limitations

From the initial stages of its design the Webfuse system was intended to be a vehicle for both practice (it hosted over 3000 course sites from 1997-2009) and research. Underpinning the evolution of Webfuse was an on-going process of action research that sought to continually improve the system through insights from theory and observation of use. This work has contributed in varying ways to over 25 peer-reviewed publications. Other researchers have also studied Webfuse when investigating institutional adoption of e-learning systems (Danaher, Luck, & McConachie, 2005) and shadow systems in the context of ERP implementation (Behrens, 2009; Behrens & Sedera, 2004). Starting in 2001 the design of Webuse became the focus of a PhD thesis (Jones, 2011) that made two contributions towards understanding e-learning implementation within universities: the Ps Framework (Jones, Vallack, & Fitzgerald-Hood, 2008) and an Information Systems Design Theory (ISDT) titled "*An ISDT for emergent university e-learning systems*". The Ps Framework arose out of an analysis of existing e-learning implementation practices and as a tool to enable the comparison of alternate approaches to e-learning implementation (Jones et al., 2008). The ISDT offers guidance for e-learning implementation that brings a number of proposed advantages over industrial e-learning. This paper draws on the Ps Framework and the ISDT to illustrate the limitations of industrial e-learning and a promising alternative by focusing on three (of the seven) components of the Ps Framework: product, process and people.

The ISDT – and the sub-set of principles presented in this paper - seek to provide theoretical guidance about how to develop and support information systems for university e-learning that are capable of responding to the dominant characteristics (diversity, uncertainty and rapid change) of university e-learning. This is achieved through a combination of product (principles of form and function) and process (principles of implementation) that focus on developing a deep and evolving understanding of the context and use of e-learning. It is this deep and evolving understanding and the ability to make rapid changes to the system, which ultimately encourages and enables adoption and on-going adaptation. The argument is that any instantiation built following the principles of the ISDT will support e-learning in a way that: is specific to the institutional context; results in greater quality, quantity and variety of adoption; and, improves the differentiation and competitive advantage of the host institution.

As with all research, this work has a number of limitations. Through its use of action research, this work suffers the same limitations, to varying degrees, of all action research. Baskerville and Wood-Harper (1996) identify these limitations as: (1) lack of impartiality of the researcher; (2) lack of discipline; (3) mistaken for consulting; and (4) context-dependency leading to difficulty of generalizing findings. These limitations have been addressed within this work through a variety of means including: a history of peer-reviewed publications throughout the project; use of objective data sources; the generation of theory; and, an on-going process of testing. The nature of this research means that the resulting ISDT and the principles described here have not been “proven”. This was not the aim of this work. Instead, the intent was to gather sufficient empirical and theoretical support to build and propose a coherent and useful alternative to industrial e-learning. The question of proof and further testing of the ISDT in similar and different contexts provides – as in all research aiming to generate theory - an avenue for future research.

On the value of Webfuse

This section aims to show that there is some value in considering Webfuse by summarising the empirical support for the ISDT by presenting evidence that the development of Webfuse led to a range of features specific to the institution and to greater levels of adoption of those features. From 1997 through 2005 Webfuse was funded and controlled by one of five faculties at CQUniversity. During the life-span of Webfuse CQU adopted three different official, institutional LMSs: WebCT (1999), Blackboard (2004), and Moodle (2010). In 2005/2006, Webfuse became a system controlled by a central IT division. After this centralization development of Webfuse was restricted by much the same practices – but not entirely - as industrial e-learning.

Specific to the context

During the period from 1999 through 2002 the “Webfuse faculty” saw a significant increase in the complexity of its teaching model including the addition of numerous international campuses situated within capital cities and a doubling in student numbers, primarily through full-fee paying overseas students. By 2002, the “Webfuse faculty” was teaching 30% of all students at the University. Due to the significant increases in complexity of teaching, a range of teaching management and support services were added to Webfuse including: staff and student “portals”, an online assignment submission and management system, a results upload application, an informal review of grade system, a timetable generator, student photo gallery, academic misconduct database, email merge facility, and assignment extension systems. Many of these tools and especially some of the features provided by these tools are not present in other systems, then and now. For example, Rossi and Luck (2011, p. 68) describe some of the differences between the Webfuse and Moodle online assignment management systems.

The value of these tools to the faculty is illustrated by this quote from the Faculty annual report for 2003

> [t]he best thing about teaching and learning in this faculty in 2003 would be the development of technologically progressive academic information systems that provide better service to our students and staff and make our teaching more effective. Webfuse and MyInfocom development has greatly assisted staff to cope with the complexities of delivering courses across a large multi-site operation (Danaher, Luck & McConachie, 2005, p. 39).

Further evidence of the contextual value of these services is that by 2003 the faculties not using Webfuse were actively negotiating for access to the services. By 2009, over 12,000 students and 1100 staff from across the institution made use of these services. Even though Webfuse is no longer officially supported, a few of these services continue to be used by the university into 2012.

Quotes from staff using the Webfuse systems reported in various publications also provide some insights into how well Webfuse supported the specific context at CQUni.

> my positive experience with other Infocom systems gives me confidence that OASIS would be no different. The systems team have a very good track record that inspires confidence (Jones, Cranston, et al., 2005, n.p.)
>
> The key to easy use of OASIS is that it is not a off the shelf product that is sooooo generic that it has lost its way as a course delivery tool. (Jones, Cranston, et al., 2005, n.p.)
>
> I remember talking to [a Webfuse developer] and saying how I was having these problems with uploading our final results into [the Enterprise Resource Planning (ERP) system] for the faculty. He basically said, "No problem, we can get our system to handle that"…and 'Hey presto!' there was this new piece of functionality added to the system … You felt really involved … You didn't feel as though you had to jump through hoops to get something done. (Behrens, 2009, p. 126)

Webfuse also included a number of context-specific learning and teaching services, a sample includes:

- the *course barometer*;
  Based on an innovation seen at a conference (Svensson, Andersson, Gadd, & Johnsson, 1999) the barometer was designed to provide students a simple, anonymous method for providing informal, formative feedback about a course (Jones, 2002). Initially intended only for the author's courses, the barometer became a required part of all Webfuse course sites from 2001 through 2005. In 2007/2008 the barometers were used as part of a whole of institution attempt to encourage formative feedback in courses hosted by both Webfuse and Blackboard.
- *Blog Aggregation Management* (BAM); and
  BAM allowed students to create individual, externally hosted web-logs (blog) and use them as reflective journals. Students registered their external blog with BAM, which then mirrored all of the students' blog posts on an institutional server and provided a management and marking interface for teaching staff. Created by the author for use in his own teaching in 2006, BAM was subsequently used in 26 course offerings by 2050+ students and ported to Moodle as the BIM module. In reviewing BAM, the EDUCAUSE Learning Initiative's Guide to Blogging suggested that

  > One of the most compelling aspects of the project was the simple way it married Web 2.0 applications with institutional systems. This approach has the potential to give institutional teaching and learning systems greater efficacy and agility by making use of the many free or inexpensive—but useful—tools like blogs proliferating on the Internet and to liberate institutional computing staff and resources for other efforts (Coghlan et al., 2007, n.p.).

- A *Web 2.0 course site*.
  While it looked like a normal course website, none of the functionality – including discussion, wiki, blog, portfolio and resource sharing – for this 2007 course site was implemented by Webfuse or any other institutional system. Instead, freely available and externally hosted Web 2.0 tools and services provided all of the functionality. For example, each student had a portfolio and a weblog provided by the site http://redbubble.com. The content of the default course site was populated by using BAM to aggregate RSS feeds (generated by the external tools) which were then parsed and displayed by Javascript functions within the course site pages. Typically students and staff did not visit the default course site, as they could access all content by using a course OPML file and an appropriate reader application. The presence of the course site satisfied an expectation that there still be a course site.

Greater levels of adoption

Encouraging staff adoption was one of the main issues raised in the original Webfuse design paper (Jones & Buchanan, 1996). A difficulty in encouraging high levels of quality use of e-learning has remained a theme in the broader industrial e-learning literature. Initial use of Webfuse in 1997 and 1998 was not all that successful in achieving the goal. With only five – including the designer of Webfuse who made 50% of all edits using the system - of 60 academic staff making any significant use of Webfuse by early 1999 (Jones & Lynch, 1999).

These limitations were addressed from 1999 onwards by a range of changes to the system, how it was supported and the organizational context. The following illustrates the success of these changes by comparing Webfuse adoption with that of the official LMS (WebCT 1999-2003/4; Blackboard 2004-2009) used primarily by the non-Webfuse faculties. It first examines the number of course sites and then examines feature adoption.

From 1997 Webfuse automatically created a default course site for all Faculty courses by drawing on a range of existing course related information. For the official institutional LMS course sites were typically created on request and were then manually populated by the responsible academics. By the end of 2003 – 4 years after the initial introduction of WebCT as the official institutional LMS – only 15% (141) of courses from the non-Webfuse faculties had WebCT course sites. At the same time, 100% (302) of the courses from the Webfuse faculty had course sites. Due to the need for academics to populate WebCT and Blackboard courses sites, the presence of a course website didn't necessarily imply use. For example, Tickle et al (2009) report that 21% of the 417 Blackboard courses being migrated to Moodle in 2010 contained no documents.

Research examining the adoption of specific categories of LMS features provides a more useful insight into LMS usage. Figures 1 through 4 use the research model proposed by Malikowski, Thompson, & Thies (2007) to compare the adoption of LMS features between Webfuse (the thick continuous lines in each figure), CQUni's version of Blackboard (the dashed lines), and a range of adoption rates found in the literature by Malikowski et al (2007) (the two dotted lines in each figure). This comparison is available for four of the five LMS feature categories identified by Malikowski et al (2007): content transmission (Figure 1), class interaction (Figure 2), student assessment (Figure 3), and course evaluation (Figure 4).

The Webfuse usage data included in Figures 1 through 4 only include actual feature use by academics or students. For example, from 2001 through 2005 100% of Webfuse courses contained a course evaluation feature called a course barometer, however, only courses where the course barometer was actually used by students are included in Figure 4. Similarly, all Webfuse default course sites contained content (either automatically added from existing data repositories or copied across from a previous term). Figure 1 only includes data for those Webfuse course sites where teaching staff modified or added content.

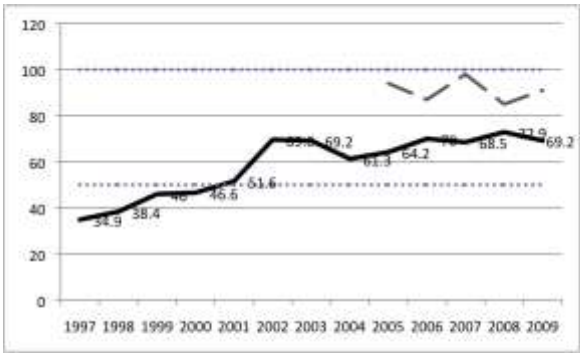

Figure 1: Adoption of content transmission features: Webfuse, Blackboard and Malikowski

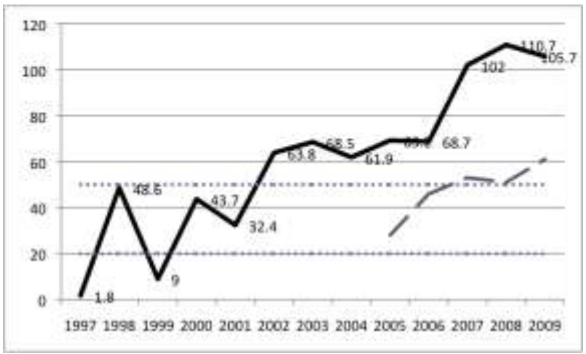

Figure 2: Adoption of class interactions features: Webfuse, Blackboard and Malikowski (missing archives of most pre-2002 course mailing lists)

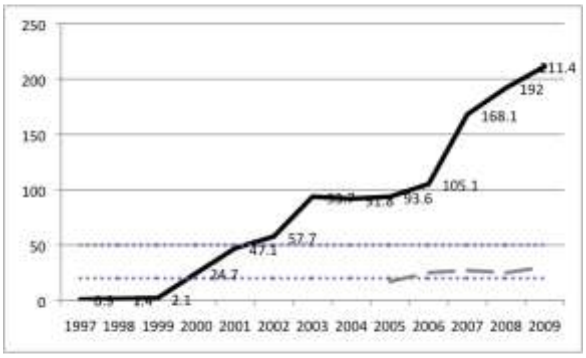

Figure 3: Adoption of student assessment features: Webfuse, Blackboard and Malikowski

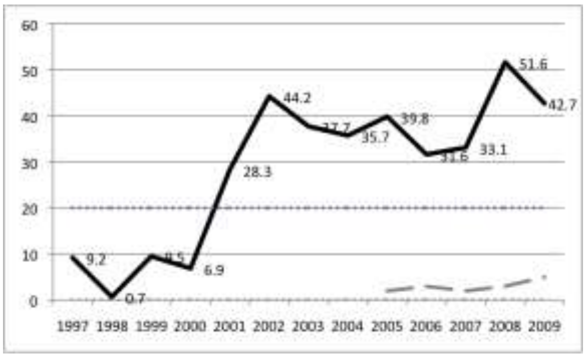

Figure 4: Adoption of course evaluation features: Webfuse, Blackboard and Malikowski

Figures 2 and 3 indicate Webfuse adoption rates of greater than 100%. This is possible because a number of Webfuse features – including the EmailMerge and online assignment submission and management tools - were being used by Blackboard courses (i.e. non-Webfuse courses). Webfuse was seen as providing services that Blackboard did not provide, or that were significantly better than what Blackboard did provide. Similarly, the spike in Webfuse course evaluation feature adoption in 2008 to 51.6% is due to a CQU wide push to use the Webfuse course barometer tool to improve formative feedback across a range of courses regardless of the LMS. Figures 2, 3 and 4 show that adoption of Webfuse features was significantly higher than the adoption of equivalent Blackboard features at CQU. It was also significantly higher than the adoption rates found by Malikowski et al (2007) in the broader literature.

Product

One of the defining characteristics of the industrial e-learning paradigm is the reliance on the Learning Management System (LMS) – be it open source or proprietary - as the *product* component of e-learning. The LMS is an example of an integrated or monolithic information system. Different types of information systems have specific sets of advantages and disadvantages that make them appropriate for certain circumstances. An integrated system offers cost efficiencies and other benefits through standardization but, at the same time, such systems constrain flexibility, competitiveness, autonomy, and increase rigidity (Light, Holland, & Wills, 2001; Lowe & Locke, 2008). Such systems are best suited to circumstances where there is commonality between organizations and stable requirements with low uncertainty. This does not seem to be a good description of tertiary e-learning over the last 10 years and especially not for the next 10. This section looks at two of the repercussions of this mismatch: 1) organizations and people must adapt to the system; and, 2) the single vendor limitation – before describing the alternate principles from the ISDT.

The first repercussion of an integrated system is captured a technical staff member participating in CQUni's 2003 LMS selection process who suggested that "we should seek to change people' behaviour because information technology systems are difficult to change" (Sturgess & Nouwens, 2004, n.p.). Rather than being an isolated perspective, this comment captures the accepted industry best practice recommendation to implement integrated systems in their "vanilla" form because local changes are too expensive (Robey, Ross, & Boudreau, 2002). Maintaining a vanilla implementation constrains what is possible with the system, limiting change, innovation and differentiation. So rather than enable exploration of and learning from contextually appropriate pedagogical designs, the nature of an LMS encourages adoption of pedagogical designs that are supported by the LMS.

For example, in 2007 an instructional designer working on a redesign of a CQUni course was stymied by the limitations of the Blackboard LMS. Blackboard could not support the required number of group-based discussion forums required by the new course design. Normally, with an integrated system the pedagogical approach would have to be changed to fit the confines of the system. Instead the implementation of the course site was supplemented with use of one (at this stage Webfuse had three different types of forum) of the Webfuse discussion forums allowing the original educational design to be followed. Similarly, when CQUni adopted Moodle, academic staff teaching large first year courses using the Webfuse BAM functionality were encouraged to modify this practice to better fit with the capabilities of Moodle.

The regular forced migration to another version of an LMS is the extreme example of the organization being forced to change in response to the technology, rather than the technology fitting to organizational needs. It is not uncommon to hear Universities being forced to adopt a new LMS because the vendor has ceased supporting their current system. The cost, complexity and disruption caused by an LMS migration has significant ramifications. First, institutions seek a long period of "vanilla" use to recoup the cost of migrating to the new system. This reinforces the problems of forced adaptation of practice to fit the technology's limitations. Second, there is the problem of the "technology dip" (Underwood & Dillon, 2011) where the introduction of new technology creates a reduction in learning outcomes while teaching staff grapple with the new technology. Lastly, the cost and complexity of the upgrade encourages organization to engage in a long period of vanilla use of the integrated system in order to recoup the expense of the forced migration.

Another characteristic of an integrated system is that the quality of the tools available is limited to those provided by a single vendor or community. For example, a key component of the disquiet about the Curt Bonk MOOC hosted within a Blackboard LMS was the poor quality of the Blackboard discussion forum (see Lane, 2012). Similar reservations have been long held about the quality of the Moodle Wiki and Blog tools. LMS-based tools also tend not to fare well in comparisons with specialist tools. In addition, integrated systems tend to support only one version of every given tool. Leading to the situation where users can pine for the previous version of the tool because it suited their needs much better than the new.

The ISDT formulated from the experience of developing Webfuse proposes 13 principles for the form and function of the product for emergent e-learning (Jones, 2011, p. 344). These principles were divided into 3 groups:

1. Integrated and independent services.
   Rather than a system, Webfuse was positioned as the glue used to "fuse" together widely different services and tools into an integrated whole. Webfuse was an example of a best-of-breed system, a type of system that provides more flexibility and responsiveness to contextual needs (Light et al., 2001). For example, when the existing discussion forum tool was seen as limited, a new discussion forum tool was selected and integrated into Webfuse. At the same time the old discussion forum tool was retained and could be used by those for whom it was an appropriate fit. While new tools could be added as required, the interface used by staff and students remained essentially the same. There was no need for expensive system migrations and the resulting technology dip.
2. Adaptive and inclusive architecture.
   Almost all LMS support some form of plug-in architecture where external users can develop new tools and services for the LMS. This architecture, however, is generally limited to tools written specifically for the LMS and its plug-in architecture. The Webuse "architecture" was designed to support the idea of software wrappers enabling the inclusion of a much broader array of applications.
3. Scaffolding, context-sensitive conglomerations.
   A conglomeration is not simply a service such as a discussion forum. Instead, it may combine multiple e-learning services with additional scaffolding such as institutionally specific information and expert knowledge. Conglomerations should also provide opportunities for academics to observe, question and discuss applications of the services. This echoes Laurillard's (2008, p. 144) suggestion that academics need tools and environments that enable them to gain "access to others' ideas and outputs, but also to support their own innovation, changing others' design, exploring, experimenting, adapting, reflecting and collaborating".

Writing about the need for universities to embrace diversity Thomas (2012) talks of Procrustes who "would stretch and sever the limbs of his guests to fit the size of his bed. We, too, are continuing to stretch and shape our higher education to a particular standard to the detriment of students and society alike" (para 22).
In terms of e-learning, that "particular standard" is defined by the integrated information systems – the products - we are using to implement industrial e-learning. Rather than learn from the use of these systems, universities are being constrained to a particular standard.

Process

Industrial e-learning – almost by definition – uses a planning or purpose driven approach to its process. Such an approach to process – labeled as teleological by Introna (1996) – has dominated organizational theory and practice to such an extent that it has become taken for granted. Anything else is often seen as irrational or inefficient. This is despite the debate between the "planning school" of process thought and the "learning school" of process thought being one of the most pervasive debates in management (Clegg, 2002). Prior papers (Jones, Luck, McConachie, & Danaher, 2005; Jones & Muldoon, 2007) have used the nine attributes of a design process formulated by Introna (1996) to demonstrate the limitations of teleological approaches to process when applied to the practice of e-learning. Rather than repeat the argument from these papers, this section offers two new examples of the limitation of teleological processes to e-learning before briefly describing the alternative, emergent approach used in Webfuse.

The strategic process used to transition CQUni to the Moodle LMS described by Tickle et al (2009) is almost an archetypal example of a teleological process. One of the institutional policies introduced as part of this strategic process was the adoption of Minimum Service Standards for course delivery. This approach was intended to act as a starting point for "integrating learning and teaching strategies that could influence students study habits" and to "encourage academic staff to look beyond existing practices and consider the useful features of the new LMS" (Tickle et al., 2009, p. 1042). The minimum standards were planned ahead of time and embedded in a web-based checklist. The expectation was that teaching staff would actively compare the design of their course site against the minimum standards and tick off elements against the checklist. A senior lecturer widely recognized as a quality teacher described the actual process adopted as

> I go in and tick all the boxes, the moderator goes in and ticks all the boxes and the school secretary does the same thing. It's just like the exam checklist (Anonymous, personal communication, 1st October, 2010).

The checklist was removed in 2011.

One of the three necessary requirements for teleological processes identified by Introna (1996) is that the designers must be able to manipulate the system's behaviour. Such manipulation is necessary to ensure achievement of the plan. Technology development and diffusion needs cooperation, however, it takes place in a competitive and conflictual atmosphere where different social groups – each with their own interpretation of the technology and the problem to be solved – are inevitably involved and seek to shape outcomes (Allen, 2000). In terms of tertiary e-learning, academics form a significant part of the social group. Academics are trained not to accept propositions uncritically and subsequently cannot be expected to adopt strategies without question or adaptation (Gibbs, Habeshaw, & Yorke, 2000).

By definition, a teleological process is focused on achieving the established purpose. Introna (1996) identifies two other requirements for teleological processes: a stable and predictable system, and the ability to accurately determine goals ahead of time. Such assumptions do not provide space for learning and changes to the plan. The philosophical foundations of teleological processes –"notions of rationality, science and method" (Ciborra, 2002, p. 1) – are in direct contradiction to views of learning meant to underpin the best learning and teaching. Rossi and Luck (2011) talk about how "[c]onstructivist views of learning pervade contemporary educational literature, represent the dominant learning theory and are frequently associated with online learning" (p. 62). Wise and Quealy (2006) argue, however, that

> while a social constructivist framework may be ideal for understanding the way people learn, it is at odds not only with the implicit instructional design agenda, but also with current university elearning governance and infrastructure (p. 899).

Amongst the many negative ramifications of this mismatch is where staff development sessions become focused on encouraging use of the features of the chosen LMS, rather than quality learning and teaching. It is one of the factors that contributes to staff developers being "seen as the university's 'agent'" (Pettit, 2005, p. 253). It encourages the perception that change is being done to academic staff, rather than with or for them.

The ISDT abstracted from the Webfuse work includes 11 principles of implementation divided into 3 groups (Jones, 2011, p. 354). The first and third groupings will be described in the next section. The second grouping – An adopter-focused, emergent development process – involves using in-depth knowledge of the human, social and interpersonal aspects of the institutional context to actively develop the system to respond quickly to real, contextual needs. It is through this type of process that the institutional implementation of e-learning – more correctly the people involved with e-learning - can learn from what is going on, prepare for the future and lead in a climate of change.

People

The conceptions of product and process found within industrial e-learning directly influences the type of positions created to support industrial e-learning and the organizational structures within which they operate. The cost of an integrated system, the assumption that it is the only valid tool for e-learning, and a process focused on achieving a planned purpose (i.e. widespread effective use of the LMS) leads to the creation of positions tasked with achieving that process, rather than with responding to changes in the environment. In addition, it leads to these roles being slotted into hierarchical structures that divide roles (e.g. technical, instructional design, teaching etc.) into different branches of the organization with separate reporting lines. This section briefly examines just some of the limitations of this approach.

The logical decomposition inherent in teleological design creates numerous, often significant, organizational boundaries between the people involved with using and supporting e-learning. Such boundaries inhibit the ability to integrate knowledge across the organization as illustrated by Rossi and Luck (2011):

> During training sessions … several people made suggestions and raised issues with the structure and use of Moodle. As these suggestions and issues were not recorded and the trainers did not feed them back to the programmers ... This resulted in frustration for academic staff when teaching with Moodle for the first time as the problems were not fixed before teaching started (p. 68).

Logical decomposition separates out the trainers, the programmers and the academic staff that hinder knowledge sharing. This separation is typically bridged by a governance structure that requires any need for changes to flow up from the users to a central committee that includes senior leaders from the faculties, academics and central IT and learning and teaching representatives. If approved, changes are passed onto programmers. The length of the communication chain from the source of the original need up to this central committee (and back again) translates into a game of Chinese Whispers as the original need is interpreted through the experiences and biases of the people along the way. Leading to the impression reported by Rossi and Luck (2011) "[t]he longer the communication chain, the less likely it was that academic users' concerns would be communicated correctly to the people who could fix the problems" (p. 69). In addition, the significant cost of traversing this chain of communication also means that it is typically not worth the effort of raising small-scale changes thereby starving such needs of attention. Especially when the nature of the process and the product typically precludes the ability to make small changes efficiently.

Logical decomposition also encourages different organizational units to focus on their part of the problem and lose sight of the whole picture. An IT division evaluated on its ability to minimize cost and maximize availability is not likely to want to support technologies in which it has limited expertise. This is one explanation for why the leader of an IT division would direct the IT division's representatives on an LMS selection panel to ensure that the panel selected the Java-based LMS. Or a decision to use the latest version of the Oracle DBMS – the DBMS supported by the IT division - to support the new Moodle installation even though it hasn't been tested with Moodle and best practice advice is to avoid Oracle. A decision that - at one institution - led to significant periods of unavailability during the first few weeks of the "go live" term.

An extension of the problem of mixed purposes is the need to have the support and engagement of a senior leader. Often seen as a critical success factor for any significant change project, this also brings problems as the successful completion of the project is tied to the leader's progression within the leadership hierarchy. Consequently creating the situation where the project will be deemed a success, regardless of the outcome.

The first five Principles of Implementation from the Webfuse ISDT (Jones, 2011, p. 354) were grouped under the label "A multi-skilled, integrated development and support team". The Webfuse development team were responsible for and had expertise in help-desk support, software development, user training and some ad hoc instructional design/staff development. The team was a part of the faculty and members regularly interacted with academics in the common room, in corridors, and on social occasions. Members of the Webfuse team had been students and took on a range of teaching tasks. Team members were able to make changes to the system in response to their experience. At its best, the team organized the governance process with oversight from faculty management and academic staff members. The people and organizational structures enable the on-going modification of the system in response to new insights gained during system use.

Conclusions

It has been argued that the characteristics of the industrial e-learning model currently dominating the practice of tertiary e-learning are inappropriate for the requirements of tertiary e-learning, both now and especially into the future. In particular, the nature of the components of industrial e-learning examined here – product, process and people – actively prevent the individuals and organizations involved from learning from their experience and responding to change. The product – the LMS, an example of an integrated system – is difficult to change and best-practice advice is to implement it as is. The process – a plan-driven approach to process – is typically focused on the successful and efficient implementation of the chosen integrated system, rather than responding to and learning from change. Finally, the people and roles involved in industrial e-learning are created and organized to support the chosen process. These mutually reinforcing trio of conceptions appear to limit the capability of university e-learning from learning for the future and leading in a climate of change.

An alternative to industrial e-learning was presented. This alternative is based on a product that can be rapidly modified in response to learning that arises from an adopter-focused, emergent development process implemented by a multi-skilled development team interacting regularly and deeply with the users of the system. As implemented with the Webfuse system this alternative approach has resulted in a system that is specific to the needs of the institutional context and shown greater levels of adoption. The underpinning philosophy of this alternative is closer to that of social constructivism, situated cognition and communities of practice and seems a better match for institutions wishing to learn for the future and respond effectively to a climate of change. While by no means a simple set of principles to adopt - not the least because of the entrenched and almost unquestioned acceptance of the principles of industrial e-learning – this approach does appear to offer a better fit for the requirements of tertiary e-learning and the broader context within which it operates.

Teachers, and their opinions, matter: Analysing staff perceptions of the effectiveness of online discussion forums

Hazel Jones
Publication Unit
Australian College of Applied Psychology

This paper analyses a recent survey on staff perceptions of the effectiveness of discussion forums in a small private institution. The responses will inform future opportunities and strategies for professional development and student support within the College; setting of expectations and benchmarks for staff and students and increasing awareness of these as well as curriculum and learning design. The overall aim of the research is implementing practices that will be sustainable and address current challenges within the College of improving student retention, engagement and learning. Results indicate that while staff are generally inexperienced in the online environment they are comfortable with many aspects of online discussion forums. Main areas of concerns for staff are low levels of student engagement with each other and subject material. Staff are most interested in developing strategies to help with improving student engagement. Two profiles of staff from opposite ends of the spectrums of responses are developed and compared.

Keywords: effectiveness of online discussion forums, staff perceptions, student engagement

Introduction

Future challenges for institutions and academics come in many facets, on many levels. This paper discusses a specific challenge in the online environment - how can students be encouraged to engage in discussion forums. Whilst on the surface this may seem a simple challenge there are in fact many layers and aspects to this, including why do institutions want students to engage, how and when is this explained to them, what support and training is needed for teaching staff and students, how can curriculum and learning environments be designed to best support and encourage this. What benchmarks and examples exist on which future development can be modelled? What institutional cultures will need to be developed; what workload and administrative implications will arise and how can this be achieved in a way which will allow the innovations to be sustainable in the long term? This paper does not seek to answer all of these questions, rather it takes a snapshot of where staff believe they currently are and seeks to use the responses as a starting point in developing a road-map to the future.

Context

The Australian College of Applied Psychology is a small, private college offering courses across Vocational and Educational Training (VET) and Higher Education from Diploma to Masters level in the disciplines of counselling, communication, coaching, people management and psychology. The College is multi-campus and offers on-campus and Flexible Delivery (FD) subjects. FD, in this college, involves online learning, utilising the Moodle platform, supplemented by occasional on-campus workshops and/or workplace placements. Most teaching is completed by casual staff (educators) working with small groups of no more than 20 students. Staff are usually practitioners who teach on a part-time basis, with a small number of full- and part-time academic staff in the College also teaching FD classes. Educators, and students, are provided with all subject content in written format (either hard copy and/or via Moodle) which includes weekly activities, assessment tasks and associated readings and resources. Flexible Delivery classes have only be offered for a few years having evolved from a distance education model. Discussion forums are provided in three areas – Announcements, for educator communication; general discussion forum where staff and students can initiate and contribute to discussions on any aspect of the subject and learning forums which are pre-determined and associated with specific learning activities. This delivery model helps to create a consistent and transparent learning environment for all students.

The survey discussed in this paper is part of an ongoing research project evaluating the use of discussion forums in FD classes, with an aim to improve the effectiveness of this usage and hence increase student engagement and retention. This project was commenced as part of the ascilite Collaborative Community Mentoring programme in 2011(Jones, 2011). The results of the staff survey and the larger project will inform future staff development options and teaching practice; student support; setting of expectations and benchmarks for staff and students and

increasing awareness of these as well as curriculum and learning design. The larger project involves an ongoing, detailed analysis of discussion forum usage with the aim of determining how these are being used and to then inform how practice and culture can be changed to improve student engagement and retention.
This research is important as it looks across sectors, analysing responses from staff in VET and HE and making comparisons between the sectors for one of the survey questions (space does not allow this for all questions). Although the College is a small private institution the results and discussion will be relevant to public universities and other institutions. The results will be able to inform others who are looking at implementing a change in the way educational technology is used within their institution. As a quantitative survey approach, specifically related to online discussion forums, involving staff teaching across many subjects in both VET and HE sectors in Australia this research adds a new dimension to the existing literature.

Research Questions/Rationale

The aim of the research is to analyse staff perceptions of current levels and types of student engagement; learning occurring within online discussion forums, and the effectiveness of these discussions. The research will investigate whether staff have a clear understanding of discussion forum usage and whether they perceive these are an effective component of learning online for FD students. Gaining insight into staff perceptions will enable us to determine how closely those perceptions match reality (as measured from usage logs and quantitative analysis of postings) and will help determine what (if any) measures will need to be implemented to help improve the usage of the forums.

Asking educators about their perceptions affirms that they are being heard and they are being empowered to be involved in the future of their development and the way in which discussion forums are developed (Baran, Correia & Thompson, 2011). The results also give a baseline so future research can determine if innovations influence change.

Literature Review

This literature review included the usual Google scholar, databases and journal indices searches using the keywords of student engagement, staff perceptions and online discussion forums, separately and in combinations. The focus of the searches was to find examples of similar studies and determine if there is consensus on best practice in engaging students in online discussion forums, with a particular emphasis on the importance of the teacher's role in encouraging this.

Fundamental to the purpose of this research is what is meant by student engagement. The definition that has been adopted through this research is that of Beer Clark & Jones: "engagement is the amalgamation of a number of distinct elements including active learning, collaborative learning, participation, communication among teachers and students and students feeling legitimated and supported." (Beer, Clark & Jones, 2010; p76). A complementary view is that there are many types of student engagement which occur during their learning including engagement with content, educators, other students and technology (Fleckhammer & Wise, 2011). This survey includes questions on all of these aspects of engagement. It is important to note that whilst these definitions and terms refer to student engagement in general terms, they do also apply to the specific area of online discussion forums.

There is an extensive body of literature on student engagement and the factors that can positively impact on this. These factors include pedagogical and technology-related aspects, student and teacher conceptions as well as curriculum and learning design (Biggs & Tang, 2007; Salmon, 2002; Trigwell & Prosser, 1996). A more detailed discussion of this literature is not included here due to time and space constraints but will certainly be undertaken as the College maps out future directions, as this will be a vital component in determining overarching principles and frameworks to be adopted. One factor though is now briefly discussed.

There is much evidence in the literature that teacher presence in online discussion forums is an important factor in student engagement (Garrison & Cleveland-Innes, 2005; Oliver & Shaw, 2003). This presence includes a number of roles and associated responsibilities; including leading, encouraging, summarising, responding to direct questions and providing feedback and cover content, pedagogical, technological and administrative areas. (eg Goodyear et al., 2001; Jahnke, 2010; Salmon, 2011). There are many variables that impact on the quality and quantity of teacher's posts including their pedagogical framework, whether they believe discussion forums serve a useful purpose in their context and their levels of experience and confidence in the use of forums (Anderson et al 2001) The survey draws out staff perceptions of their abilities in many of these aspects.

Previous studies of staff perceptions of the use of discussion forums, or other learning technologies, have mainly focussed on qualitative analysis using interviews and focus groups, involving small numbers of staff. (Challis, Holt & Rice, 2005). One report of a large survey of staff (and student) perceptions of use of a Learning Management System (LMS) at a large American university was found (Lonn & Teasley, 2009) This though was for on-campus teaching, supplemented by the LMS. There is agreement that there are perceived benefits from using technologies in the areas of student learning, enhanced communication (Lonn & Teasley, 2009) and student engagement (Waycott et al, 2010). Limitations of technologies were also noted in some studies, including increased workloads; technology being the driver, rather than pedagogy; inappropriate language on discussion forums; and loss of face-to-face interaction (Waycott et al., 2010).

As is reported in more detail later, many respondents to this survey mentioned the possibility of making participation in discussion forums compulsory and/or assessable. A review of literature on this matter indicates that there is no one dominant position on this. If an approach based on constructive alignment is adopted(Biggs & Tang, 2007) it may be more appropriate to ensure that learning activities and associated discussions are aligned with the learning outcomes, rather than having the discussion forums themselves assessed. Oliver (2002) offered alternative viewpoints of this debate suggesting assessment could help meet learning outcomes versus this could take responsibility for learning away from students. Oliver and Shaw (2003) also provide two very different views of the influence of assessment on participation. Markel (2001, p1) notes “making weekly participation in the discussion a requirement “institutionalizes” the discussion forum within the course” while Christie & Garrote note that the “way forward in the more active and productive use of LMS and OADs[1] is to weave continuous assessment into the use of such tools” (Christie & Garrote, 2011; p 237). This contrasts with O’Reilly and Newton (2002) who report that in the area of humanities structured, assessable discussion forums are no longer used as there is a high uptake of student interaction on the discussion forums, suggesting that as students become more confident and aware of the benefits of active engagement, assessment is no longer needed as an incentive. There will need to be considerable discussion and further research to allow the College to make decisions on this.

One of the limitations of the literature is that there does not appear to be much, if anything, written on benchmarks for participation in discussion forums with no research being found on minimum levels of contributions from staff or students. This may well be due to the fact that every institution, subject, teacher has different ideas and uses for discussion forums and hence there are no relevant benchmarks. Benchmarks can though provide guidance for staff on their reflection of their abilities as an online teacher and may be needed to ensure staff are reflecting on appropriate characteristics (Northcote, Seddon & Brown, 2011). As part of the ongoing project, decisions will need to be made as to the educational philosophies, pedagogical frameworks and curriculum and learning designs that will underpin future directions and these will then be able to inform any benchmarks that are set.

The Australasian Council on Open, Distance and E-Learning (ACODE) have developed a series of benchmarks including guidelines and good practice statements which are relevant to the use of technology in learning and teaching (ACODE, 2008). Of particular relevance to this research are Benchmarks 4, 5, 7 and 8 which relate to pedagogical application and staff and student support and training. The ALTC Good practice report: technology-enhanced learning and teaching prepared by Keppell, Suddaby and Hard (2011) provides ten outcomes that represent best practice in this area and all of these have relevance to this project and the future challenges in developing the use of online discussion forums within the College.

Methodology

The survey for staff was created in surveymonkey and 112 invitations to participate were sent to all staff and casual educators who were identified as teaching by FD mode at the beginning of 2012. This was distributed by email with one school sending a preceding message advising staff about the survey, confirming their support for the project and encouraging staff to respond. The survey was distributed in Week 4 of Term 1 as this was considered a relatively quiet period for staff, after the initial rush at the beginning of Term and prior to any assessment. One reminder email was sent two weeks after the original request. All responses were anonymous and ethics approval was sought and granted for this project (ACAP HREC Approval No 046110112).

The survey questions were developed within the College after discussion and consultation with senior staff around the types of questions and taking into account the main ways in which the discussion forum, and other

[1] OADs are online asynchronous discussions

technologies are currently used. The questions were generally Likert scale questions with some free response questions at the end of the survey. The full survey is available upon request, and some of the questions are included in the following section.
In addition an analysis of logs for Announcement posts was conducted in the Moodle online classrooms for all subjects taught by FD in terms 1-3 for 2011 for VET and HE courses for comparison with the perceived usage as identified by staff in their survey responses and this is discussed in a later section.

Survey results

This section looks at some of the results from the survey; not all questions are reported here due to lack of space. The consequences of these results and possible areas for future action and research are discussed in a later section. Forty eight responses were received from 112 invitations emailed. However 10 of these were only partial responses and were eliminated from the analysis as they had only answered the first question, which was agreeing to participate. This means there were 38 valid responses which represents a response rate of 34%.

Respondents are from across all schools and both sectors of the College. Where responses are compared across sectors, the responses from the five staff are who indicated they teach across both the School of Counselling (SoC) and VET are duplicated in both sectors. The results for the one respondent who did not respond to the question regarding in which school they taught, were not included in any comparison across sectors.

There were two questions relating to teaching experience and the responses to these showed that, as would be expected, educators have a range of experience. Responses indicate that most participants are relatively new to the College as well as the online environment, rather than one or the other. The largest group are those educators who have no experience teaching online, although they have been teaching at the College for 1-5 years.

There were three questions related to time spent on discussion forums, with workload expectations at the College, for both HE and VET, being that educators spend approximately three hours per week facilitating learning in the online class space over two or three days each week. The responses from these questions, shown in Table 1, indicate that most educators spend more time in the online class space than is expected of them. They also indicate that there is a large variation in the level of engagement of educators and that generally those educators who spend more time reading students' posts also spend more time making their own posts. A positive result from the question "On how many days per week (on average) do you read discussion forums and/or post to these forums, for each group?" is that 60% of respondents view or post on 4 or more days per week which would indicate that they do have a visible presence in their groups. This is also above the minimum expectations of the College.

Table 1: Time spent on discussion forums

	Time posting (per week)			
Time reading (pw)	<30 minutes	30-60 minutes	1-2 hours	>2 hours
<30 minutes	1	2	1	0
30-60 minutes	1	5	3	0
1-2 hours	0	4	2	4
>2 hours	0	0	3	9

(Note: Three respondents only answered one of these questions and hence are not included in this Table)

Educators were specifically asked about the number of Announcements they post each term. Announcements, in this College, are a discussion post utilised to present important information to students by educators. They differ from general discussion forums in that only staff can post to the forum and students cannot respond to them. Within the College these are considered an essential form of communication and there is an expectation that educators will post at least one announcement per week over a twelve week term. Figure 1 shows that the majority of respondents (22 of 35 or 62.9%) indicated that they post at least 15 Announcements per term, indicating they are communicating regularly with their students and meeting the minimum requirements.

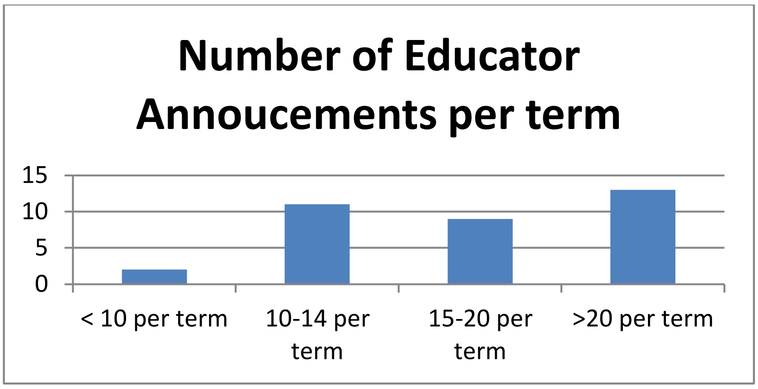

Figure 1: Number of announcements per term

Figure 2 shows the comparison of perceived numbers of announcements, sorted by VET and HE sectors, with a summary of actual posts taken from quantitative analysis of discussion forums for all FD subjects over the full 2011 academic year (707 groups in total). This comparison shows that the perceived situation has quite a different pattern to the actual situation. The most likely explanation for this is that those educators who did respond to the survey are those who are more dedicated and engaged and hence will be in the group who post more frequently. Some respondents may have answered this question taking into account the expectation that staff will make weekly announcements. Different trends between VET and HE for both perceived and actual results, can be seen, with VET staff overall having a lower engagement than HE staff.

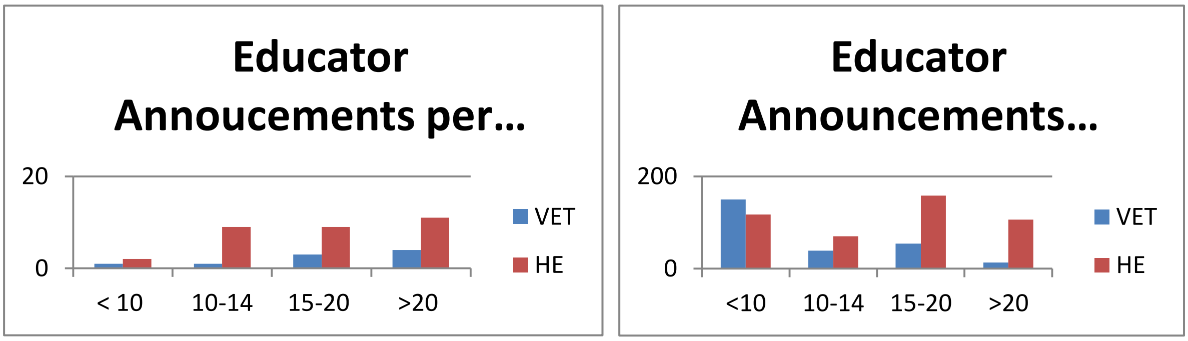

Figure 2: Comparison of perceived and actual announcements

Staff were asked to rank from 1 (most used) to 6 (least used) the most common uses of discussion forums by themselves and their students. These results are summarised below. One pleasing aspect of these responses is the perceived low level of discussion about administration and process questions, as this tends to suggest that both staff and students either have a good understanding of these areas and /or that the discussion forums are not considered the most suitable forums in which to raise these questions. Of concern though is the fact that community building is towards the bottom of the priorities for both staff and students.

Most used by educator
1. Weekly announcements
2. Introductions
3. Responding to assessment questions
4. Responding to content questions
5. Community building
6. Responding to admin and process questions

Most used by students
1. Assessment questions
2. Content questions
3. Introductions
4. Weekly announcements
5. Admin and process questions
6. Community building

The survey also asked a series of questions in regards to educators' current ability in all aspects of discussion forums. Results are summarised in Table 2 which suggests that the majority of staff are comfortable with the fundamentals of using discussion forums and responding to students as well as the more difficult tasks of encouraging critical thinking and summarising threads. The main areas of concern for staff are in encouraging those students who are not actively participating in the forums, whilst also dealing with those students who dominate a discussion.

Table 2: Current Ability

	Very limited	I can get by	I feel comfortable with this	I do this regularly	This is one of my strengths
Start a new discussion thread	0 (0%)	0 (0%)	5 (13.2%)	19 (50.0%)	14 (36.8%)
Post a response	0 (0%)	0 (0%)	4 (10.5%)	20 (52.6%)	14 (36.8%)
Engage students in discussions regarding content	1 (2.6%)	4 (10.5%)	14 (36.8%)	13 (34.2%)	6 (15.8%)
Summarise a discussion thread	2 (5.3%)	2 (5.3%)	19 (50.0%)	8 (21.1%)	7 (18.4%)
Encourage students to think critically about the content	1 (2.6%)	4 (10.5%)	13 (34.2%)	13 (34.2%)	7 (18.4%)
I am able to lead a discussion	0 (0%)	4 (10.5%)	10 (26.3%)	15 (30.5%)	9 (23.7%)
Encourage students who are not posting to the forums	4 (10.5%)	10 (26.3%)	10 (26.3%)	11 (29.0%)	3 (7.9%)
Deal with students who dominate a discussion	1 (2.6%)	8 (21.1%)	21 (55.3%)	4 (10.5%)	2 (5.3%)

Table 3 illustrates responses in regards to student engagement on different levels. Of particular concern is the perception that there is limited engagement between students (73.8% of respondents rated this as very low or limited) and with the content (58.3% rated this as very low or limited), as these are the areas in which most learning would be expected to be occurring. Quantitative and qualitative analysis of actual usage is currently underway which will allow a comparison between perceptions and reality.

Table 3: Student engagement levels

	Very low	Limited	Satisfactory	More than I would expect	Very engaging
How do you rate the percentage of students from each group who engage in the online discussion forums?	8 (21.1%)	16 (42.1%)	10 (26.3%)	3 (7.9%)	1 (2.6%)
How do you rate the number of postings from students?	6 (15.8%)	18 (47.4%)	11 (29.0%)	2 (5.3%)	1 (2.6%)
How do you rate the engagement of students with each other?	7 (18.45%)	21 (55.3%)	8 (21.1%)	2 (5.3%)	0 (0%)
How do you rate student's engagement with course content through the discussion forums?	3 (7.9%)	18 (47.4%)	13 (34.2%)	4 (10.5%)	0 (0%)

The survey included six open response questions which were grouped as most important uses, most effective uses and professional training/support needed for staff and students. Figure 3 indicates the range of responses from staff for the questions regarding usage. It is pleasing to see that most staff consider community building and critical thinking/enhancing learning as the most important uses. Questioning is considered the most effective use for both student learning and engagement. The fact that staff consider questions posed by themselves as the most effective use for learning and engagement could suggest that a student-centred approach to learning is not being adopted and/or that students don't take the lead in posing questions

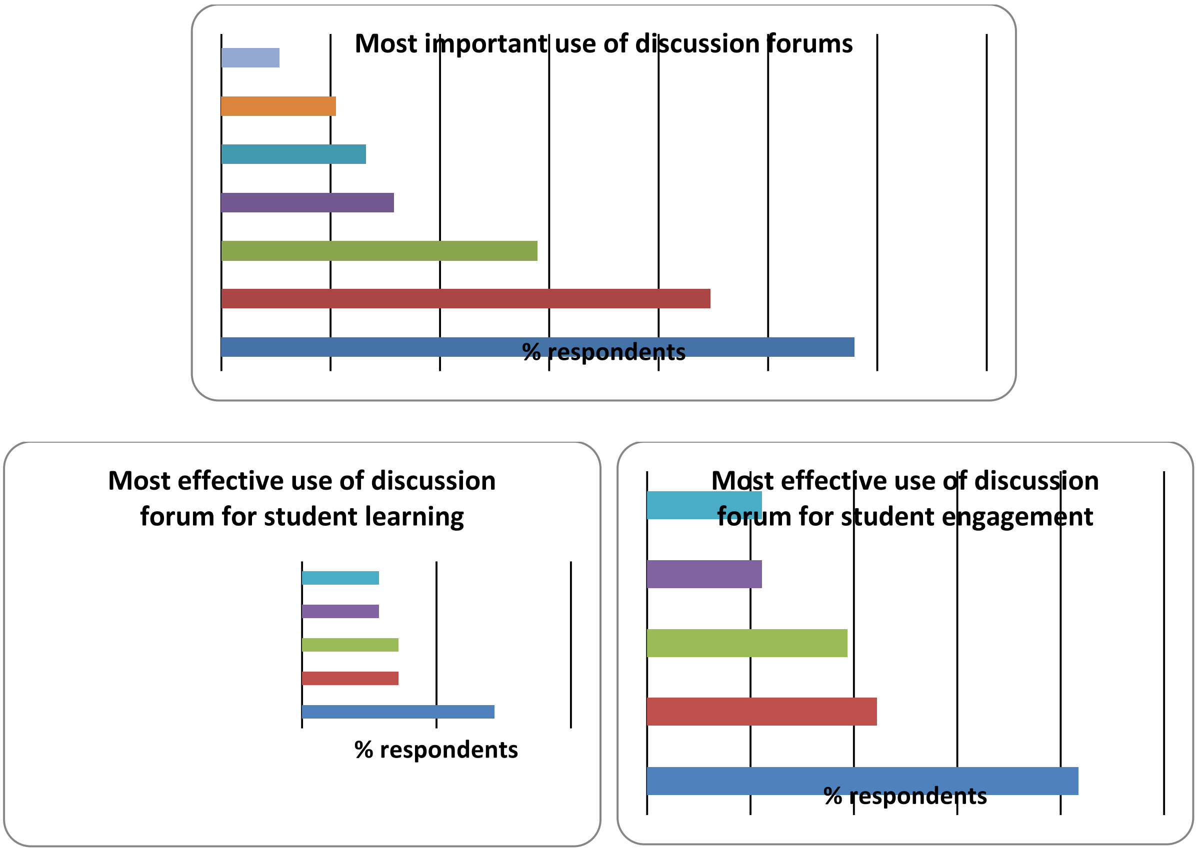

Figure 3: Uses of discussion forums

In terms of staff and student development responses were mainly split between technological areas (28.6% for staff development and 37.5% for student training), for example how to navigate site, how to use other technologies and pedagogical issues such as how to encourage and maintain student participation and engagement (32.1% for staff development). For student support some main areas suggested were in explanation of why it is important to engage and indicating levels of participation expected (25%). There was also support for student training to occur as part of an orientation programme before the start of term (18.8% of respondents). 14.3% of respondents indicated they have either completed the FoLTO[2] course or are currently participating in this or other training and just 7.1% indicated they did not wish to receive any training. It is interesting that there is no mention of workload issues at all in any responses, especially as this has been mentioned in informal conversations with some educators, and this is also in contrast to other studies.

The final question gave respondents the opportunity to make any further comment on any aspect of discussion forum usage. 54.3% of respondents offered the opinion that there needed to be some compulsory (and possibly assessable) component to encourage student participation and engagement. Other suggestion made were providing expectations of participation levels, having more structure and including more interactive learning materials. Some of the main issues raised included students lacking in confidence to post; students being too busy or not interested in participating and participation rates dropping during term, especially when assessment items are due.

[2] FoLTO is a recent initiative within the College for staff development (Foundations of Learning and Teaching Online course). This is a 12 week course offered to staff new to teaching by FD. The course is run completely online, giving staff experience at being an online learner.

Analysis of responses

This section discusses two sample areas of the survey, indicating the depth and breadth of analysis that has occurred from the survey – space does not allow for in-depth analysis of all questions.

Making participation compulsory

Whilst there were many respondents who advocated for discussion forums being made compulsory and or assessable there was at least one person who expressed caution in their comments for the final question "With a unit with a compulsory test component this has changed the nature of the discussion forum, where students are often wanting their responses to be marked, discourages free flowing thought". This is a comment worth considering when determining if forums will be made assessable – does this affect the learning and free flow of thought – will students concentrate on those forums that are compulsory in detriment of others.

Profile of two extremes

The variety of responses to the open response questions indicates that staff do view the effectiveness of discussion forums in very different ways, which is consistent with previous literature. Whilst there is a small minority of staff whose responses indicated only superficial engagement with the forums, a large proportion gave detailed responses regarding the most important use, often suggesting multiple uses of the forums. Examples of responses from the extremes are: "Assessments and Introductions" which contrasts with

> I use the Unit Announcements forum for content postings and information. I view the Discussion Forum as a space where building of a learning community can occur. I believe that connection between the students counters the isolating aspect of FD. A space in which any concerns, thoughts, questions can be shared and there can also be sharing of resources. I invite all students to participate as I believe it adds to the richness of the learning experience.

The responses to all questions in the survey (including those not discussed elsewhere in this paper) from the two staff who offered the above responses were analysed to develop profiles of the extremes of perceptions that currently exist within the College.

The first respondent has very limited experience, engages with discussion forums for less than two hours per week over 4-5 days and makes 10-15 announcements, are comfortable with most aspects of discussion forums, perceived student engagement on all levels to be limited, indicated that Introductions were the reason they most used the discussion forums and assessment questions the reasons most used by students. They initiate 80% of threads, contribute to 100% of threads, yet 50% of student posts were unanswered by anyone, and only 20% of students actively participate. From a list of other tools (email, podcasts, LiveChat and teletutorials), they considered only emails as less effective than discussion forums. They believe that discussion forums will only be more effective if "... they are linked to overall grade...". They felt they didn't need any staff development as they "did FOLTO it was brilliant" and believe that students don't need any training or support.

The second respondent has been teaching online for less than five years, engages with the discussion forums for more than three hours per week over 2-3 days and make 15-20 announcements. They are comfortable with all aspects of the forums, feel only student engagement with content is limited, all other aspects being satisfactory or better. Introductions are the ways in which forums most used by themselves and students and Announcements are least used by educator and community building by students. They initiate 50% of discussion threads, 50% of their posts are unanswered, whilst 30% of student posts are unanswered. They indicate that they contribute to 100% of threads and only 25% of their students are active participants. Teletutorials and podcasts are more effective than discussion forums, email about the same and they don't use LiveChat. For the open-ended questions they offered in-depth and insightful responses, suggesting use of structured activities and linking to resources as motivators for student engagement, engagement levels decrease as assessment tasks are due and that both staff and students would benefit from more support and development.

The first profile indicates someone who does not see much, if any, value in using discussion forums in their current format.This would indicate a Level 1 teacher (Biggs & Tang, 2007) or a teacher with low level conceptions of teaching and learning (Trigwell & Prosser, 1996).Whilst this profile can be thought of as somewhat alarming it does give us much food for thought on how progress can be made on the journey to effective discussion forums. Their response regarding staff development indicates it will be important to take a holistic approach and that one initiative by and of itself will not be enough to reach that goal. One focus for staff development for teachers at this level "…needs to be on helping staff examine and change their conceptions of teaching and learning" (Trigwell & Prosser, 1996). The second profile, in contrast, indicates someone who engages well with the discussion forums and their students, is comfortable in the online environment, believes there is some room for improvement in levels of student engagement and that ongoing support and training for staff and students is important. This would put them Level 3 (Biggs & Tang, 2007) or someone with sophisticated conceptions of learning and teaching (Trigwell & Prosser, 1996).

It will be important for the College to acknowledge these differing opinions and ensure that educators are kept informed of any developments that occur as a result of these responses and subsequent recommendations. As well as explaining what is happening, it will be important to indicate why changes have (or have not) occurred, otherwise staff may be left with the impression that their opinions are not valued. The following section of this paper outlines some of the initiatives that have commenced within the College.

What is already happening

There are a range of initiatives that have been implemented in the College which include

- FoLTO – as already mentioned this is a staff development programme, implemented in 2011, with 3 intakes having occurred. Analysis of the effectiveness of this course is the subject of a separate research project.
- Tech Talks – a recurring series of seminars/webinars for educators around effective use of educational technologies covering both pedagogical and technological aspects.
- Guides for students – both SoC and VET have developed and distributed brief guides regarding effective online discussion posts
- Curriculum design and learning design – as new subjects are developed and existing subjects revised, wording of activities and instructions for postings are being adapted to encourage engagement. e-tivities (Salmon, 2002) and constructive alignment principles(Biggs & Tang, 2007) are influencing these changes.

At present many of these initiatives have begun in a particular school or unit, with little co-ordination or visible institution-wide plan. It is hoped that this research will inform development of a College-wide plan, including setting of sustainable expectations, and overarching philosophies and good practice guides. The effective use of discussion forums is just one (though very important) aspect of learning and teaching online, and these principles could also be adopted for other aspects of learning and teaching.

Conclusions and future actions

This section first discusses the specific aspect of engagement with announcements, as an example of how this journey can begin, and then moves to some suggestions for the big picture. This survey is merely the first step and many of the ideas for the road-map will not become clearer until further research is completed.

The relatively low levels of engagement with announcements could be addressed by providing all educators with clearer expectations and the pedagogical reasons for this; exemplar announcements and guidelines of the content and timing of announcements. These points have already been incorporated into the FoLTO course. There is an argument that teachers who post more than 2 announcements a week, particularly later in a term, may be inhibiting student engagement and critical thinking and this is an area that could be further researched by comparing student results and feedback across different styles of educators. Reducing the input from educators later in term would be in line with moving students through the five stages of Salmon's e-moderating model (Salmon, 2011). It is also likely that these educators are early adopters of technology rather than part of the mainstream staff (Wilson & Stacey, 2004) and that this level of posting would not be seen as sustainable by the majority of staff. A more effective use of educators' limited time could be to facilitate student engagement in the discussion forums rather than the one-way transmission of information through the Announcements. This could also act as a way of decreasing workload through reduced number of posts whilst also increasing quality of engagement and depth of student learning (Anderson et al., 2001). Quantitative data cannot tell the full story (Beer, Clark & Jones, 2010) so this study is only the beginning – qualitative analysis of discussions forums in a pilot group of first year subjects is now being undertaken to determine what type of interactions are occurring, who is participating in the discussions and how much learning is happening.

Discussion and debate will be encouraged within the College to determine what pedagogical frameworks and educational philosophies will be adopted. Once this is resolved and all aspects of the larger research project are complete, a series of recommendations will be developed and distributed to senior management. These will include recommendations for future staff development and support; student support; setting of expectations and benchmarks for staff and students and increasing awareness of these, including why they are being adopted. The issues of assessment and compulsory participation; curriculum and learning design, and developing and adopting good practice guides to support any changes will also need to be addressed. This will hopefully enable a holistic approach to improving the effectiveness of online discussion forums. Important areas for ongoing research will include looking for any correlations between engagement and results as well as any links between teacher presence, student engagement and retention.

Whilst this study has been mainly about collecting data, the larger picture is to use this information to inform future practice and decision-making within the College. A picture of the current environment has been formed, which shows that engagement levels are relatively low, there is a wide range of perceptions of the effectiveness of online discussion forums and there is a call for staff and student support. Our challenge as we move forward is to develop a sustainable model that will develop the best possible online learning environment for our students.

A model for the effects of online social networks on learning

Lalitha Jonnavithula
Open Polytechnic

Alexei Tretiakov
School of Management
Massey University

Online social networks enabled by social networking software, such as Facebook or Google Plus, provide opportunities for e-learning and affect the behaviour of learners that participate in them. Based on social network theory, social learning theory, and theory of planned behaviour, we propose a model explaining the effects of online social networks on learning success.

Keywords: learning success, online social networks

Introduction

A social network is a structure formed by people and by connections between people, with the connections enabling interactions and exchange of information and influence (Knoke, 2008). The recent emergence of online social networks enabled by social networking software, such as Facebook or Google Plus, resulted in renewed interest in social networks in e-learning research. Social networking software can be used by instructors to create e-learning experiences. More importantly, learners may use social networking software in ways that affect their learning engagement and learning outcomes even independently, outside the control of the instructors.

Online social networks differ from offline social networks because they are not constrained by space. Online social networks can be built very fast because it is easy to establish connections and because it is easy to discover potential connections by using Internet search. Therefore, it is easy for a learner engaged in online social networks to connect to a broad variety of individuals (both other learners and non-learners). Consequently, social networks have a potential to influence learners in profound and unexpected ways.

The view that online and offline social networks can affect learning engagement and outcomes is consistent with a number of well-established theories emphasizing connections between individuals. Social constructivism (Vygotsky, 1978) asserts that learning happens via learners' interactions enabling negotiation of meanings. Social learning theory (Bandura, 1977) asserts that that individuals learn by observing others (models) and by copying behaviours perceived to lead to desirable outcomes. The theory of planned behaviour (Ajzen, 1991) suggests that an individual's behaviour is affected by subjective norm— the perceived beliefs of the individual's peers. Nonetheless, learning thus attained may differ from what instructors aim to achieve; for example, social networks may be used to learn strategies for achieving formal success by superficial learning with minimal learner engagement.

The existing research evidence on the effects of offline and online social networks is mixed. Thomas (2000) found a positive relationship between the learner's connectedness in an offline social network and learning outcomes. Cho et al. found that better-connected distance learners achieved better outcomes in an online learning environment. Yu et al. (2010) found that learners more involved in social networking using Facebook performed better academically.

In contrast, Junco and Cotton (2011) found that the use of instant messaging negatively affected learning outcomes and Junco (2012) found that the use of Facebook resulted in diminished student engagement. Both studies attributed negative effects to cognitive effort associated with social networking. In our view, subjective norm influenced by social networking peers is a plausible alternative explanation. Indeed, Junco also found that the use of Facebook resulted in increased involvement in co-curricular activities. Subjective norm may explain both of the effects discovered by Junco.

In summary, both the relevant theories and the empirical evidence suggest that even though the use of social networking software and the resulting online social network may promote higher learner engagement and better learning outcomes, the effect (including its sign) is moderated by the quality of the online social network. Based on this view, we propose the model of the effects of online social networks presented in Figure 1.

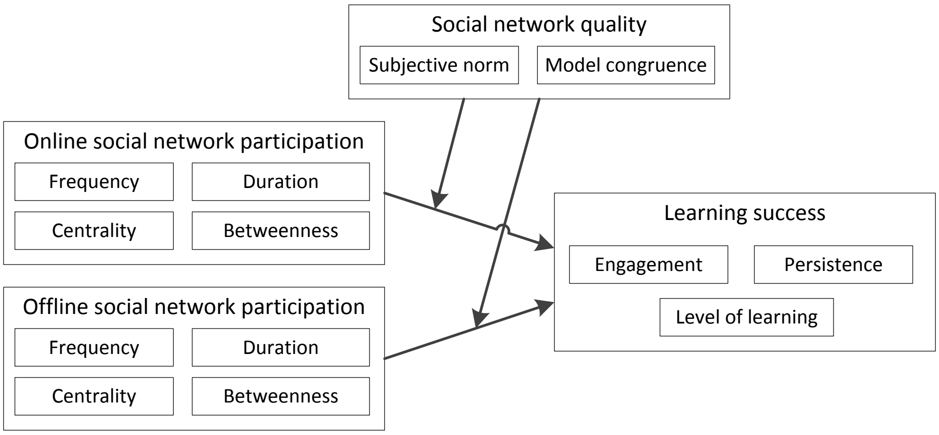

Figure 1: Effects of social networks on learning success

In the model, social network participation encompasses the duration and the frequency of online and offline contacts as well as the learner's structural role in the social network. The learner's structural role characterises the likelihood for the learner to be influenced by the network from the perspective of how the learner is connected. The structural role—a concept from the social network theory (Knoke, 2008)—is measured by centrality (the number of peers connected to, directly and indirectly) and betweenness (the extent to which the learner is important for maintaining the connectivity in the network). Social network quality encompasses the social norm induced by the network and the extent to which the models provided by the network are congruent with the learning objectives as seen by the institution of learning. Finally, learning success encompasses learner engagement, the level of learning, and learner persistence at pursuing the long-term educational objectives.

The model suggests that instructors and institutions of learning should seek ways to improve the quality of online social networks in which their learners engage. Even though online social networks are difficult to influence, they may be more open than offline networks (Cook, 2008); therefore, positive interventions may be possible.

Fostering teamwork for health care professionals in the online learning environment

Joanne Joyce-McCoach
School of Nursing Midwifery & Indigenous Health
University of Wollongong

The inclusion of group assignments as part of teaching and learning in the education of health professionals is an expectation of registration bodies and health care stakeholders. Effective teamwork skills are seen as essential for productive working relationships in multidisciplinary teams and contributing to better health outcomes for staff and health care consumers. The translation of traditional approaches to teaching health care professionals to the online learning environment requires course coordinators to re-examine the relevance, design and assessment of group work. This presentation showcases the development of online group assessments that applies these education principles to the development of an assessment initiative in a multidiscipline health curriculum. It is anticipated that this translation of group work in higher education to the online learning experience will enhance the learning outcomes and experience for health care professionals and better meet the needs and expectations of students and key stakeholders.

Keywords: online learning, group assessment, multidisciplinary teams

Developing collaboration in multidisciplinary health care teams

The preparation of students using group activities has been a long standing expectation of higher education and is a consistently identified attribute of graduates. The use of group activities has shown that there is a significant development of questioning abilities, higher order cognitive skills and promotion of deeper learning in students (Boud, Cohen & Sampson 1999). Federman Stein (2000) highlight the need for graduates to have the capabilities to work with people of different ages, gender, race and religion if they are to be able to function effectively in the current culturally diverse workplace. Furthermore healthcare employers, professional accreditation organisations and community stakeholders expectations are that healthcare professionals are able to work collaboratively (B-HERT 2002, ANMAC 2006). Health professional graduates are required to be able to establish and sustain professional relationships and demonstrate competency as a member of a team, know how to define their role as part of a team and apply teamwork skills to a range of situations.

This poster presentation will outline a Masters program developed for health care professionals in aged care that acknowledged the importance for graduates. A program outcome identified that graduates should have skills that enhance workplace partnerships and a capacity for working with users, carers and colleagues in health care. Course developers were challenged with achieving these learning outcomes in a program that was mandated to provide an entirely online learning experience.

Group assessment designed for online learning environment

There is general concurrence in the educational literature with regard to the principles which inform high-quality design of group assignments. These principles state that effective group assignments should: align to the learning outcomes; be considered by students as authentic learning experiences; involve analysis, critical thinking and problem solving skills; require students to work collectively and engage in discussion of concepts and ideas and incorporate opportunities for students to reflect (Burke, Jones & Doherty 2005; Ohl & Cates 2006).

The initiative being showcased in this poster presentation was developed for a Masters program in aged care and incorporated two group assessments, a poster and debate. The outcomes of the course were to develop student's capacity to work in partnership with health care professionals, users, carers and service providers. The online group poster assessment was developed to provide an opportunity for students to explore health care issues, policy and practice relevant in the care of older people and develop a deeper understanding for appropriate responses to the needs of this group. The online group debate was designed to facilitate students' development of a deeper understanding of the concepts and practice of rehabilitation care through its associated partnerships

As with any learning activity and assessment the principles of good design emphasise that it is vital for the assessment to be relevant to the course outcomes, differentiate between the rudiments of content, process and assessment and provide clear instructions on the expectations and deliverables required of students (Ohl & Cates 2006). Furthermore the premise for using group assessments as a mechanism for preparing students for the workforce necessitates the inclusion of feedback to students about their development of skills and attributes (Johnston & Miles 2004). Commonly it is also upheld that opportunities for students to reflect on their practice experiences is a valuable component of group assessment (Boud, Cohen & Sampson 1999).

The design of the group assessments in the Masters program incorporated educational principles by ensuring each of the assessments was closely aligned to the course outcomes. The two assessments were constructed around realistic and authentic aspects of the role and practice of health professionals in a multidisciplinary team. A commonality of the group activities was that both required students to work together across an extended period of time with a number of scaffolded outcomes that involved both formative discussions, summative decisions by the groups and individual reflection on the experience. The integrated components of the assessment activities were supported with comprehensive instructions and regular facilitation by the subject coordinators. Feedback from the students shifted from initial concerns regarding the challenges of forming and maintaining group in an online forum to a general consensus that the experience had deepened not only their understanding of the health care issues, policy and practice relevant in the care of older people but also their skills to work as a productive member of a team. This translation of group work in the Master program in aged care to an online learning experience appears to have enhanced the learning experience for these students and potentially improve their capacity as health care professionals to better meet the needs and expectations of students and key stakeholders.

The Go/No Go Association Task as a New Technology for Teaching Anti-Prejudice

Leah M. Kaufman
Australian Catholic University

Implicit measures of association have allowed researchers to study implicit prejudice based on the degree of association between representations of groups that are the target of prejudice and negative versus positive attributes. These implicit prejudice measures show that people find it more difficult to respond to a representation of the group (e.g., photo of an Aboriginal Australian) and a positive attribute (e.g., "HAPPY") using the same key than to the same representation of the group and a negative attribute (e.g., "SILLY"). Using measures of implicit association as a technology for teaching anti-prejudice is highly useful because it allows people to experience their own implicit biases. Thus, this technology makes prejudice a personally relevant issue (i.e., not something that other people possess) and, consequently, facilitates the engagement with this topic that is so essential to prejudice reduction.

Keywords: Implicit prejudice, anti-prejudice, prejudice reduction, Go/No Go Association Task

Setting the stage for teaching anti-prejudice in Australia

There are three primary reasons to include anti-prejudice teaching as a central topic of higher education courses, particularly those which produce educators, community and health service providers, or human service workers. First, discrimination on the basis of age, disability, race, and sex is illegal in Australia (e.g., Australian Human Rights Commission, 2007). There are also many other characteristics (e.g., religious belief, sexual orientation) which are protected under the Equal Opportunity Act; State Government of Victoria, 2010). These laws play an important role in the positions and activities of individuals working in a range of jobs which serve the community (e.g., nurses, teachers, lawyers, and psychologists). Second, prejudice has a known significant negative effect on the health and wellbeing of those who are the targets of prejudice (e.g., Paradies, 2006; VicHealth, 2007) and an, as yet, largely unexplored consequences for the prejudiced individual (Page-Gould, 2010). Estimates suggest that more than one quarter of (27%) Australians are directly affected by prejudice or discrimination (e.g., Dunn, Forrest, & Burnley, 2011); however, the indirect impact is potentially inestimable. There is agreement among researchers and policy makers that racism is becoming a key issue in modern Australia due to increasing multiculturalism (e.g., Australian Federal Government, 2011; Pedersen, Walker, Paradies, & Guerin, 2011). Furthermore, if one also considers other prejudices (e.g., ageism, homophobia), it is likely that many Australians will experience prejudice and discrimination, and the effects of these on their health and well-being (e.g., Barrett, Lewis, & Dwyer, 2011; Kendig & Browning, 2011). Finally, prejudice has several substantial negative consequences for universities including poorer student learning (e.g., Steele, 1997) and experiences (e.g., Graycar, 2010; Mullins, Quintrell, & Hancock, 1995; Schram & Lauver, 1988) and devaluing of the Australian university "product" to international students who cite personal safety as the most important reason for choosing an Australian university over other English-speaking universities (Marginson, 2010). Thus, the inclusion of anti-prejudice teaching in higher education courses would make it possible to ensure that graduates have greater awareness of the issues and consequences of prejudice. Furthermore, if this awareness is managed well, these graduates would not only have greater knowledge, but also less anxiety about intergroup relations which has been found to be associated with prejudice reduction (Pettigrew & Tropp, 2008). As a result, these graduates would be capable of undertaking an educated discussion on anti-prejudice and leading by example to shape the future of Australia on this important social issue.

This paper explores contemporary definitions and issues of prejudice, and reviews current literature on ant-prejudice teaching before presenting a new technology for teaching anti-prejudice, called the Go/No Go Association Task (GNAT; Nosek, & Banaji, 2001). The strengths and weaknesses of GNAT for anti-prejudice teaching, and an example on how to implement this technology are also provided. In so doing this paper to identifies the potential for social change through higher education. Finally, this paper highlights the role of learning in the present to create a better and less prejudiced future, and emphasises the role of teachers as creators of that future.

Explicit prejudice

Prejudice is commonly defined in psychology (as opposed to in law) as "an unfair negative attitude toward a social group or a person perceived to be a member of that group" (Dovidio, 2001, p.829). This definition encompasses older (e.g., traditional and blatant prejudice; Gilbert, 1951) and newer forms of prejudice (e.g., modern racism; McConahay, 1986) which can be simplistically characterised by the variation in the degree to which prejudiced people freely express or admit their prejudiced views. For example, blatant forms of prejudice involve the explicit expression of negative attitudes toward groups or individuals (e.g., "Aboriginal Australians are less intelligent than white Australians"; Pedersen & Walker, 1997) whereas modern prejudice includes the expression of negative attitude towards a groups which are contextualized or qualified (e.g., "I'm not racist, but,….") or accompanied by justification (e.g., the criticism of Aboriginal Australians as being lazy because this group experiences a documented higher level of unemployment; Australian Bureau of Statistics, ABS, 2010) or normative agreement (e.g., "everyone agrees that….").

It has been argued that modern prejudice has changed to be aligned with contemporary values and laws (e.g., anti-discrimination; Pedersen, Griffiths, Contos, Bishop, & Walker, 2000). Researchers argue that the expression of prejudice has decreased consistent with modern values and laws that promote equality and anti-prejudice, but the prejudice itself has not decreased, its expression finding increasingly subtle and insidious forms. Support for this contention can be seen in the substantial reduction in overt expressions of prejudice during the 1990s (Banaji & Greenwald, 1994), which bore no relationship with documented levels of discriminatory behaviours (e.g., aggression, helping behaviours and nonverbal communication; Schuman, Steeh, Bobo, & Krysan, 1997). These findings suggest that people were able and willing to manage their views to limit explicit expressions of prejudice, but that there was no noticeable change in prejudice and discrimination beyond the laboratory. Furthermore, a shift in research to the use of modern measures which allow people to express prejudiced views in defensible or normative ways has revealed that prejudice was still very much present (e.g., *they* are demanding too much from the rest of society; McConahay, 1986).

Implicit prejudice

Implicit prejudice is a relatively new topic of study. Implicit prejudice can be defined as the implicit negative evaluation of social group, or member of that group, on the basis of their membership. As a result, implicit prejudice cannot be directly observed by their possessor unless they are deliberately measured, thus, resulting in a more useful definition of this construct as the stronger implicit association between negative and an outgroup compared to positive (e.g., Banaji & Greenwald, 1995; Son Hing, Chung-Yan, Hamilton, & Zanna, 2008).

Different implicit measures achieve the assessment of this implicit prejudice differently. For example, implicit measures of association assess implicit prejudice using a target compatibility paradigm which uses the speed or accuracy with which a person can respond to representations of a group (e.g., photo of a Aboriginal Australian) and a positive attributes (e.g., "HAPPY") or negative attributes (e.g., "SILLY") using the same key as the measure. Thus, if Aboriginal Australian is more compatible with positive attributes responding to these two types of stimuli will be faster or more accurate. This pattern of responding is interpreted as evidence of positive implicit associations. However, if the negative implicit association is stronger, this is interpreted as evidence of implicit racism towards Aboriginal Australians. Another implicit measure of prejudice is based on the use of priming paradigms. Priming implicit procedures assess implicit prejudice as the increased speed of identification of a target when preceded by a related prime (e.g., Wittenbrink, Judd, & Park, 1997). For example, implicit racism would be indicated by the significantly faster accurate identification of words such as "AWFUL" or "HATE" as real words (e.g., a simple lexical decision) compared to words such as "SMILE" or "LIKE", following the subliminal presentation of a photo of an Aboriginal Australian. What makes these two measures tools for assessing "implicit" prejudice is not that the task itself is implicit. Rather, these are said to measure implicit prejudice because the prejudiced that is being measured is never explicitly expressed or endorsed by the person completing the measure. Thus, it is possible for individuals to express anti-prejudice, but still to demonstrate implicit prejudice which is both a strength of implicit measures (i.e., they are less prone to faking; Steffens, 2004) and a source of considerable controversy (e.g., Arkes & Tetlock, 2004).

The most well studied implicit prejudice is implicit racism (e.g., McConnell & Liebold, 2001; Son Hing, et al., 2008), although research has been undertaken to explore other prejudices including sexism, homophobia, and ageism (e.g., Banaji & Greenwald, 1995; Banse, Seise, & Zerbes, 2001; Cesario, Plaks, & Higgins, 2006). Generally, research exploring implicit prejudices has found that the majority of individuals demonstrate implicit prejudice, and that implicit prejudice rarely correlates with explicit prejudice (e.g., Nosek, 2007). However, implicit prejudice have been found to be uniquely related to automatic behaviours (e.g., Latof & Vaes, 2012; McConnell & Liebold, 2001; Ziegert & Hanges, 2005), contributing beyond explicit prejudice to the prediction of observed behaviour.

Teaching anti-prejudice for prejudice reduction

The teaching anti-prejudice occurs in many universities in Australian and internationally. For example, stereotypes, prejudice, and discrimination are widely taught topics in undergraduate social psychology units, and all accredited psychology programs taught in Australia require the topics of intercultural diversity and indigenous psychology to be taught (Australian Psychology Accreditation Council, 2010). However, the efficacy of such programs to reduce prejudice is rarely assessed. The few studies which have explored the efficacy of anti-prejudice programs, including diversity programs, suggest there is limited empirical evidence for that these programs do, in fact, reduce prejudice, although there is some evidence for their effectiveness in increasing awareness of prejudice and even white privilege.

Psychological research has found inconsistent results for the efficacy of anti-prejudice programs as tools for prejudice reduction. For example, one study found that the completion of a unit in which diversity or prejudice was a topic of study did have a positive effect on the perceptions of minority students compared to student who had not commenced or completed such units (Hogan & Mallot, 2005). However, these findings also revealed that components of prejudice were differentially affected by the completion of this unit. Specifically, while students reported lower levels of denial (e.g., discrimination is a problem of the past), no persistent effect was found for resistance to intergroup contact or intergroup antagonism (Hogan & Mallot, 2005). Another study using a pre- and post-test design to explore the effectiveness of a 15 week unit on the psychology of race and gender including prejudice and racism found that, while student's support for affirmative action and awareness of white privilege increased following the unit, prejudice towards various racial groups was either unchanged or increased (Case, 2007).

Finally, the teaching of diversity topics in psychology has been found to have no positive effect on the teachers of these topics (Boysen, 2011). Specifically, a survey of psychology educators revealed that the multicultural awareness required to manage the sensitive teaching of these issues were a property of individuals, and were not acquired via the teaching of these unit.

Taken together, the findings of studies examining the effects of anti-prejudice teaching in psychology units is not particularly consistent with the overwhelming conclusion that these units do not lead to reduced prejudice for students or increased multicultural awareness for staff. In effect, these units are not a good approach to teaching anti-prejudice for prejudice reduction.

There are fields beyond psychology which have embraced teaching of anti-prejudice for prejudice reduction. For example, there is a growing literature in the field of nursing which suggest nursing educators are introducing programs including elements either anti-racist or a multicultural approaches (e.g., Nairn, Hardy, Parumal, & Williams, 2004). However, while these issues are of considerable interest to nursing educators, the most recent literature reveals a focus on educators approach and conceptualisation of the issues rather than on the efficacy of the enterprise (e.g., Nairn, Hardy, Harling, Parumal, & Narayanasamy, 2011). Plausibly, where these programs are similar to psychology programs (e.g., lectures and tutorials on topics of race, gender etc.), they will also be plagued by limited prejudice reduction.

New approaches to overcome limited efficacy of anti-prejudice teaching

In their recent review of approaches to teaching anti-prejudice, Pedersen and colleagues (2011) described 14 mechanisms for reducing prejudice which might enhance the efficacy of traditional approaches. The first of these approaches resembles the traditional approach of introducing students to new information about minority groups, however, their approach emphasises dialogue rather than instruction with the dispelling of fallacies and myths the main aim of this approach. In fact, it is this difference in emphasis that characterises each of the proposed mechanism which essentially attempts to place the student in control of their learning by way of largely self-motivated, respectful discussion of the issues of prejudice and discrimination. This approach addresses one of the main impediments to anti-prejudice reduction, namely, students' failure to engage with anti-prejudice information in a way that facilitates personal change and, thus, reduces their prejudice. However, many of the mechanisms discussed may be difficult in a classroom setting because of the highly personal nature (e.g., freely expressing and discussing fallacious beliefs about racial groups or notions of white privilege) or because class sizes would make such discussion difficult to manage, especially under the guidance of less expert tutors.

Adams, Edkins, Lacka, Pickett, and Cheryan (2008) present a simple alternative to the traditional approach to anti-prejudice teaching by adopting a systemic, rather than personal focus in a tutorial on stereotypes, prejudice, and discrimination. This approach begins by demonstrating an implicit racism measure, and then discussing individual, institutional and systemic sources of stereotypes, prejudice, and discrimination. Using this approach, Adams and colleagues found that students who completed the systemic tutorial demonstrated greater awareness of systemic racism and were more supportive of antiracism policies than students in the personal focus (i.e., traditional) tutorial, or those who did not complete a tutorial on the topic. In contrast to Pedersen and colleagues (2011) mechanisms, it seems likely that Adams and colleagues approach facilitated engagement with the topic by reducing personal responsibility and, as a consequence, potentially limiting personal prejudice reduction.

Together, the new approaches highlight the positive consequences of both engaging individual and reducing personal responsibility in anti-prejudice teaching for prejudice reduction. However, these approaches have not been used in conjunction. Furthermore, the strengths and weaknesses of these approaches make them differentially useful in the tertiary teaching environments. As a result, I happily accept Pedersen and colleagues (2011) conclusion that "one discipline does not have all the answers" (p. 46), and willingly offer one further approach to anti-prejudice teaching for prejudice reduction.

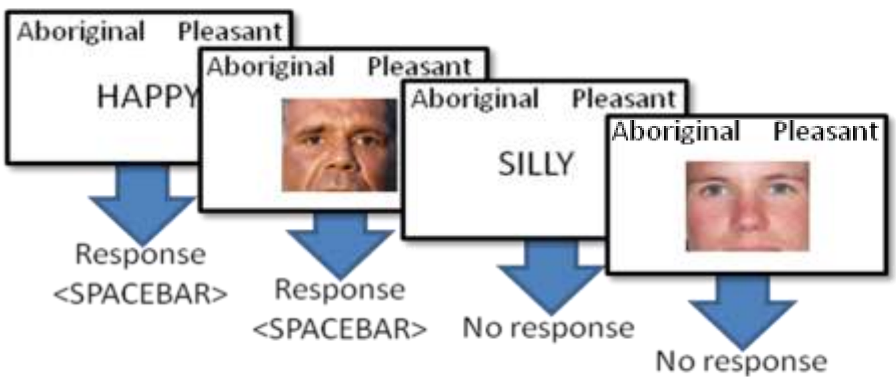
The GNAT as a New Technology for Teaching Anti-Prejudice

The GNAT

The Go/No Go Association Task (GNAT; Nosek & Banaji, 2001) is a stimulus compatibility, shared response method which measures implicit associations between a single target category (i.e., FRUIT) and a single attribute (i.e., GOOD) by assigning both targets to a single response (i.e., "go"). As a result, participants sort targets, to which they make a response, from distracters (e.g., a second category and attribute) to which they make no response. Consequently, the GNAT is simple, transparent once explained, and robust to method effects making it one of the best solution to several key issues in implicit measurement (e.g., De Houwer, Teige-Mocigemba, Spruyt, & Moors, 2009).

The GNAT is capable of measuring implicit prejudice (described previously) as the differential negative versus positive implicit evaluation of racial group (e.g., Aboriginal Australian). Thus, to measure implicit racism towards Aboriginal Australians, participants would be asked to respond to pictures or words that are presented very quickly on a computer screen that belong to either a category (e.g., Aboriginal Australian) or an attribute (e.g., pleasant) using the spacebar (see Figure 1). They would be asked to make no response to pictures or words that belong to any other category (e.g., Caucasian) or attribute (e.g., unpleasant), which would disappear after approximately 750 ms. The accuracy with which this task is performed is then compared to the performance for a block where the participants respond to the category (e.g., Aboriginal Australian) and the opposite attribute (e.g., unpleasant). Greater accuracy, as previously stated, is interpreted as greater stimulus compatibility and, in the case where performance for the category and negative pairing is better than the category and positive pairing, implicit prejudice.

Aboriginal – Pleasant block



Aboriginal – Unpleasant block

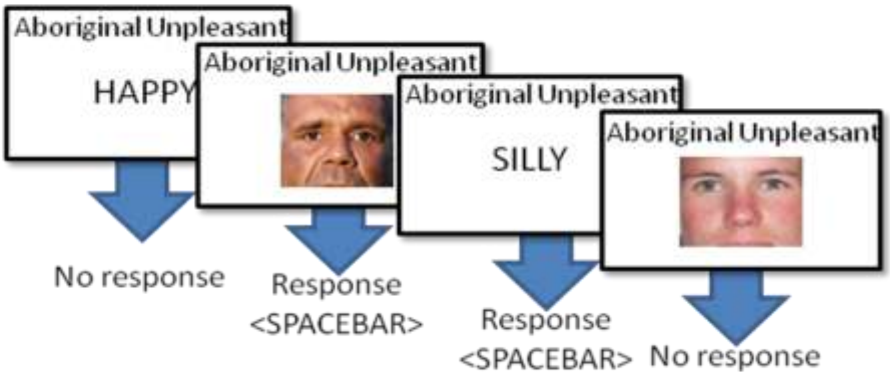


Figure 1: Screenshots of four trials with correct responses in the two implicit racism GNAT blocks

At the conclusion of the two-block (i.e., positive and negative evaluations) GNAT, participants can be provided with a summary of their performance. Specifically, they can be given feedback on their accuracy for each block, either a difference score comparing the accuracy for each block, or an overall summary for each block based on their performance (see Figure 2). This allows instructors to tailor the level of feedback to more or less knowledgeable participants.

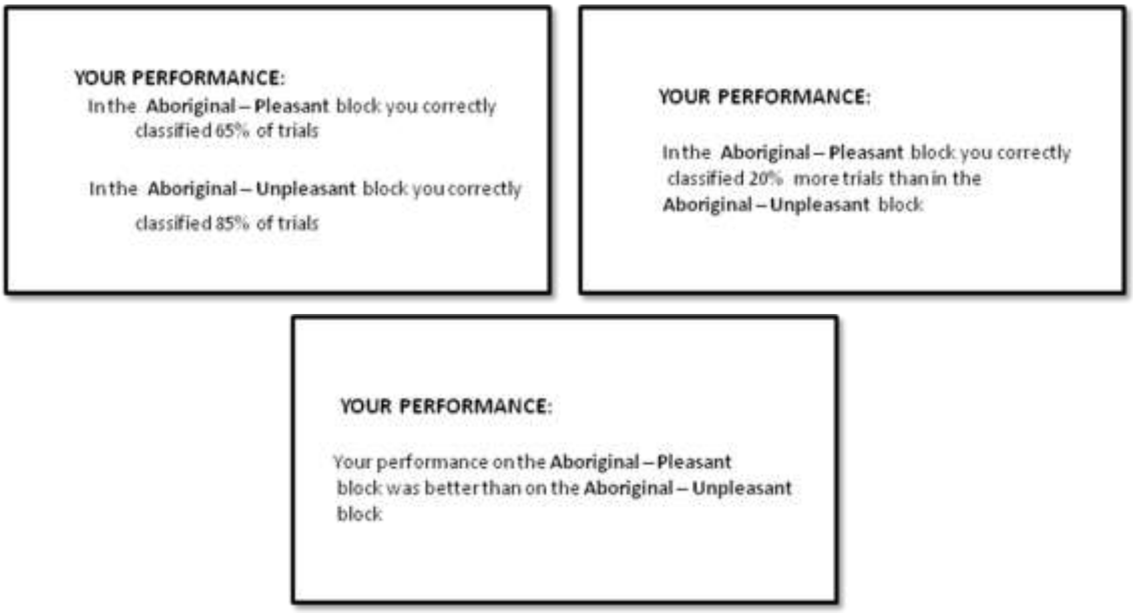

Figure 2: Screenshots of three alternative forms of feedback

Following feedback, participants can also be given generic interpretation information to assist them to interpret their results (see Figure 3). This information has the potential to ameliorate the negative experience of receiving information which is likely to be at odds with the desired outcome (e.g., demonstrating no prejudice, regardless of actual levels of prejudice) by explaining that most people have implicit biases.

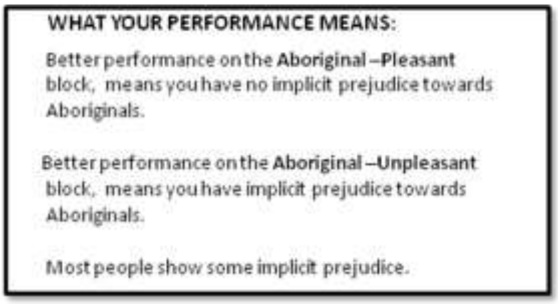

Figure 2: Screenshots of interpretation information

Using the GNAT as a technology for anti-prejudice teaching

The GNAT may be used as an approach to anti-prejudice teaching by having students complete a race-based GNAT in class, if a computer laboratory is available, or in their own time. It should be noted that there are benefits to having students complete the GNAT in the tutorial context. Specifically, they will all receive feedback at the same time which may strengthen the normative effect (i.e., most students will perform better on negative compared to positive blocks). However, some students may find this experience confronting which highlights the benefit of allowing students to complete the GNAT in their own time. The drawback of this option is that, if they receive feedback that they have demonstrated implicit prejudice, they may feel uncomfortable or angry and will have to wait until their tutorial to be guided through this experience.

Once students have completed the GNAT and received their feedback, they will have several personally relevant experiences to reflect on and share in relation to prejudice. First, they will have their feedback, and the feedback that it is typical for people to demonstrate some implicit prejudice. In addition, they will have the palpable experience of the difficulty of pairing positive words with an out-group (Greenwald, Nosek, & Sriram, 2006). This is, in fact, one of the greatest strengths of measures of implicit association compared to other measures (e.g., priming where participants do not experience the relationship between the race and attribute because of the use of subliminal primes). In this way measure of implicit associations such as the GNAT create a window allowing student to observe thoughts and feelings that we cannot typically access. Moreover, these thoughts and feelings are physically experienced as a inability to act in the ways that would be explicitly chosen (i.e., responding as quickly and effortlessly to Aboriginal Australian faces and positive words using a single key as we do to Australian faces and negative words). Thus, the GNAT is ideal for the teaching of anti-prejudice because this is an experience that cannot be externalised or denied. Rather, this information comes from within the participant, overcoming the issue of denial (i.e., I am not prejudiced) which has been argued to be the first step in addressing racism (Babacan, 2008).

Some of the benefits of the GNAT as an approach to anti-prejudice teaching include the opportunity to broaden the discussion to include a more comprehensive and contemporary definition of prejudice (e.g., Son Hing et al., 2008) which includes implicit prejudice. Moreover, the experience of the GNAT provides a basis for understanding the distinction between implicit and explicit prejudice, and their unique consequences. Furthermore, the GNAT is a reliable and flexible measure of implicit associations including implicit biases (Williams & Kaufmann, 2012). As a result, this approach can be used to teach a range of anti-prejudice topics from anti-racism to anti-ageism, anti-homophobia, and even anti-religion. Further advantages of this approach, at least currently, is that is it novel and, therefore, interesting. It is administered online and takes approximately five minutes to complete, and it is both compelling (i.e., because of the palpable encounter with one's own "unconscious") and engaging.

A race-GNAT tutorial for anti-prejudice teaching

I have used the race-GNAT for teaching implicit prejudice toward Aboriginal Australians and other racial groups (e.g., people from Asia or the Middle East) for the last three years. Both tutors and I have lead these computer-laboratory based tutorials which involve the completion of at least one race-GNAT and a structured discussion and I have found that these classes are routinely among the most animated I have experienced. I begin by having students complete the race-GNAT and provide them with accuracy feedback on their performance (e.g., the first alternative presented in Figure 2) and information on interpretation (e.g., Figure 3). I do not ask students to openly report their performance report to the class, but ask all to sit quietly until all students are finished. I then begin the semi-structured discussion: Question 1 – Can you think of any methodological factors that might have affected your performance?; Question 2 – Can you think of any contextual factors that might have affected your performance?; Question 3 – Can you think of any personal factors that might have affected your performance?; Question 4 – Do you believe the feedback you received about your implicit prejudice?; Question 5 – Did you feel one block was harder than another block, and if so, why do you think this is? Finally, the discussion concludes with the presentation of the Son Hing and colleagues (2008) two-dimensional model of prejudice and a discussion of why it is important to understand both implicit and explicit prejudice (e.g., presentation biases, personal and systemic sources of prejudice, automatic and controlled behaviours). These discussions take on a life of their own and to date, I have yet to have one of these classes conclude before the end of the scheduled class time and am frequently approached by students after class who have questions or comments about the topic.

Conclusions

It was the aim of this paper to explore contemporary definitions and issues in prejudice, and teaching anti-prejudice, and introduce the GNAT as a new technology for teaching anti-prejudice. In addition, I have provided some guidelines and alternative for the implementation of the GNAT in computer-based tutorial classes. However, it is a limitation of this paper that I have only anecdotal evidence to present in favour the GNAT as a new technology for teaching anti-prejudice. This limitation is yet to be addressed, but is an important next step for this research.

(Trans) Formation through educational technologies

Therese Keane
Swinburne University of Technology

Aaron S. Blicblau
Swinburne University of Technology

Historically, the 3Rs (reading, writing, and arithmetic) have laid the foundations for student life-skills, however, to function in the 21st century, students need to embrace the 4Cs (collaboration, creativity, critical thinking and communication). Teachers need to employ a variety of educational technologies, which embrace various aspects of the 3Rs and 4Cs in their practice. This work provides a framework for teachers to practically implement the 4Cs in a transformative space so they are then able to apply the 4CS through technology by implementing this approach to their teaching. This mode of teaching prepares students with the necessary tools for the 21st century.

Keywords: Transformation, Educational Technology, Critical Thinking, Communication, Collaboration, Creativity.

Introduction

There is widespread agreement amongst educators and the general public about the importance of the traditional fundamental building blocks that underpin student learning. These skills are often referred to as the 3Rs – reading, writing and arithmetic. Traditionally considered to be the foundations of learning, nowadays, the 3Rs alone are not enough to provide students with the necessary skills needed to function in the 21st century.

Given the saturation of information and communications technology in education and industry, students' reliance on such technologies as the Internet, mobile devices, smart phones, social media and learning management systems has challenged the way teachers use these technologies in the classroom. Additionally, we need to prepare students for the future. They need to have a broader skillset than the 3Rs in order to function and contribute in the 21st century. The American Management Association, a leading body that provides services to businesses and government agencies, commissioned the Critical Skills Survey in 2010 and identified that employers want their employees to have more than the basic 3Rs. In fact, for workforce readiness in the 21st century, employers want their employees to have developed skills in the 4Cs, which are:

- critical thinking & problem solving
- effective communication
- collaboration & team building
- creativity & innovation (American Management Association, 2010)

The current work provides guidance to teachers who are leading in a technological environment of change. Employing technology in a transformative space prepares students with the necessary tools for the 21st century.

Successful learning

It has been long understood that for students to be successful learners, much more than the 3Rs is required. In developing the Taxonomy of educational objectives, Bloom's Taxonomy (1956) outlined ways of learning and thinking in a hierarchical structure. Bloom's Taxonomy defined thinking skills into six categories, namely: evaluation, synthesis, analysis, application, comprehension and knowledge. Using technology as a mode of instruction, Bloom's Taxonomy was revised in the 1990s to reflect the changes in the education landscape (Anderson et al., 2001). The revised taxonomy replaced the nouns with verbs to form the following categories: creating, evaluating, analyzing, applying, understanding and remembering. Biggs and Collis (1982) developed the SOLO taxonomy with five levels to distinguish between surface learning and deep learning. While not as hierarchical as the Bloom taxonomy, the SOLO taxonomy describes different levels of learning.

Other theories of learning such as Gardner's Multiple Intelligence (1983), and De Bono's Six Thinking Hats (1985) were developed to describe different approaches to thinking and therefore different ways of learning and communicating. Gardner's work describes how different individuals are predisposed to learning in different kinds of ways, whether they be, spatial, linguistic, kinesthetic, musical, interpersonal, intrapersonal, naturalistic and existential. On the other hand, De Bono's Six Thinking Hats, describe specific approaches to thinking with, particular application to problem solving. In contrast, Costa and Kallick (2000) identify 16 Habits of Mind which lead to successful learning. Most of these Habits are best described as psychological dispositions, which the learner brings to the task.

The mainstream use of the Internet in the 1990s along with the proliferation of personal computers has led to a great deal of discussion and debate about the effect of ICT on education and the types of thinking required for success in the digital age. One thing that is clear is that computers and networks have had a profound effect on modern society and education. This can be seen most crudely in the proliferation of 1:1 computer programs and government initiatives to provide students with computers (Rudd, Smith, & Conroy, 2007). The advent of mobile devices such as iPads© and Netbooks brings with it the ability to deliver information to students whenever and wherever they want (Johnson et al., 2011; Pohio & Falloon, 2010). According to the 2011 Horizon Report (Johnson et al., 2011), mobile devices have been embraced by schools for 1:1 programs due to their affordability and ease of internet connectivity (Morgan, 2010; Schachter, 2009).

It is in this changing technological context, that schools need to focus on more than just the basics (3Rs). For example, in the United States, the report titled "The New Commission on the Skills of the American Workforce (2006) asserted that it not only basic skills, but creativity and innovation which are essential for future economic and job security. Silva (2008) argues that "integrating 21st century skills into teaching and assessment, then, is not only an economic imperative, driven by changes in the workforce, but a vital aspect of improving learning." The necessity to ensure students acquire 21st century skills has been recognized in the Australian Curriculum (Australian Curriculum Assessment Reporting Authority, 2012). The development of the Australian Curriculum, is guided by the Melbourne Declaration (MCEETYA, 2008). According to the Melbourne Declaration, successful Learners:

- have the essential skills in literacy and numeracy and are creative and productive users of technology, especially ICT, as a foundation for success in all learning areas
- are able to think deeply and logically, and obtain and evaluate evidence in a disciplined way as the result of studying fundamental disciplines
- are creative, innovative and resourceful, and are able to solve problems in ways that draw upon a range of learning areas and disciplines
- are able to plan activities independently, collaborate, work in teams and communicate ideas (MCEETYA, 2008)

4Cs

Critical thinking is vital for problem solving. Often situations that are complex, uncertain and have no precedent require employees to solve problems. Critical thinking is the discipline of actively and skillfully conceptualizing, applying, analyzing, synthesizing and/or evaluating information gathered from, or generated by observation, experience, reflection, reasoning or communication.

Whilst students take for granted that they can communicate with others, there are various degrees of communicating effectively. To explain complex ideas, a concise, organized and measured approach is necessary.

To solve problems, students need to interact in teams. This provides the necessary social and learning environment to solve problems. Often educators underestimate the importance of working globally in virtual teams and asynchronously. As we are now heavily reliant on technology, and can use tools to assist in communicating with teams that may be dispersed internationally, collaboration and team building are necessary skills.

Creativity may be defined as *pushing the boundaries* to develop new ideas, and *innovation* is the development of these ideas into actuality. For example, though mobile phones were around for at least 20 years, the late Steve Jobs was able to convince the public in June 2007 that his new creation of the iPhone© (Isaacson, 2011) with its multi-media, touch screen, combined a number of innovative technologies such as a music player, camera, wireless internet connection, Bluetooth and *Apps*, was the mobile phone to have!

3Rs + 4Cs = 21st century skills

Technology is an important component for the development of the 4Cs. Students in the 21st century live in a technology and media rich environment where they have access to a plethora of information, new, powerful digital tools, and the ability to collaborate and communicate with others. To be effective, students need to be able to demonstrate the 4Cs in relation to an online world. It is tempting, then, to believe that the simple way to address the development of the 4Cs is by providing students with computer devices. Certainly there has been a good deal of government policy that has been based on the assumption that access to technology is the key to achieving success. However, simply providing students with mobile devices such as netbooks, iPads©, tablets, and laptops will not develop these skills and enhance their learning. What the teacher does in the classroom with these devices is important for improved student outcomes.

There are those groups like Partnership For 21st Century Skills - a national American organization - that promote the importance of 21st century readiness for every US student. They fuse the 3Rs and the 4Cs, and provide resources and tools for these skills (Partnership for 21st Century Skills, 2012).

A framework for technology adoption

According to Puentedura (2011), the SAMR Model for technology adoption, divides technology usage into four distinct level as seen in Figure 1. In this model, *substitution* is the lowest level of technology usage where it is used to simply replace whatever was being done without that technology. For example, a word processor – without the use of enhanced features for editing - is used as a substitute for pen and paper. At the next level, *augmentatio*n is where the technology acts as a direct tool with some functional improvement, following on from the previous example, the use of sophisticated editing functions are used is this level. For example, the difference between *substitution* and *augmentation* is the use of features to improve the product. However, only basic learning skills take place. These two levels of technology use are defined as the *enhancemen*t stage.

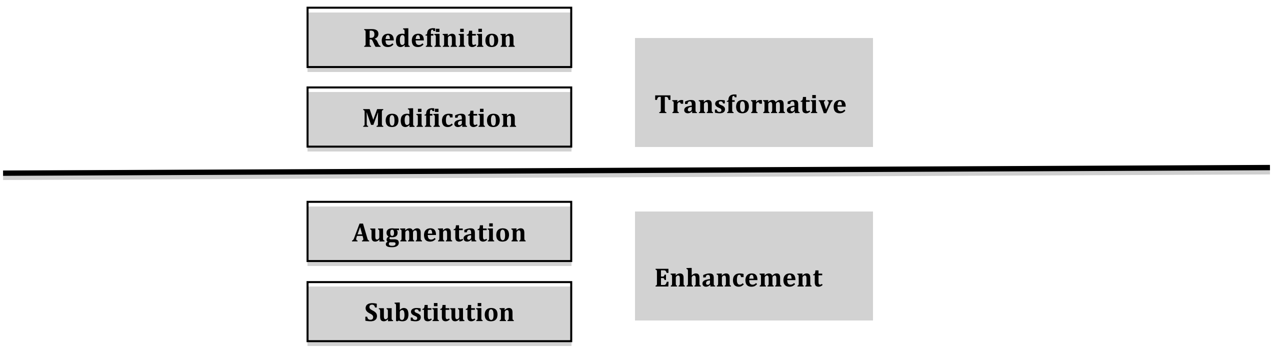

Figure 1: SAMR Model for Technology Adoption (Puentedura, 2011)

Whereas, in the *enhancement* stage, the task could have been completed satisfactorily without using technology, at the *modification* level the task becomes something quite different. So that rather than complete a word-processed piece to be printed out, the writing becomes part of a blog, wiki or social network exchange. The final level of *redefinition* is where the technology allows for the creation of new tasks previously inconceivable. This final level is difficult to describe as we are constantly redefining what is possible using technology in advance forms. These two levels, *modification* and r*edefinition* are identified as the *transformative* stage. It is proposed that teachers use the higher levels of the SAMR model in relation to technology adoption as their framework to improve student outcomes. The SAMR framework provides a dialogue to frame a discussion around teaching achievements and future directions.

Effects on learning

The possible effect on learning is mitigated when technology is only used in the *enhancement* stage (Herrington, Herrington, Mantei, Olney, & Ferry, 2009). Student mastery of the 4Cs happens when we operate in the *transformative* stage, which provides ideal learning conditions to be deployed. According to Oostveen, Muirhead & Goodman (2011), “It seems that meaningful learning is far more likely if the new technologies are recognized as providing transformative opportunities.” Designing assessment tasks that require students to demonstrate their 4Cs is in alignment with the *transformative* stage in the SAMR model. What happens in the classroom with technology usage in schools occurs at the *enhancement* rather then *transformative* stage. Therefore we need to provide the appropriate situations that will allow students to develop a mastery of the 4Cs. Hattie (2009) argues that “It is what teachers get the students to do in the class that emerged as the strongest component of the accomplished teachers’ repertoire, rather than what the teacher, specifically, does. Students must be actively involved in their learning, with a focus on multiple paths to problem solving” (p. 35).

Concluding comments

If the teachers’ use of digital tools is confined to word-processing, emailing and researching the Internet, then it is little wonder that students do not have a broader skill set. To prepare learners for the future, schools need to cultivate higher levels of teachers’ professional learning and so extend the students’ development of the 4Cs. Professional development needs to focus on what teachers can get their students to do, so that the use of technology can help students confidently master the 4Cs. Future work will focus on determining the effectiveness of implementing the 4Cs for teacher professional development and evaluating student outcomes in a technological transformative environment.

Designing evaluation and research into educational initiatives: the Global Perspectives Program

Jo-Anne Kelder
University of Tasmania

Juliet Sondermeyer
University of Tasmania

Rob Phillips
Murdoch University

Anne Rothwell
University of Tasmania

We describe the planning for evaluation research using a curriculum initiative project as a case study. The project was to design a generic *Global Perspectives* (GP) learning program to embed in first year units of study offered by the Faculty of Health Science. The pilot phase of the GP program delivery was used to explore and define an educational evaluation research (EER) plan that addresses, 1) the GP program design; 2) its implementation and ongoing refinement and, 3) the management of the project. The GP program is presented from an e-learning design perspective and its EER plan is based on the design framework in (Phillips, McNaught et al. 2012). The paper provides a high level view of the EER plan for the GP program over each stage of the design life cycle and for the evaluation of project management. The paper discusses the rationale for an EER plan, the book as a guide for research and practice in evaluating e-learning and the relationship of the GP program to learning, teaching and leading for the future.

Keywords: e-learning program evaluation, project-management evaluation, evaluation research design

Introduction

The focus of this paper is the design of a systematic plan for educational evaluation and research (EER) aligned with the design, delivery and management of a curriculum initiative: to teach a generic graduate attribute to first year students. The *Global Perspectives* (GP) program is designed to support first year Faculty of Health Science (FHS) students from the University of Tasmania (UTAS) to learn and demonstrate the 'Global Perspective' or 'cultural competence' graduate attribute. The context of the EER plan is nationally regulated higher education and a future environment where evidence of quality learning experiences and learning outcomes are expected with, "Course and discipline-specific skills and knowledge, as well as the generic skills developed through higher education will be considered by TEQSA when reviewing learning standards" (Tertiary Education Quality and Standards Agency 2011, p.7). It presents the plan for evaluating and researching the design, implementation and improvement of the GP program. The intended outcomes are evidence-based improvements to the GP program design and a reliable and valid evidence base for demonstrating learning outcomes and usefulness of resources. The tight integration of educational evaluation and research informing the ongoing design and re-design of a learning program increases confidence that students are equipped for future roles in a global society.

The paper begins with the policy and strategic environment driving the project. It provides an introduction to the concept of graduate attributes, and the 'global perspective' (or 'cultural competence') attribute. Cultural competence was identified as a critical attribute for FHS graduates training for clinical professions. The GP program built on prior curriculum initiatives, directed at students unfamiliar with Australian culture, to prepare them for clinical professional experience placements and interactions with clients. The expanded vision for the future is the GP program as a compulsory, assessable component of curriculum to ensure, "Cultural competence for life-long learning and work in a global society" for *all* students. The paper presents the GP program from the perspective of e-learning design and describes the rationale for developing an EER plan based on (Phillips, McNaught et al. 2012). The paper presents the EER plan, developed in the context of the 2012 Ascilite mentoring program, and comments on the book as a guide for research and practice in evaluating e-learning.

21st century learning environments and UTAS

Increasingly, universities are providing blended learning environments to support flexible access to learning opportunities for students. UTAS is a multi-campus university and the FHS provides a number of courses fully online and in blended delivery mode to students at the Hobart, Launceston, Cradle Coast and Sydney campuses. However ensuring high-quality learning experiences in an online environment requires strong pedagogical design as well as good technical design of e-learning artefacts and environments. UTAS has adopted a Technology Enhanced Learning and Teaching Action Plan (CALT 2011), invested in a new Learning Management System (LMS) and adopted a "Minimum Online Presence" requirement for all courses. UTAS is developing a Learning and Teaching Evaluation policy with associated Course Review Procedures and Course Review Guidelines to embed continuous evaluation and review of Unit and Course designs (UTAS 2012).

Educational Evaluation and Research

E-learning evaluation is a complex mixture of evaluation and research requiring a systematic and planned approach to ensure rigor and relevance (Phillips, McNaught et al. 2012). It benefits from a mixed methods, or hybrid, approach because, "'appropriate' assessment of curricular innovations is an *argument* that includes diverse kinds of scientific evidence, as well as the theoretical rationale and the social significance of the innovation" (Ruhe and Boudreau 2011, 188). Benefits of designed evaluation include opportunities to improve program design; communication between project team members; identifying additional/alternative types of data to collect, reviewing evaluation procedures, and preventing misunderstandings including with those with oversight of the project (Sanders and Nafziger 2011[1976]).

Phillips *et al* (2012) argue for, "an evaluation framework and a scaffolded approach to the design of an e-learning research study" (2012, p.13). The authors provide a holistic, systematic and planned approach to educational evaluation and research which, "explicitly maps evaluation-research activities to the design-and-development cycle of an e-learning artefact, and applies across many, if not all, of those development phases" (2012, p.87). The book distinguishes four interrelated, and potentially concurrent, evaluation-research activities: *baseline analysis, design evaluation, formative evaluation* and *effectiveness research* with *project management evaluation* as a separate, related, activity. Project management evaluation is about the conduct of an e-learning project, primarily formative and concerned with processes although summative elements, for example in reporting to funding bodies (Phillips, McNaught et al. 2012).

Graduate Capabilities and Cultural Competence

Graduate capabilities are also referred to as competencies, generic skills, graduate attributes and 21st century skills. These are the skills required to be successful knowledge workers and citizens, and they combine with subject-based knowledge to produce the 'expertise' of a graduate (Bransford, Brown et al. 1999). Allan (1996) distinguishes between *personal transferable outcomes* (acting independently, working with others, using information technology, communicating effectively, organisational skills, etc.) and *generic academic outcomes*, (making use of information, thinking critically, analysing, synthesising). A further distinction is between these personal skills and abilities, and complex interwoven aspects of human ability, which are difficult to explicitly teach or assess in traditional university experiences (e.g. Independent and lifelong learning, Ethics, Social justice) (Barrie 2005).

The UTAS *Global Perspective* graduate attribute is, "Graduates will be able to demonstrate a global perspective and inter-cultural competence in their professional lives" (CALT 2001). Graduate attributes must be integrated into curriculum and evaluation/quality assurance processes, as well as support students, "in the development, assessment and documentation of the achievement of graduate attributes throughout their study" (CALT n.d.). The global mobility of graduates and multi-cultural demographic of most countries means that the ability to relate effectively and appropriately with colleagues, clients, and the community at large is a critically important attribute wherever a graduate chooses to work.

Education design for 'Cultural Competence': the Global Perspectives program

Background

The Global Perspective attribute was explicitly taught in a support program developed in the School of Nursing & Midwifery (SNM) (Spratt and Sondermeyer 2006). This program included workshops and tutorial discussions designed to prepare Culturally and Linguistically Diverse (CALD) students unfamiliar with Australian culture for clinical professional experience placement. The learning objective was to equip target students to interpret and respond in culturally appropriate ways to clients seeking health care services. Sondermeyer and Van den Berg (2005) suggested that a program for *all* students and teaching staff would significantly improve this 'deficit' model. In 2011, a faculty-wide project was established to leverage expertise in the SNM and extend the program to teach and assess cultural competence for all students, regardless of cultural background. It represents a significant shift in both target student cohort and intended scale of engagement.

Baseline analysis

The problem the GP program design seeks to address is that graduates in the 21st century will live and work in a rapidly changing global society. Capability in cultural competence, including intercultural awareness and communication skills, will determine the extent to which graduate health professionals succeed in practice environments in Australia and in other countries (Sondermeyer, van den Berg et al. 2005).

To avoid a 'deficit' model of supporting targeted students (Sondermeyer, van den Berg et al. 2005) or a 'tokenistic' approach to cultural competence, the first decision was to design a learning environment that could embed *global perspective* into core curriculum to enrich the learning experience of all students and staff. Thus the GP program is discipline-agnostic and can be embedded in any first year unit of University study.

A review of the literature on "cultural competence" (and equivalent concepts) identified four major components which informed the working definition of *cultural competence* used to frame the learning design:

> An ability to communicate/interact effectively and appropriately with people of different cultures, comprising four components:
> a) AWARENESS of one's own cultural worldview;
> b) ATTITUDE towards cultural differences;
> c) KNOWLEDGE and ACCEPTANCE of different cultural practices and worldviews;
> d) SKILLS (including COMMUNICATION).

Four learning objectives were derived from this definition:

1. Student identifies awareness of his/her own worldview in the context of other worldviews;
2. Student demonstrates a respectful attitude towards cultural differences;
3. Student demonstrates recognition and understanding of different cultural practices;
4. Student uses communication effectively and appropriately to enhance intercultural understanding.

These learning objectives are embedded in the core elements of the GP program and were the criteria for deciding content, structure, learning processes (including sequencing) and supporting resources.

GP Program Design

Table 1 sets out the components of the GP program as it was developed 2011-2012. The learning design is structured around three elements: an online *Quiz*, a face-to-face teaching *Module* and, for students who are required to participate in clinical Professional Experience Placement, a *Workshop* component.

The Module is delivered via a "plenary session" and "tutorial discussion" sequenced over four weeks with each week aligned to a Leaning Objective. It is designed to fit within the traditional structure for a Unit and utilises the timetabled lecture and tutorial slots. The learning design assumes a Minimum Online Presence on the UTAS LMS. Each plenary session is a highly interactive lecture, scaffolded by a PowerPoint presentation, which is recorded and uploaded to the Unit presence on the LMS. Additional resources are provided on the LMS including journal articles, recorded interviews and video clips that relate to each part of the Module. The tutorial discussions include reflective exercises, paired and group discussion, and focus on supporting students to apply the concepts delivered in the plenary session to their personal and professional/disciplinary context. The Quiz is designed to provide students an opportunity to respond to a number of questions and scenarios for which a variety of responses or interpretations of 'what is going on' are possible. It is administered in the week before the first plenary session via a link on the LMS. It also provides a shared experience for students to use to respond to questions in the plenary session and begin discussions in the tutorial.

Table 1: Global Perspectives program

Components	Purpose	Delivery mode	Delivery sequence
Quiz Not assessed	- (self)-'consciousness raising' Conversation scaffold for Module.	Online - Via link on LMS - Voluntary and anonymous	- Administered prior to Module - Students notified via LMS email
Module Four instances of **plenary session** (with follow-on **tutorial discussion** Assessed - Exam	Module – 4 learning objectives (LOs) - content related to an LO for that part of the Module - discussion and exercises to consolidate and apply the LO to personal and professional practice	Face to Face - whole of student cohort interactive plenary session - small group tutorial discussion (25 max) Online via Unit LMS - plenary session recorded and uploaded to LMS.	- Plenary session – one hour per week for four weeks - Tutorial discussion – one hour per week for four weeks
Workshop - Component of a compulsory two hour PEP workshop	Preparation for students' Professional Experience Placement	Face to Face - GP content for workshop is 30 min	- Delivered in following semester

The lifecycle of the Global Perspectives program

The concept of 'life cycle' for an e-learning artefact or environment is grounded in the inescapably 'designed' nature of learning in online environments; it is also a scaffold for the evaluation research framework presented in (Phillips, McNaught et al. 2012), Figure 8.1, p. 119. The development cycle of an e-learning artefact or environment has four phases: *analysing the requirements*, *specifying design*, *development* and *implementation* and each phase in the life cycle suggests a focus for evaluation and research (Phillips, McNaught et al. 2012).

The focus, or unit of analysis, for e-learning evaluation tends to be the design of an artefact (which will later be embedded into a learning environment). However, the orientation of the GP program design is curricular, not artefactual; thus some of its design phases do not neatly align with the phases in (Phillips et al 2012). The GP program, in its current form, is a learning environment that is delivered in blended mode. Face-to face teaching and peer interactions are assumed critical to the development of students' cultural competence capability.

The project plan compasses three phases of activity: pilot implementation (phase one, Semester 1, 2012), implementation (phase two, Semester 2, 2012) and faculty-wide roll-out (phase three, 2013). Phase one was preceded by an extended period of research and consultation to produce the GP program design (phase 0). The GP program, in its final form, will be housed in an online environment from which a variety of learning and teaching resources will be available for downloading and embedding in any Unit of study. This implies an additional design activity beyond the current project plan (phase four, 2014): the GP program, and documentation to guide teaching and learning practice, for use in contexts not supported by the project team.

Phase 0 – GP program design (to solve the problem of how to build cultural competence)

The requirements analysis and initial design for the GP program took place during late 2011 up to May 2012. Initial inputs to the GP program design (see Table 1) included: Sondermeyer's workshop design; definitions, learning objectives and learning designs sourced from a range of literature in the cultural competence and internationalisation domains and the collective experience and knowledge of project team members. A three day consultation with Dr Darla Deardorff, Dec 2011, provided expert information and advice based on current scholarship and practice of educating students in 'cultural competence'. A key learning design decision from the consultation was to first establish learning objectives for the assessment of cultural competence and apply them to the Quiz and Module components of the GP program (Table 1). The next step was designing learning activities for the learning objectives. Working parties were formed to develop the Quiz, Module and Workshop elements of the GP program. Working parties presented their learning designs to the project team for discussion and the team decisions on what should be added or changed incorporated into the learning design.

Phase one – pilot implementation

The pilot implementation of the program was delivered in the last five weeks of Semester one, 2012 to approximately 500 first year Bachelor of Nursing students enrolled in CNA116 *Introduction to Nursing.* The pilot implementation was used to trial data collection tools and to develop the preliminary EER plan to guide the evaluation of the GP program.

Phase two – implementation

In phase two, semester 2, 2012, GP program was revised, based on evaluation of phase one, and embedded in a first year Unit delivered to approximately 55 first year Bachelor of Pharmacy students. First year BN students participated in a Workshop prior to Professional Experience Placement (PEP), to reflect and discuss how to apply the learning from the GP program in a clinical context. Students attended focus groups post-PEP to “de-brief”. Training workshops were designed for UTAS staff members, new to the GP program, planning to embed it in a Unit in phase three. Work began on a fully online version of the GP program for distance students.

Phase three – FHS roll-out

In phase three, semester 1, 2013, the revised, predominantly face-to-face GP program will be embedded in a Unit taken by all first year medical students; an online version will be embedded in a Unit undertaken by first year Bachelor of Paramedic Practice students. Other Schools in the Faculty will also have opportunity to embed the GP program in their first year Units. Preliminary design for a GP program for embedding in second and third year Units will begin.

Phase four – GP program available online *for embedding in first year Units*

In addition to the planned rollout of the GP program for all first year courses in Faculty Health Science Schools, it is envisaged that both face-to-face and online versions of the GP program will be made available for Unit Coordinators to embed within Units in other Schools and disciplines across UTAS. The design of the GP program, as developed in phases one to three, assumes the project team members either deliver the program or provide hands on support and training to those who embed the GP program in their Unit. Phase four will initiate a significant shift in the design focus: to the GP program as a standalone online resource that can be downloaded, embedded in a Unit, and delivered without support by the project team.

Planning and implementing Educational Evaluation and Research

EER plan principles and foundations

The EER plan for the project has two foci: evaluation of the *project* (plan, structure, processes) and evaluation research of the project output – the *GP program*. The project evaluation is discussed first, summarised in Table 2. The GP program evaluation is presented in the following section and summarised in Table 3.

The broad aim of the EER plan is to conduct formative and summative evaluation of the GP program design and implementation. Particular goals are to:

- evaluate the process and outcomes of the project in order to make recommendations for the management and design of future educational projects;
- improve the educational design of the GP program;
- evaluate the effectiveness and impact of the GP program on student engagement and student learning;
- evaluate the staff experience of delivering the GP program;
- determine if, and to what extent, the GP program produces a ‘cultural shift’ in participating students and staff members.

The project structure includes an EER working party whose remit is to design the EER plan and to support project team members, individually or in groups, to engage in a program of educational evaluation and scholarly research aligned with the plan. The EER plan includes: overarching research questions, data collection instruments, data analysis methods and suggested publication and reporting targets. Some of these elements are not yet fully developed; most will change and adapt over time as the project progresses.

The EER plan is based on the evaluation-research process in (Figure 7.1, Phillips et al 2012) and uses the planning tools it provides for managing the change in focus required over time as a design-based learning project evolves to a mature system. Table 3 maps the phases of the project to the e-learning life-cycle and identifies the evaluation-research elements for each stage.

Project Management Evaluation

The EER plan focuses on formative project management evaluation throughout the project; summative evaluation will be conducted at the end of the project. Table 2 summarises the core elements of the project and its characteristics as set out in the project plan submitted with a successful UTAS Teaching Development Grant application. Project management evaluation is best concerned with formative evaluation of project processes with outcomes addressed by other evaluation-research activities (Phillips, McNaught et al. 2012). Two lines of formative investigation are: 1) the effectiveness of the project structure (particularly working parties developing learning designs for review by the project team) and 2) the effectiveness of project processes. The criteria for measuring effectiveness is, *To what extent are project outputs meeting stakeholder needs?* The final project report and FHS's desire to use the project as a blueprint for similar educational initiatives suggests a broad research question, *What was the overall success of the project, including its impact on stakeholders, and how can the process be improved?* The project structure and processes were explicitly designed to ensure a planned and holistic approach to EER. This suggests a further research question, *What is the impact of designing and planning educational evaluation research into the project?* A formative and summative evaluation process will also used to evaluate the effectiveness and impact of designing and planning educational evaluation research into an (e)-learning project.

GP Program: Educational Evaluation and Research (EER) plan

The development and implementation of the GP program is planned over five phases: 0: *Design*; one: *pilot implementation*; two: *implementation*; three: *FHS roll-out* and four: *online version* for embedding in Units. The EER plan for the GP program covers phases one through three with indicative comments for phase four.

Table 3 is based on the assumption that evaluation and research goals need to align with different life cycle stages of a learning design. Research goals and broad research questions for each phase of the GP program were selected by mapping the development and implementation phases to the life cycle phases of an e-learning project in (Phillips, McNaught et al. 2012); identifying type of activities (analysis, design, develop, implement) and EER questions for the evaluation research focus appropriate for that phase.

Table 3: GP program life cycle: adaptation of Tables 8.1 & 8.2 (Phillips, McNaught et al. 2012)

GP Phase	Cycle	Analysis	Design	Develop	Implement	Questions to ask	Evaluate – Research
0	0	Analysis of problem				What is the problem and how can we solve it?	Baseline analysis
0	1		Design e-learning environment	Document-ation		How good is the design?	Design evaluation
1	2		Refine design	Develop e-learning environment	Initial trial	How can the e-learning environment be improved?	Formative evaluation of the e-learning environment
2	3	Refine problem analysis	Refine design	Revise e-learning environment	Deploy to learners (full trial)	How well does the e-learning environment work to support cultural shift?	Formative evaluation of the e-learning environment and processes
3	4	Refine problem analysis	Refine design	Revise e-learning environment	Deploy to learners	How effective are the learning processes in generating 'cultural shift' in students? What is the impact on students' capabilities in managing cultural diversity?	Effectiveness research into learning processes and outcomes
4	5	In phase four, the GP program will be designed as an online teaching resource with accompanying teaching training materials to support delivery. This will begin a new design phase and the EER focus will return to the characteristics of phase 0, cycle 0 for the GP program.					

EER phase 0 – baseline analysis and design evaluation
The focus of design activity in phase 0 was analysis of the problem, *How to build cultural competence in first year students?* The focus of EER during this phase was research to identify potential design solutions and to evaluate their potential as a learning environment. An external consultant provided advice and guidance on the learning objectives for the GP program. Once a coherent design was formulated, the focus shifted to the evaluation question, *How good is the design?*

The method for evaluating Quiz and Module designs was that working parties would present their proposed designs for review and discussion by the project team. The criteria for evaluation were: 1) content alignment with the Learning Objectives and 2) impact on learners of Quiz and Module learning design.
Several iterations of team-based discussion resulted in significant design changes to the Module and Quiz.

The Module was trialled with two cohorts of students from another institution. Feedback forms, with questions on the content and delivery experience, were collected from participants. The data was analysed by the Module working party to identify design aspects that needed changing. The Quiz design was trialled by the 20 plus members of the project team and the design evolved significantly. Its planned purpose of 'diagnostic tool' to measure the impact of the program on students was changed to a 'consciousness raising' and 'fun' activity for students to participate in, and as a prompt for tutorial discussions.

EER phase one – design evaluation and formative evaluation of the e-learning environment
Phase one and phase 0 overlap in terms of life cycle. The broad research question for phase one was, *How good is the design?* and subsequently, *How can the design be improved?*

EER for these phases was evaluation for improving the GP program design. The project team monitored student comments about the GP program on the LMS blog for the Unit. The UTAS Student Evaluation Teaching and Learning (SETL) Unit survey included questions specifically about the GP program embedded in the Unit. This data was used to evaluate the pilot delivery of the GP program. The analysis of student comments and SETL data was done by working parties who then proposed design changes to the project team for discussion and approval. Members of the project team attended the Module plenary sessions and tutorial discussions as observers. Additional data included: project meeting minutes (recording post-observation feedback), observation field notes, and emailed feedback comments.

At the conclusion of phase one, the GP program was evaluated from both student and staff perspectives and revised and refined for phase two delivery. During phase one, the EER working party developed a diagnostic tool for measuring the GP program's impact (or 'cultural shift' in knowledge, skills, capabilities) on individual students. The *My Perspective* questionnaire was trialled in phase two and evaluated for validity and usefulness.

EER Phase two – formative evaluation of the e-learning environment
The focus of phase two was the design of the GP program as a learning environment. The broad research questions for phase two were, 1) *Does the learning environment work as intended?* and 2) *How can it be improved?*

Phase two data collection added student focus groups and student assessment items as data sets. To determine effectiveness and 'impact' on student learning from the GP program a long-term plan was initiated to develop, trial and validate a diagnostic tool to answer the question, *How well does the GP program as learning environment support 'cultural shift'?* The *My Perspective* questionnaire was administered pre- and post- Module (during the first plenary session and again, at the conclusion of the last tutorial discussion). This tool was explicitly aligned to the GP program learning objectives and sought to elicit the students' perceptions of their personal curiosity, comfort, confidence with other cultures and their understanding of their worldview. A second diagnostic tool is being designed and validated to establish a baseline of cultural competence that is not explicitly aligned to the GP program learning objectives and capable of establishing a baseline of 'cultural competence' for first year students and to validly assess the effectiveness and impact of the GP program.

During phase two, the Nursing students participated in a Professional Experience Placement Workshop. This workshop incorporated a 30-minute component designed by the GP program Workshop working party to revisit and apply the learning objectives of the GP program to practice in a clinical setting. As for the Module and Quiz, the Workshop is evaluated from a design perspective, *How good is the design and how can it be improved?* Student feedback data from the Workshop and post-PEP focus groups will be analysed to identify and trial specific research questions and data collection methods to measure the impact of the GP program on students' cultural competence capabilities in clinical professional experience placement settings.

The literature review was updated and focused on 'cultural competence' as a construct and scholarship and practice in tertiary education learning design. At the conclusion of phase two, analysis of data (student and staff perspectives) was conducted from an educational evaluation perspective. Data was interpreted within the framework of learning design principles synthesised from the literature review. The various data collection methods and data sets were also interrogated to assess their ability to establish a baseline of student knowledge, skills and capability in cultural competence and to measure cultural shift in response to achieving the learning objectives of the GP program.

EER Phase three – formative evaluation of the e-learning environment and processes and effectiveness research into learning processes and outcomes
The GP program design will ultimately be finalised for large-scale delivery in phase three. In this phase, the focus of the EER plan is researching how learners engage with the GP program as a learning environment. The broad research questions identified for phase three are: 1) *How well does the GP program as a learning environment support learning?* 2) *How effective are the learning processes in generating 'cultural shift' in students?* and 3) *What is the impact on students' capabilities in managing cultural diversity when on Professional Experience Placement (PEP)?*

On the basis of the pilot implementation (phase one) and implementation (phase two), the EER working party will develop or identify a range of instruments to facilitate and guide ongoing evaluation of the GP program. The design and content of additional data collection instruments (for example survey/questionnaire, student focus groups, interviews) will be decided based on the data analysis and outcomes from phases one and two of the project. Standardised questions for students to evaluate the GP program, as embedded in their Unit, will enable summative evaluation of the Quiz, Module and Workshop design and the effectiveness of delivery from student perspective for each Unit. The *My perspective* questionnaire and cultural competence diagnostic tool will be evaluated for validity in establishing a baseline and in determining if the intended learning outcomes / objectives have been demonstrated by a measurable cultural shift in students' capabilities.

Phase three will test the sustainability of the GP program's design: *Is the GP program design sufficiently clear and robust to be delivered independently of the project team?* and *How effective are the training and teaching resources provided?* A feature of the GP program is the requirement for skill in a highly interactive teaching style for delivering the plenary sessions, in contrast to 'lectures' whereby teachers talk and students listen, and skill in facilitating tutorial discussions of sensitive topics that can produce strong emotions. Hence the GP program design will include teaching materials and training for academics intending to embed the program in a first year Unit.

The EER working party will oversee and monitor any evaluation and research projects that are proposed by members of the project team who wish to investigate specific aspects of the GP program as it is implemented during phase three.

EER Phase four – effectiveness research into learning processes and outcomes (mature GP program) and baseline analysis and design evaluation (GP program as online resource)
The approach to evaluating and researching this stage of the GP program life cycle will be developed in the EER plan in more detail during phase three when the GP program is evaluated as a mature system. The focus of evaluation of the mature GP program design will be effectiveness research into learning processes and outcomes, emphasising demonstrated achievement of learning outcomes. This phase will revisit the design evaluation to determine if the learning environment embodied in the GP program is consistent with the baseline analysis of educational need and learner characteristics and if it is achieving the intended learning objectives (Phillips, McNaught et al. 2012). Additional data will include peer review on the final learning design of the GP program as it is embedded in Units and taught by academics independently of the project team.

Evaluation-research activities for the GP program as an online resource will be framed by e-learning design principles explicated in relevant literature on e-learning best practice. The baseline analysis of the problem, *How to build cultural competence in first year students?* will be adapted to include teacher and learner characteristics for an online delivery mode. The focus of EER during this phase will be to identify potential design solutions and evaluate their potential as a learning environment. Once a coherent design is formulated, the focus will shift to the evaluation question, *How good is the design?*

Guidance for research and practice in evaluating e-learning

This paper had its genesis in Ascilite's community mentoring program. The intended outcome specified in the mentoring agreement between the first author and mentor, Phillips, was for the novice researcher in e-learning to develop skills in EER and to apply the evaluation research framework provided by (Phillips, McNaught et al. 2012) to a project involving e-learning design.

This section is a short account of (Phillips, McNaught et al. 2012) as a guide for research and practice when evaluating e-learning. The context of this account is the project effort thus far to design and evaluate the GP program as well as plan for future evaluation and research activities. The book presents a strong case for, "an evaluation framework and a scaffolded approach to the design of an e-learning research study" (p.13). A proposal to develop an EER plan for the GP program argument resonated strongly with the primary stakeholders, the project team, who were concerned to ensure an evidence base for improving the GP program design and for establishing its impact and effectiveness on student learners.

The book sets out a holistic, systematic and planned approach to educational evaluation and research. It is holistic in that it takes into account the different goals of educational evaluation (judgment and decisions to improve design) and research (understanding what is going on in the learning environment). It also guides EER planning to take into account the design-and-development cycle of an e-learning artefact or learning environment: life-cycle stage in design affects what research goals, and therefore what research questions, are appropriate.

Two key concepts key to the process of 'doing' an EER plan are the following:

> "… the challenge with evaluation research occurs most often early on in the process - in deciding on the direction of the study (what questions are to be asked), instantiating the direction into a clear methodology and then planning the specific details" (Phillips, McNaught et al. 2012: 111).
>
> "design evaluation is not a *one-off* activity. While it is clearly a major activity at the beginning of the e-learning life cycle, the design needs to be revisited after each cycle of design, development and implementation. Evaluation data at each stage will inform a revised design for the learning environment. Each new design should be subjected to a design evaluation, which may require a new round of peer review or expert judgment." (p.123).

The process diagram for evaluation-research (Fig. 7.1, p. 104) was followed to design the EER plan. There were several challenging aspects to this process, which benefitted from the mentoring relationship and access to specific advice on how to map the guiding principles and techniques in the book to the messy reality of the project. The perennial 'problem' of tacit knowledge articulated by Michael Polanyi, remains,

> Common experience also tells us that in teaching we rely on an intellectual effort of the learner for recognizing that which we are conveying to him. … the intellectual effort to find out how it is done. … our teaching relies on the capacity of the learner to discover for himself a considerable part of that which we are trying to impart to him, and to this extent we are imparting to him something that we cannot tell, and which he, in his turn, then knows and cannot tell (Polanyi 1969).

Thus while the book was a very useful guide for designing the EER plan, the experience of the first author was similar, perhaps, to that of a contestant in the Masterchef television program given the task of reproducing the signature dish of a renowned chef. It can be difficult to follow an unfamiliar recipe and reproduce a complex culinary outcome; careful reading of the recipe and exact following of steps is rarely sufficient. Personal encouragement and advice by the chef reduces likelihood of failure, however success also requires intellectual effort and imagination on the part of the learner to translate the meaning of words into personal knowledge, evidenced by the capacity to do what has been learned.

The project team is culturally diverse, geographically dispersed and multi-disciplinary. The unifying vision is to contribute to the development of students' 'cultural competence for life-long learning and work in a global society', so they can, in future personal and professional lives, fruitfully and effectively interact with people of diverse culture-based perspectives and practices.

The project team culture reflects this vision, fostering collaborative design effort and inclusiveness. Individual members are variously interested in evaluation and research activities and this suggested the need for a mechanism to produce, and then manage, a coherent and strategic plan of evaluation and research work. The formative evaluation of the project management processes confirmed the effectiveness of a 'working party' model for developing the Quiz, Module and Workshop elements of the GP program design. This model was applied to the task of EER design. The EER working party has developed the plan to date and will be responsible for its implementation. Its remit is to facilitate and document the evaluation research effort arising from the project and ensure formative evaluation of the EER plan, recommending improvements. Additionally, data collection methods and data sets trialled in the early phases of the GP program life cycle (phase one and two) could not be analysed to establish to what extent students acquire the 'global perspective' or 'cultural competence' graduate attribute through the GP program. This reinforced the need to design a diagnostic tool to measure 'cultural shift' with a view to having a validated tool ready for the mature educational design.

The result of the EER planning effort is a comprehensive plan that addresses the educational design, project management and scholarship. The current version includes research questions that are suitable and relevant to each of the life cycle phases of the GP program as its design is developed over time. The EER plan has been embedded in the project plan and will provide a framework to guide the ongoing quality assurance process for the GP program and a scaffold for developing research questions and methods so that as the GP program enters the maturity phase of its life cycle and questions of 'impact' and 'effectiveness' can be addressed.

Robert Wood
School of Computing and Mathematics
Charles Sturt University

For several mathematics and statistics subjects we included a variety of video-based resources including lecture captures. We surveyed students and found they appreciated and felt they learnt from the videos. Additionally, we recorded usage data and found a positive relationship between number of lecture captures downloaded and exam performance.

Keywords: lecture capture, mathematical education, video-based resources, usage data

What we did

- In several mathematics and statistics undergraduate subjects;
- For various modes: internal (with traditional lecture), hybrid and distance;
- Gave an assortment of video-based resources.
- We counted how many resources all students downloaded.
- We surveyed students for preferences.

Video-based resources used

For all subjects, the weekly lectures were captured to video and made available to all cohorts. Additionally, the following resources were used in some (but not all) the subjects:

- Shorter videos of single problem or concept;
- Video of solutions for assignments;
- Online interactive lectures (both live and recorded).

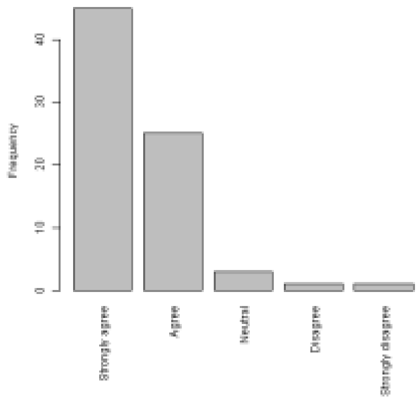

Figure 1: The lecture captures assisted with my learning

Results

Students felt they greatly benefitted from the lecture captures (Figure 1).

As a group, there was no clear preference for video vs text materials (Figure 2). To cater for all learning styles, written materials and video must coexist.

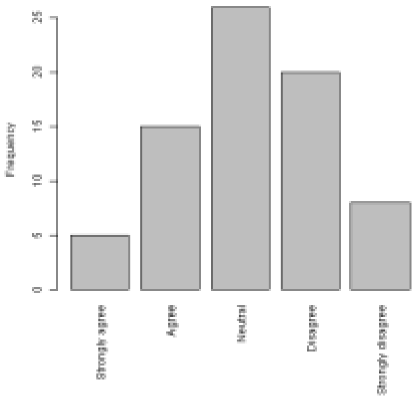

Figure 2: I learn more effectively using text based resources

About half the students (who had used both) preferred lecture captures to shorter videos (Figure 3). Furthermore, about a third of students (22 of 67) who had access to both types of resources did not look at any of the shorter videos. The most common reason selected was because the rest of the materials were sufficient.

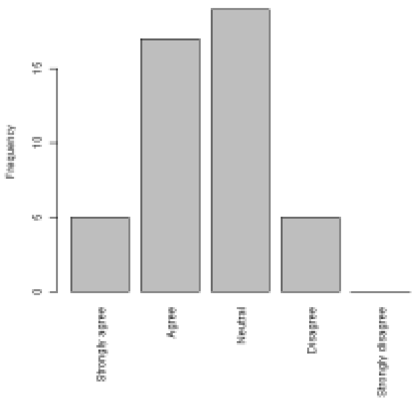

Figure 3: I prefer lecture captures to the shorter videos

Students were asked what video resources they would like to see in the future: recorded lectures, online lectures (combined and coloured red in Figure 4) and shorter videos and videos of solutions of assignments (combined and coloured blue). Students generally wanted to see more of everything, but there was a small but significant ($p=0.004$) bias to the non-lecture type resources.

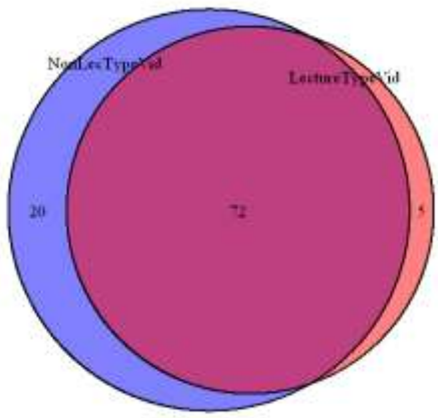

Figure 4: Preferred video resource (by type)

MTH101 - First year mathematics class

One particular subject in the study- a typical first year, first session mathematics subject – was offered in three modes: traditional lectures, hybrid = inverted classroom and distance. The difference in modes was based on geography and the cohorts' ability to learn independently. Figure 5 shows the number of lectures by mode that students downloaded in the 13 week session.

Two way ANOVA was used to investigate how exam performance was related to the number of lecture captures watched in MTH101. Mode was included in the model to avoid potential bias. There was a significant ($F=5.215$. $df=3,104$, $p=0.002$) relationship. Tukey's HSD shows (Figure 6) that students who downloaded most of the lectures (10-13) had a higher average exam mark than those who watched none or hardly any (0-2). Also, students who watched some (3-9) had a higher average mark than those who watched none. [Note: cause and effect cannot be determined from this data.]

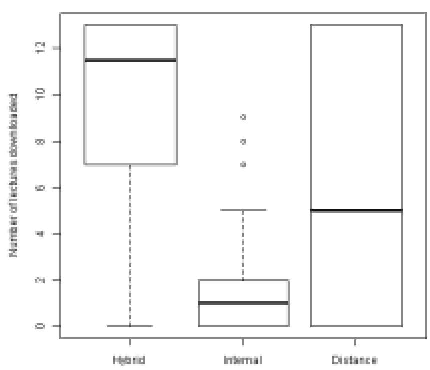

Figure 3: Number of lecture captures downloaded for different modes

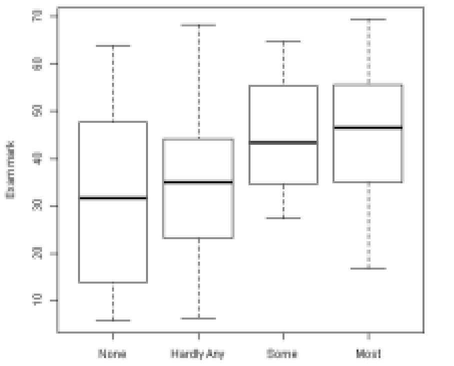

Figure 4: Exam performance versus number of lecture captures downloaded.

Conclusion

Students appreciated and felt they learnt from lecture captures and other video resources. Students who watched more lectures had a higher exam mark on average.

The analysis and use of data generated by students' interactions with learning systems or programs – learning analytics – has recently gained widespread attention in the educational technology community. Part of the reason for this interest is based on the potential of learning analytic techniques such as data mining to find hidden patterns in students' online interactions that can be meaningfully interpreted and then fed back to students in a way that supports their learning. In this paper we present an investigation of how the digital data records of students' interactions within an immersive 3D environment can be mined, modeled and analysed in real-time, to provide formative feedback to students as they complete simulated surgical tasks. The issues that emerged in this investigation as well as areas for further research and development are discussed.
Keywords: Data Mining, Feedback, Immersive Simulation, Learning Analytics.

Introduction: Analytics Rising

In recent years we have seen increased interest in the use of 'learning' or 'academic' analytics in education. It seems that after a long period of quiet contemplation, a mass of researchers, practitioners and administrators in the higher education and educational technology communities suddenly realized they were sitting on gold mines of electronic data that could be useful in understanding a range of educational processes. Like any gold rush, there has been a flurry of activity and interest as people gravitate towards the new boom. After being absent from the widely referred to Horizon Report, prepared annually by the New Media Consortium, analytics first appeared on the radar in 2011 and was touted as four to five years away from adoption. This year's Australian Horizon Report predicted that analytics is one year or less away from widespread adoption (Johnson, Adams & Cummins, 2012). While often proffering optimistic predictions, the Horizon Report does reflect the topics and issues that, at a single point in time, are in the frontal lobes of the educational technology community. And it seems from 2011 'analytics' was it.

Early educational writing on analytics tended to focus on how information in University databases could be used to support institutional reporting and decision-making. An area that received initial interest was how data from institutional repositories could be harnessed to predict students who were at risk. As Goldstein (2005) argued, in a competitive, resource-constrained environment, Universities are under "pressure to maximize student retention and shorten time to graduation" (p. 1). For example, in their paper on academic analytics, Campbell, DeBlois and Oblinger (2007) provide a number of examples where institutions in the United States have made use of data such as GPA, SAT scores, visits to campus, and students' use of the learning management system to predict outcomes such as students who are at risk and student retention. Similarly, Arnold (2010) reports on a system at Purdue University called "Signals", which takes data from the University's central systems and, using algorithms, "generates a risk level with supporting information for each student, represented by a green, yellow or red indicator " (p. 2). In an Australian context, the University of New England recently developed the

“Automated Wellness Engine” which shares some of the same goals.

Just prior to these developments, educational technology researchers became interested in how small and large sized teaching and learning tools could be used to capture data that could be used to support their understanding of students’ learning processes in electronic learning environments. In the early 2000s educational technology researchers such as Phillips, Baudains and van Keulen (2002) and Kennedy and Judd (2008) harvested data from electronic learning environments and used them to describe how students were completing learning activities. Some of these were based on students’ activities within learning management systems such as number of hits, the amount of time students were logged on, and frequencies of interactions. Researchers such as Judd and Kennedy (2008) sought to use similar kinds of data to find patterns in students’ interactions within interactive multimedia programs (Kennedy & Judd, 2008). This research into the more fine grained, micro-level behaviour of students within electronic learning systems was different to, but shared many similarities with, the macro, institutional level analytic approach described above. The need to parse, analyse, meaningfully interpret and report on large, complex data sets that had been digitally generated by learning and administrative systems was common to both.

However the differences between these two types of analytic endeavours has recently caused researchers to make a useful distinction between ‘Academic Analytics’ on the one hand and ‘Learning Analytics’ on the other. The recently formed Society for Learning Analytics Research [SOLAR] (Siemens et al., 2011) suggests that:

> Learning Analytics is the measurement, collection, analysis and reporting of data about learners and their contexts for the purposes of understanding and optimizing learning, and the environments in which it occurs …[while]… Academic Analytics is the improvement of organizational processes, workflows, resource allocation, and institutional measurement through the use of learner, academic, and institutional data. (p. 4)

Siemens et al. (2011), like Siemens and Long (2011), suggest that the target audience for these different analytic endeavours is different. Learning analytics is more focussed on providing an analysis to the learner, the educator and the teacher while academic analytics is more focused on providing advice to managers, administrators and funders.

The focus of this paper is on the application of learning analytics in an immersive simulation-based learning environment. It considers how data mining techniques can be used with large data sets generated by a simulation-based learning environment to generate meaningful, real-time feedback to students as they complete a complex educational task.

Learning analytics in education technology: A short history

The field of academic or learning analytics is seen as relatively new (Long & Siemens, 2011; Olmos & Corrin, 2012), based in part on the size and type of data being analysed (see Long and Siemens, 2011). However, the investigation and characterisation of students’ learning processes based on digitally generated user data – and the subsequent use of these characterizations for the purpose of student feedback – has a short but significant history in education. Two areas of educational technology research and development dominate here: Intelligent Tutoring Systems and User Interaction or Interactivity Research.

Intelligent tutoring systems (ITS) emerged in the 1970s after the educational technology community’s sustained interest in ‘Computer Aided Instruction’. Where Computer Aided Instruction programs were often based on simple drill and practice tasks, the goal of ITS was to “engage the students in sustained reasoning activity and to interact with the student based on a deep understanding of the student’s behavior.” (Corbett, Koedinger & Anderson, 1997, p. 850). A fundamental aim of ITS is to use artificial intelligence techniques to understand what students are doing with a piece of educational software so that advice and feedback can be provided to them to assist with their learning and understanding.

Most ITS are based on establishing an ‘expert model’ of interactions and inputs to the system that represents the ideal or optimal path or pathways through an educational task. This expert model may be used to create a ‘pedagogical model’, which is used to construct an ideal educational process for individual learners (see Beck, Stern & Haugsjaa, 1996). The system then records and analyses the behaviour, interactions and inputs of the student, which forms an individual ‘student model’. Crudely, by comparing the student model to either the expert or the pedagogical model for a particular task, the ITS can determine the difference between the two models – for example, where steps are not completed, where inputted data is incorrect, or stages of a procedure that are out of order – and provide intelligent, individualized feedback.

The learning activities upon which ITS are based often reflect tasks that have discrete steps or stages. As Van Lehn (2006) suggests “most tutoring consists of a chronological sequence of tasks that the student does with the aid of the tutor” (p. 228). While these learning activities and tasks can be used to support a range of types of learning outcomes – declarative, conceptual and procedural knowledge and understanding – the discrete and staged nature of the activities makes them amenable to the application of ITS. We do not mean to imply that these applications of ITS are simple; far from it. ITS often use sophisticated methods (e.g. Bayesian networks) to model very complex scenarios (e.g. complex physics or biomedical simulations) in order to determine both the expert and the student model. However, despite the clear success of some ITS, a number of researchers have noted that, for a variety of reasons, the ITS movement is yet to live up to its educational promise (Corbett et al.,1997; Dede, 2008). Cumming and McDougall (2000) go as far to say that by the late 1980s “ITSs were recognised as narrow and brittle” (p. 198).

In more mainstream educational technology research, user interaction or interactivity researchers have used log files or audit trails to gather data on students’ learning experiences in electronic environments. Weaver, Kemm, Petrovic, Harris and Delbridge (1999) created a multimedia program to help students learn about biological control systems and used audit trails to track how they went about the task of building models of these systems. Kennedy and Judd (2008) used a cluster analysis of students’ interview interactions with a virtual patient to show how there were clear groups of students within a single cohort that reflected different types of interactions. They suggested these groups had implications for both the design of the learning program and the nature of what different students may be able to learn from it. In a web-based environment, researchers have used log files or the tools within learning management systems to track how students interact and engage with both content (lecture recordings, lecture notes, web pages) and other students in activities like discussion forums (see, for example, Phillips et al., 2002; Dawson, McWilliam, & Tan 2008; Dawson, 2006a, 2006b; Dawson, Bakharia, & Heathcote, 2010).

While interactivity researchers often note the educational benefit that could come from providing students themselves with any analysis of their own learning behaviour and interactions (or possibly their teachers), typically this feedback loop is not completed. This represents something of a ‘holy grail’ for interactivity researchers in the educational technology community. Previous interactive educational programs have displayed limited adaptivity – the notion that the program would come to genuinely know or understand the student user and adapt or respond to his or her needs like an expert teacher or facilitator would (see Jonassen, 1985). When adaptivity has been built into a system, it has typically amounted to directing students to different parts of a referentially structured program on the basis of their past responses or performance. While ITS made a better fist of both feedback and adaptivity by employing more sophisticated expert and student models in complex domains, as mentioned above, these systems and techniques have not enjoyed widespread use. In short, the highly valued educational technology characteristics of genuinely intelligent feedback and adaptivity remain elusive.

Using Mined Data to provide Real Time Feedback

This brief history highlights that the field of educational technology has had a sustained interest in characterising students’ learning processes based on digitally generated user data and then using this to inform either the student, the designers of educational programs or students’ teachers. The lessons from these past research and development activities provide useful background for those with a new-found interest in learning and academic analytics. Our review also shows that in many cases the use of students’ on-task data is either relatively unsophisticated or is not used to provide immediate formative feedback to students while they are completing an educational task. For example, Computer Aided Instruction feedback is often very simple, while within the area of interaction research, the analysis of students’ interactions is typically completed long after the students have exited the system, if not the course.

More sophisticated Intelligent Tutoring Systems, such as those based on Bayesian networks, implemented in complex domains fare better (see for example, Conati, Gertner, VanLehn & Druzdzel 1997; Gamboa & Fred 2001). However, such models are based on a priori knowledge not only of what specific ‘input variables’ should lead to students’ success in any domain (the basis of the expert or pedagogical models) but also on the varied interdependencies between these input variables. This approach becomes problematic in domains where the experts find it difficult to fully articulate the input variables that lead to success (for example, factors predicting variations in surgical technique, elements involved in successful, high pressure decision-making). Data mining approaches, grounded in the behaviour and interactions of both expert practitioners and novice students become very useful in this context.

There are few examples of researchers using data mining techniques in the provision of real-time feedback to students in electronic learning environments. Sewell, Morris, Blevins, Dutta, Agrawal, Barbagli & Salisbury, (2008) used electronic measures collected within an educational surgical simulation as the input for data mining techniques and for the provision of feedback to users of the simulation. The metrics Sewell et al. (2008) used in the first instance, were univariate and reflected surgical behaviour or technique such as percentage of bone removed, use of excessive force and drill velocity. These were used to provide "interactive feedback … in the form of colored dots" (p. 74) and were shown to be effective in improving performance. As the user performed the virtual surgery "Bone that has been removed while maintaining proper technique according to the currently selected metric is colored green, while improperly removed bone is shown in red" (p. 74). In addition to these "raw data" measures, – as Sewell et al. (2008) refer to them – more sophisticated data mining approaches (Hidden Markov Models) were used to classify users' surgical technique as either "novice" or "expert". While these approaches reportedly worked well in summative discrimination, they were not employed as the basis for real-time formative feedback. In this paper we report on a research and development project in which we are seeking to determine how data mining techniques could be used with data generated from an immersive simulation-based learning environment, to provide meaningful, real-time feedback to surgical trainees as they complete an educational task.

Method

Participants

This study involved two groups of participants – an expert group and a novice group – with three participants in each group. The expert group consisted of two qualified ENT surgeons and one surgical trainee, while the novice group consisted of university students with no medical or surgical training.

Materials

Participants performed simulated surgical procedures on a temporal bone simulator. For a number of years we have been involved in a research and development project that has considered how haptically-enabled, 3D immersive environments can be used for the education and training of surgeons (see O'Leary, Hutchins, Stevenson, Gunn, Krumpholz, Kennedy, Tykocinski, Dahm & Pyman, 2008; Zhao, Kennedy & O'Leary, 2011). Zhao, Kennedy, Yukawa, Pyman & O'Leary, 2011; Zhao, Kennedy, Hall, Rathod & O'Leary, 2010). As part of this program of research we have developed a high fidelity surgical simulator for ear surgery procedures. A 3D virtual model of the temporal bone (the bone behind the ear) is created from micro-CT scans and this is rendered and displayed using a 3D monitor. When viewed with 3D glasses an illusion of a 3D operating space is produced. Users interact with the rendered model of a temporal bone using two pen-like haptic devices (a drill and an irrigator) that provide force feedback to the user (e.g. the user can 'feel' differences in bone hardness). In addition to the sensation of touch, the immersive 3D environment provides the user with visual (e.g. bone dust, blood) and sound cues (e.g. drill speed). Figure 1 shows the basic set up of the simulator and Figure 2 shows the rendered model of the temporal bone with the surgical drill.

Procedure

The functions and operation of the simulator were explained to all participants and they were given time to familiarize themselves with it. Participants in the novice group were provided with a video of a single surgical procedure (a cortical mastoidectomy) performed on the simulator by an expert surgeon. The video included a voice-over clearly explaining the aims of each stage of the procedure and how it should be performed. The video was displayed on a second monitor and novices were allowed to refer back to it while they undertook the procedure in the simulator whenever they felt it was necessary. Furthermore, novices were provided with an annotated diagram showing the position of each anatomical structure within the simulator.

Figure 1: The surgical simulator with a single haptic device

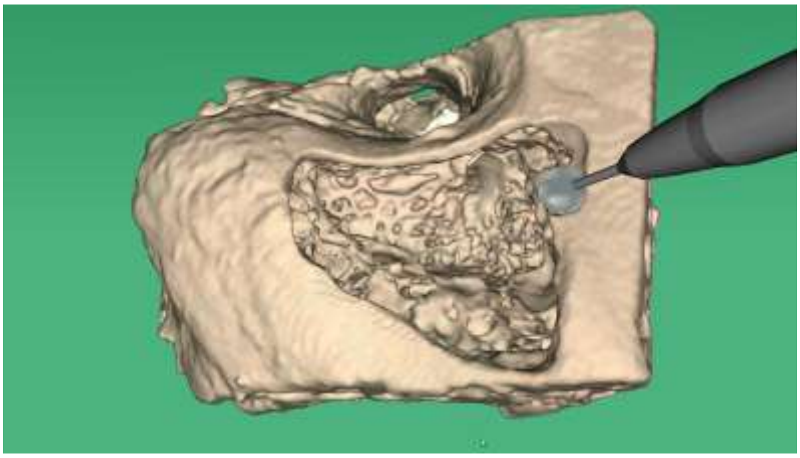

Figure 2: The simulation environment showing the drill and a partially dissected temporal bone

A list of the metrics recorded automatically by the simulator is shown in Table 1, and they are classified as general metrics, metrics associated with tool position, orientation and force used, drill burr metrics (i.e. the size and shape of the drill bit), metrics associated with proximity and force in relation to three key anatomical structures, and finally, metrics associated with the whole temporal bone being virtually operated on. These metrics were recorded at a rate of approximately 15 records per second, resulting in large data sets even for relatively short surgical procedures.

All participants performed their simulated surgical procedures in a research laboratory. Participants were able to complete their simulated surgery at a standard computer workstation, using the equipment described above and shown in Figure 1. The procedure chosen as the basis for this investigation was a cortical mastoidectomy, which is the preparatory step of many otological operations and is the most basic of all mastoid operations (Atlas, 2006). The aim of mastoidectomy is to dissect the temporal bone by removing bone using a high-speed drill while preserving the underlying anatomical structures (referred to as 'skeletonizing' a structure). A mastoidectomy is performed in a series of steps, during which the surgeon identifies a series of anatomical landmarks, which allow him or her to safely remove the surrounding bone. For the purposes of this investigation, the mastoidectomy procedure was divided into five stages. Participants were asked to carry out these stages sequentially and indicate to the researchers whenever they completed a stage. The five stages of the cortical mastoidectomy procedure were (i) perform initial cut into cortical bone; (ii) find the sigmoid sinus and skeletonize it; (iii) find the dura and skeletonize it; (iv) find the antrum; (v) find the incus. Each participant repeated the mastoidectomy procedure ten times, resulting in 60 data sets.

Table 1: A list of 48 metrics that are generated from the 3D immersive environment

Metrics derived from the VR Simulator

- General metrics
    - Timestamp (seconds)
    - Current stage (1 to 5)
- Tool position, orientation and force metrics
    - Current force applied by drill tool (X,Y,Z)
    - Current force applied by suction tool (X,Y,Z)
    - Current position of drill tool in simulator coordinates and haptic device coordinates (X,Y,Z)
    - Current position of suction tool in simulator coordinates and haptic device coordinates (X,Y,Z)
    - Current orientation of drill tool in simulator coordinates and haptic device coordinates (X,Y,Z, Angle)
    - Current orientation of suction tool in simulator coordinates and haptic device coordinates (X,Y,Z, Angle)
- Burr metrics
    - Whether a burr is currently loaded (Yes/No)
    - Whether the burr is currently spinning (Yes/No)
    - Burr ID (1 to 9)
    - Radius of the current burr
    - Sharpness of the current burr
    - Whether the current burr is fluked (Yes/No)
- Anatomical structure metrics (for sigmoid sinus, dura and facial nerve)
    - Whether the drill tool is touching the structure (Yes/No)
    - Whether the suction tool is touching the structure (Yes/No)
    - Force applied by the drill tool to the structure surface (X,Y,Z)
    - Force applied by the suction tool to the structure surface (X,Y,Z)
    - Distance of the drill tip from the closest point of the structure surface
    - Distance of the suction tip from the closest point of the structure surface
- Bone specimen metrics
    - Specimen translation (X,Y,Z)
    - Specimen rotation (X,Y,Z, Angle)
    - Virtual microscope magnification level
    - Whether specimen transparency is on or off
    - Number of voxels eroded up to the current time stamp

Results and Discussion

In this section, we describe the process used to derive the data and algorithms that were used as the basis for the prototype development of a real-time feedback system. From the 48 raw metrics (Table 1), we calculated 65 high level statistical metrics such as mean stroke force magnitude, maximum speed, average hand distance, etc. We applied the *Apriori* algorithm to find association rules between these high level metrics and surgical expertise (novice, expert) in each stage (Agrawal, Mannila, Srikant, Toivonen & Verkamo, 1996). From the vast number of association rules that emerged, we selected the most useful based on a number of criteria. First, the rules needed to show high 'support' and 'confidence', which are standard statistical mechanisms for evaluating the quality of an association rule (Agrawal et al. 1996, Jiawei & Kamber, 2001). Second, we restricted the rules to those that contained metrics that could be computed in real time. Some metrics (e.g. percentage of strokes near the sigmoid sinus) would be difficult if not impossible to compute and use as the basis for feedback in real time, while others did not have this difficulty.

After applying these two filters, we decided to select a single rule to determine whether it was possible to develop a prototype real-time feedback system based on just one rule; with the view that if we could do it for one rule we would be able to do it for many. The association rule selected was: **If mean stroke force is less than 0.23 Newtons, then a novice has performed the surgery.** This rule showed 0.78 confidence and 0.45 support which means that 45% of the virtual surgeries were completed with an average force magnitude of less than 0.23 Newtons and when this was the case 78% of these were performed by novices. This rule was thought to be suitable for further exploration given that 50% of surgeries were performed by novices and we were confident in predicting a surgeon's novice status 78% of the time. The high confidence and support of this rule indicate that using force to predict expertise is promising. Hence, the force magnitude was deemed appropriate input data with which to build a Hidden Markov classification model.

A typical Hidden Markov Model (HMM) has two parts: hidden states and observation metrics, whose values are affected by a given hidden state. In the context of surgical simulation, the surgical "technique" or "gesture" participants showed while they were using the surgical drill reflect hidden states that cannot be directly measured using the simulator (Rabiner & Juang, 1986). However, these surgical techniques are directly related to the force applied by the participant, which can be directly measured using the simulator. After discussion with expert surgeons and reviewing the videos of participants' simulated surgeries, three typical drill techniques were identified as being used by participants during the cortical mastoidectomy simulation: stabbing motion (generally to be avoided), sweeping motion (generally favoured) and stabbing-sweeping combination. These three drilling techniques were defined as three hidden states of a HMM. Since the 'observed' data required for input into a HMM needs to be nominal, the force magnitude values were "discretized" into low and high using the threshold of 0.23 Newtons. When the HMM was applied it performed significantly better than the application of the simple association rule described above. Across the first three stages of the procedure the HMM was 12.9%, 8.1% and 17.6% more accurate in its discrimination than the application of the simple association rule alone.

Using the HMM topology shown in Figure 3, an expert HMM (E-HMM) and a novice HMM (N-HMM) were built from force data sequences, using the Baum-Welch (Baum, Petrie, Soules & Weiss, 1970) algorithm. Once these two models were established they could be used as comparisons with the technique of an individual undertaking a new surgical procedure in the simulator. Put simply, if the technique of the individual carrying out a new surgical procedure is similar to the E-HMM there is no need to provide feedback; however, if the technique is closely aligned with the N-HMM, then feedback should be provided.

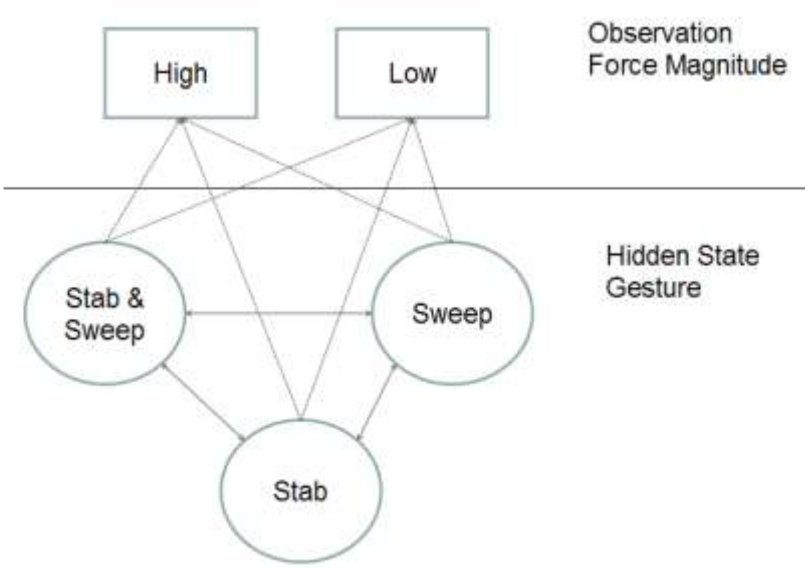

Figure 3: The Hidden Markov Model topology

However, this was not simple. In order to provide real-time feedback, the degree of expertise shown by an individual undertaking a new surgical technique needed to be established in a circumscribed "time window". There is no point in waiting until the end of the procedure to determine whether an individual is showing novice drilling behaviour – any feedback would be summative at that stage. Equally, enough data needed to be collected in a discreet time window to ensure that the predictions about the expertise of the individual operating were reliable. Thus, in response to the critical question of determining the parameter window size we needed to evaluate the trade-off between the window size and the feedback reliability. While we could have opted for a fixed duration for the parameter window size, this has several disadvantages (e.g. it would likely break continuous surgical strokes into arbitrary units and, as each surgeon performs at a different speed, it would be preferable to determine individualised window sizes). Therefore, we used points during the surgery when the surgeon paused – ever so briefly – in the operation to dynamically define the parameter window size. These pauses could be easily identified by automatically determining when the force magnitude of the drill approached zero or the drill head was not spinning (i.e. it was not in use).

Once we had resolved how to determine the size of the parameter window, we were able to dynamically apply the HMMs (E-HMM and N-HMM) to the continuous stream of data emerging from the simulator. By putting HMM and 'surgical pauses' together, we could continuously record the force applied during a surgical procedure and, when a surgical pause happened, we were able to dynamically calculate the similarity of the force data stream with two trained HMMs. If the force data stream was more like the E-HMM, no feedback was provided. If the force data stream across the parameter window accorded with the N-HMM, real-time feedback was provided to the participant. In our prototype system this feedback is textual and screen based, letting the participant know they can adjust the force they are using and that they are being "too tentative" in their approach (see Figure 4). We have begun working on alternative visualisations and audio presentations of feedback.

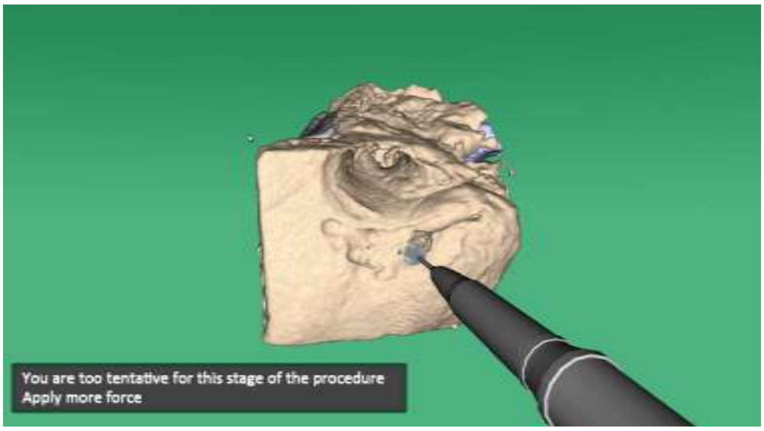

Figure 4: The simulation environment with a display of automated real-time feedback relating to overly tentative surgical technique

Conclusion

In this paper we have described the way in which we were able to develop a prototype system for presenting real time feedback to users in a virtual learning environment based on data mining techniques. While the implementation of the prototype was, on one level, a success – it worked – the research and development work we have been undertaking and presented here has raised many issues. Reimann and Markauskaite (2010) indicate that there are numerous technical, legal and methodological considerations to be dealt with when using educational technology data that are "flowing in streams" (p. 259) and we have encountered some of these in this project.

The three principal challenges we encountered in the development of the prototype were:

- Meaningfulness. As has been noted by others, it is relatively simple to automatically collect data from digital learning environments, but it is more difficult to meaningfully interpret this data and present it to the end user. By using association rules and data mining techniques we were able to build sophisticated expert and novice models of surgical technique. However, being statistically generated, these rules and models were agnostic when it came to meaning, and we constantly needed to draw on the advice of expert surgeons to interpret the models. While the 'bottom-up' statistics could be used to discriminate novice and expert surgical technique, the rule or model was only useful if it could be (i) meaningfully interpreted, 'top down' by an expert surgeon and (ii) be meaningfully displayed as feedback to the end user.
- Temporality. As mentioned above, a critical component of the development of the system was to determine the appropriate window size for recording and analyzing users' data in real time. There was a need, for a specific rule and model, to have a time-window size that allowed enough information to be collected to make a robust diagnostic decision, but at the same time not have a time-window that was so long that it delaying feedback to the user, to the extent that it became summative.
- Openness. There were challenges associated with working within an open educational technology system where users could essentially do whatever they wished as opposed to more constrained procedural educational technology systems that are defined by a sequential, step-wise approach to complex domains. The openness of the system meant that there was considerable noise in the data that may not have been apparent with a more closed system.

In addition to these challenges, the development and implementation of this prototype system raises many questions that will be the subject of future research. A key focus of our future research will be on how multiple surgical technique variables, rules and models can be used – analysed and interpreted – as the basis for meaningful real-time feedback to end users. This will require us to consider the issue of how to most adequately display complex user-performance information to individuals as they are engaged in simulation-based education and training. This is of course, not a new issue, and research in the area of human factors and human-computer interaction will provide some direction in this area.

These represent significant challenges in our future research. However, these challenges are worth striving to overcome, as there would be clear advantages to be gained from determining how the mining of streams of data from complex, virtual learning environments could be used to provide meaningful, real-time feedback to users. In the current context of surgical education and training, an expert surgeon is typically required to provide feedback as tasks are undertaken by novice trainees. The provision of meaningful real-time feedback in simulated training could offer significant savings in terms of expert surgeon time and scarce cadavers. This would allow the immersive simulator described in this project to be employed as a self-directed learning tool in basic training, prior to students receiving more tailored instruction with an expert surgeon on cadavers or in the operating room.

Distributed Learning Spaces in Higher Education Learning and Teaching

Mike Keppell
Professor Australian Digital Futures Institute
University of Southern Queensland

PhD, University of Calgary (1997); MEd University of Calgary (1989); BEd, University of Queensland (1985); BHMS (Ed), University of Queensland (1982). Professor Keppell has a long professional history in higher education in Australia, Canada and Hong Kong. Professor Mike Keppell is the Executive Director, Australian Digital Futures Institute (ADFI) at University of Southern Queensland. From 2007 to 2012 he was Professor of Higher Education and Director of the Flexible Learning Institute at Charles Sturt University, and prior to that was Head of the Centre for Learning, Teaching and Technology at the Hong Kong Institute of Education. Professor Keppell has also held positions at the University of Melbourne, Central Queensland University and private providers in Canada.

Intended audience and degree of expertise/past experience required

The workshop will be of interest to all delegates attending ascilite. In particular academic developers, instructional designers, educational designers and staff involved in blended and flexible learning will have an interest in the workshop.

Statement of objectives for the workshop

To provide an overview of distributed learning spaces (physical (formal and informal); blended, virtual (formal and informal); mobile, personal, outdoor, academic and professional practice spaces) and discuss the 'action possibilities' or affordances of these distributed learning spaces. Taking account of these affordances will inform the design of learning and teaching in higher education and inform the choice of technology to assist learners and academics in life-long and life-wide learning.

Detailed description

Justification of the importance/currency/need for the proposed workshop

Distributed learning spaces and their learning affordances are at the core of earning in the 21st century. Too often the importance of distributed learning spaces has been dismissed as being unimportant compared to the formal physical learning spaces of the university institution. 21st Century learning is now typified by personal learning environments where the place of learning is varied and diverse. This workshop will assist participants to consider the personal learning spaces of students whom they teach. In addition the action possibilities of distributed learning spaces needs to be considered in the explicit design of learning and teaching for higher education.

Format of the session

- Introduction (5 mins)
- Overview of distributed learning spaces (15 mins)
- Discussion in groups of three – 'action possibilities' of distributive learning spaces (15 mins)
- Report back and full group discussion about 'action possibilities' (15 mins)
- Where to next? Implications for our practice (10 mins)

Presentation format

Facilitated workshop combining presentation of concepts, group work and discussion, reporting back to entire group.

Ways in which the audience is encouraged to participate

Facilitated workshop as opposed to a presentation. This will include: small group discussion, questioning, determining ‘action possibilities’ for distributed learning spaces. The audience will be encouraged to discuss the relevance of distributed learning spaces and their implications for the learner studying in the 21st century. The group discussions and activities will focus on:

- Sharing knowledge, experiences and expertise about distributed learning spaces.
- How a knowledge of the affordances of distributed learning spaces might be used within participants own institutions or discipline areas and how they might be employed and modified for use in other contexts.
- A further action theme will be discussion and reflection on distributed learning spaces and how these might inform and enhance practice in participants own institutions and discipline areas.

Outcome measures

- This workshop will develop a number of ‘action possibilities’/affordances for a range of distributed learning spaces.
- Participants will develop a knowledge of these ‘action possibilities’ and their implications for the design of learning and teaching for open learning environments.
- It is hoped that participants will more fully consider the personal learning environment of the virtual student after considering the affordances of distributed learning spaces.
- Development of strategies and initiatives for distributed learning spaces within and/or across specific

Exploring the challenges of network leadership in Australasian tertiary associations

Mike Keppell
Professor, Australian Digital Futures Institute

James Sankar
AARNet

James Sankar is responsible for AARNet's (Australia's Academic and Research Network) Applications and Services division. He has extensive experience of managing a range of online service from middleware, voice and video over IP to mobile/wireless services. His passion is in mixing talent with new technology to deliver solutions and new services that benefit from access to high-speed research and education networks.
James is an active member of the Open Visual Communications Consortium; a global industry led effort aimed making video conferencing work the same way the telephone works today. He has led the creation of AARNet's National Video Conferencing Service, AARNet's Unified Communications and Telepresence Exchange services.

Outline of focus area and summary of ideas to be explored

Social networks and communities of practice in Tertiary Education Associations (e.g. ACODE, ascilite, CADAD, HERDSA, ODLAA) provide value for members through the social learning experiences they provide in terms of "sharing information, tips and documents, learning from each other's experience, helping each other with challenges, creating knowledge together, keeping up with the field, stimulating change, and offering new types of professional development opportunities" (Wenger, Trayner & Maarten de Laat, 2011, p. 7).

Networks and communities blend "individual and collective learning in the development of a shared practice" and are social spaces for learning (Wenger et.al, 2011, p. 10). Networks involve a "set of relationships, personal interactions, and connections among participants who have personal reasons to connect. It is viewed as a set of nodes and links with affordances for learning, such as information flows, helpful linkages, joint problem solving, and knowledge creation" whereas a community "refers to the development of a shared identity around a topic or set of challenges" (Wenger et.al. 2011, p. 9). Owen-Smith (2008) suggested that networks emphasise resource and information channels, status recognition and social influence for members.

Building upon this focus on networks, this symposium specifically examines network leadership. The NNI understands the term network leadership to include the development and maintenance of sustainable social networks and communities of practice; effective communication strategies and technologies; and leadership decisions which provide utility for the organisation, members and Australasian tertiary sector.

The symposium will discuss how the NNI seeks to address the following key foci:

1. Improving network leadership by gathering data on existing practices and perceptions related to member engagement and technologies and strategies that support best practice in network leadership.
2. Using findings and member expertise to better support leaders of established tertiary education associations to encourage collaboration and increase member engagement.
3. Fostering, encouraging and supporting network-based collaborative initiatives into the future.

The research is being conducted in two phases, beginning with a survey of the members of project partners and focus groups with the executives of project partner organisations. Stage 2 involves partner organisations conducting their own small research projects in related areas. This data will then be collected and analysed to assist in the development of a 'tool kit' to network leadership.

Range of views that panel members will represent

The panel members hold a range of views and perspectives due to the variety of organisations that they represent. ACODE, CADAD, ODLAA, HERDSA, OLT and ascilite represent key professional and scholarly bodies, whilst AARNet and NetSpot offer the perspectives of both not-for-profit and commercial technology providers. Additionally, representatives originate from a range of Australasian Universities, ensuring a broad diverse range of views and perspectives are held.

Describe the intended audience

The intended audience has an interest in the Australasian tertiary sector, specifically in the areas of good practice in educational technology and tertiary networks.

Outline of the symposium format, including strategies that will be used to engage the audience

Introduction and overview

Symposium will begin with an introduction to the NNI project by Professor Mike Keppell and Associate Professor Gordon Suddaby who are project co-leaders. This will include an overview of the phase 1 research into network leadership and the initial findings. This introduction will be supported through a demonstration of the project blog and multimedia snippets describing the thoughts of project members.

Partner research summaries by member representatives

Following on from the phase 1 research and its findings, each partner organisation will conduct their own small research project in an area of particular interest to their organisation and circumstances. Whilst these projects will be in their infancy at this stage, each partner representative will summarise the key objectives, foci and methodology of their projects in a 5 minute presentation.

Synthesis

Professor Keppell and Associate Professor Suddaby will provide a synthesis of these projects, how they relate to the objectives of the NNI and phase 1 research findings before examining how the project's findings will contribute to the sector.

Questions

The presenters will take questions from the audience.

Finding a Voice: Learning pronunciation in a second language using a dedicated speech technology

Thomas Kerr
The Learning and Teaching Centre
Macquarie University

This paper reports on a recent experiment that used Wimba Voice Board (WVB), an online asynchronous recording and playback utility, for teaching basic pronunciation rules to a group of novice learners of Spanish. The experimental design used a pre/post-test format with an intervention where participants in the experimental group were given access to a built-for-purpose Blackboard online unit and encouraged to engage with the learning materials in self-directed study (Victori and Lockhart, 1995; Lee, 1997). Participants were also able to voluntarily upload their own attempts at pronunciation to a WVB module accessed by all group members, listen to attempts uploaded by peers, and provide optional feedback. Control group members were taught the same content in a traditional teacher-led classroom setting. Two focus groups were conducted with members of the experimental group. Analysis of the collected data showed that WVB was able to produce results that were equivalent to those achieved by members of the control group.

Keywords: second language learning, speech technologies, Wimba Voice Board

Introduction

Text-based asynchronous discussion boards have been used in second language (L2) learning settings as long as the World Wide Web has existed, at least since the early 1990s (Warschauer, 1996). In teaching approaches that emphasise communicative competence (Hymes, 1967; Canale, 1983; Swain, 1985; Littlemore and Low, 2006), the issue of correct pronunciation becomes critical if the goal of effective communication is to be achieved. Speech technologies such as Wimba Voice Board (WVB), an online asynchronous recording and playback utility (Wimba.com, 2010), offer educators the ability to provide opportunities for groups of learners to exchange recorded attempts at pronunciation, thus promoting peer and self-directed learning.

A recent study at a a metropolitan Australian university attempted to teach a group of novice Spanish learners the basic pronunciation rules that govern correct speech production using a speech technology (WVB), and without explicit instruction by a teacher. Ethics approval was obtained for the study as it involved quantitative analysis of the participant's test scores and qualitative analysis of their opinions about the software used. Participants in an experimental group were given access to a built-for-purpose Blackboard unit containing text-based instructions on the basic rules of Spanish pronunciation. They were also able to access model recordings of all the words and phrases used. Two WVBs were included, allowing personal and group asynchronous practice. An equivalent control group was taught the same rule set by a native Spanish-speaking tutor in a traditional classroom setting.

The research question had two components; first, it asked if a speech technology such as WVB could be used to improve pronunciation in a second language, and second, it asked if the learning was effective when compared to traditional ways of learning the same material. The choice of the learning task was kept deliberately simple, as it was the efficacy of the speech technology itself in a specific learning task that was under investigation, rather than the technology's effectiveness as a language-learning tool. Scanlon and Issroff (2005) argue that basing the evaluation of a learning technology solely on maximised learning outcomes is too limiting in attempting to understand how the technology influences learning, given the complex issues (Oliver and Harvey, 2002) involved (p. 431). They advocate the use of an approach based on an extended version of Activity Theory that accounts, in part, for this complexity. Bearing this in mind, the researcher chose to extend the reach of the study by incorporating a qualitative analysis of the software use based on focus groups conducted with some of the participants exposed to the speech technology.

A primary aim of the research was that the results obtained and their subsequent analysis would inform both the future design of online language courses and those educators seeking to incorporate speech technologies in their teaching. This potentially contributes to the conference theme of 'learning for the future' and would enable L2 courses be delivered in an alternative mode in subsequent offerings.

Experimental study design and deployment

The study design used a mixed methods approach (Johnson and Turner, 2003), where both quantitative and qualitative data were collected and analysed. Quantitative data consisted of results obtained from pre and post-tests administered to two groups. Qualitative data was derived from analysis of two focus groups conducted at the conclusion of the study's experimental phase.

The experimental approach used was based on a comparative pre-test post-test control group design as described by Shadish, Cook and Campbell (2002). Participants were randomly assigned to either an experimental or control group and further randomized for gender. The final makeup of the groups was nine participants in each, with genders approximately equally distributed between groups. Participants were recruited from staff at the author's institution. In order to establish a common baseline for previous language-learning experience, all participants were asked if they had any previous experience in learning Spanish. Only respondents with no previous experience were subsequently chosen as participants in the study.

The pre-test was administered to individual members of both groups in an isolated test space chosen for the purpose. All participants were given a list of 20 words to pronounce in Spanish, each with an accompanying contextual phrase containing the word. The list consisted of previously unseen words and associated contextual phrases in Spanish known to be challenging for new learners of the language ((Diaz-Campos, 2004). Words such as *nicaragüense* (Nicaraguan) and *rehenes* (hostages) are not normally encountered in introductory Spanish courses, but were included to provide a high level of pronunciation contrast in order to test the efficacy of the two teaching methods used. Participants were asked to work through the list making their best guess as to how to pronounce each word and phrase. All attempts were recorded using the Wimba Voice Board technology and coded for subsequent rating by raters who were native speakers of Spanish. In the intervention phase of the study all participants were then either taught in a teacher-led face-to-face traditional classroom or given access to an online unit for self-directed study.

The control group received instruction in the basic rules of Spanish pronunciation in a traditional classroom setting. Two sessions were run, each lasting approximately 45 minutes and attended by groups of 4 and 5 participants. The instructor used a series of slides titled "Basic Spanish Pronunciation" (Fig.1) that included basic rules of pronunciation with example words and sentences, and a list of the same 20 words and contextual phrases used in the pre-test.

Figure 1: Example slide from the Basic Spanish Pronunciation slideshow used with the Control group

The teaching approach used was listen-and-repeat where the instructor provided a model sound and the participants attempted to repeat it. The instructor also provided some additional phrases not included in the slide materials in order to provide additional contextual examples of use. Participants were asked to make both group and individual responses when pronouncing words and phrases from the list. At the conclusion of the session, the participants were offered a printout of the instructional slides and told that they could refer to them if they wished. There was no instruction to either collaborate with their peers or to avoid comparing their learning experience. That is, participants were free to practice their pronunciation as they wished, with or without the support of their co-participants.

The experimental group did not receive any direct instruction apart from basic instruction on how to record, upload and play back personal and peer attempts at pronunciation. All of their learning was conducted online within a dedicated Moodle unit. They were able to access the same set of slides used with the control group, with the difference that all model sounds for the words and phrases were pre-recorded by the instructor and made available through embedded playback consoles on each page. The actual content of the Basic Spanish Pronunciation module was the same for both the control and experimental groups. In addition to the pronunciation module, the experimental group was able to access two dialogue modules. The Private Practice Board gave users the opportunity to record, upload and play back their attempts at pronouncing the word list, knowing that access was restricted to the online moderator and themselves. The Pronunciation Discussion Board was designed to allow opportunities for peer-supported learning. Participants were encouraged to make a minimum of two uploads of to the board over a 48 hour period and to comment on at least one other learner's attempt.

All participants then completed a post-test consisting of recordings of the same list of 20 Spanish words and phrases, but in randomized order in order to avoid the possibility of threats to validity through memory or sequenced learning effects that might arise if the lists were exactly equivalent.

Within one week of the administration of the post-test, two focus groups were run with five volunteer members of the experimental group. Both sessions were recorded and transcribed for further analysis. The focus groups were conducted with two and three volunteer participants from the experimental group only, as the qualitative enquiry related to use of the WVB speech technology used by them for completing the pronunciation task. Prompt questions used by the focus group leader were designed to elicit responses relating to technology use from both cognitive and emotional points of view. Participants were asked pragmatic questions such as whether they thought the use of the WVB software had helped them in the learning task, ("Do you think the VB software helped your pronunciation of some Spanish words? If so, how do you think it helped?"), how useful they thought interacting with other learners was, and how this experience compared with interacting with a tutor. They were also asked to compare use of the software for learning with learning in a classroom or tutorial group.

Findings

The 18 participant recordings from the pre and post-tests were collected and de-identified with a series of code numbers. These were then rated by a native speaker of Spanish (Rater 1) using a rubric sheet with a five-point likert scale. Ratings included: "Needs practice" (1), "Below average" (2), "Average" (3),"Good" (4) and "Excellent" (5). To establish inter-rater reliability, 6 of the pre/post-test scores, randomly selected from both control and experimental groups were also rated by a second native speaker of Spanish (Rater 2) using the same rubric sheet, representing a 33% sample of the total population Statistical analysis of the two rater score sheets for the same six participants indicated that there was no significant difference between the two raters' scores. Rater 1's pre and post-test totals difference scores for all 18 participants were then compiled and ranked in ascending order then compiled in a chart for purposes of comparison (Fig. 2).

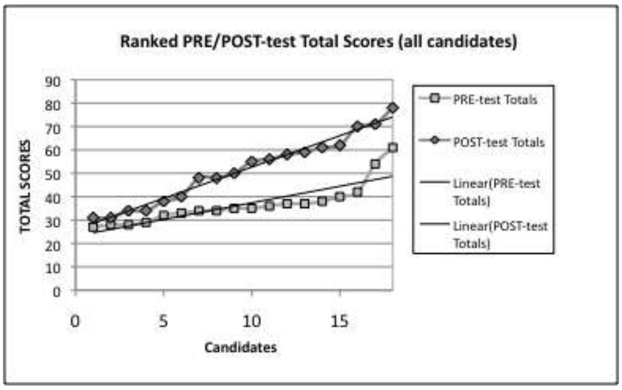

Figure 2: Ranked pre/post–test totals for all 18 candidates with trends indicated

Post-test total scores trend higher than the pre-test scores as would be expected, as all candidates had been exposed to the word list in the pre-test and then again in either the classroom session or in the WVB online unit. A Mean difference score was calculated for all 18 candidates resulting in a score of 14.67. On average, with the exception of a single outlier, all candidates improved their scores on any given word from the word list by an average score of 0.733 (Mean / word count).

The first part of the research question mentioned above suggests a hypothesis that an analysis of the data from the experimental group's pre and post-tests would show a significant improvement in performance indicated by the difference scores achieved; that is, a measurable, positive score difference in the post-test. The second part of the research question suggested a null-hypothesis; that is, that analysis would *not* show a significant difference in pre and post-test difference scores between the experimental and control group participants. Pallant (2005) suggests that non-parametric analysis methods are indicated in small sample populations such as the WVB study, with non-normal distributions. To determine the validity of adopting this approach, a preliminary test series for normality of distribution was first run using Kolmogrov-Smirnov and Shapiro-Wilk tests. Establishing a normal distribution of difference scores requires a significance ('p') value of < 0.05. Both the Kolmogorov-Smirnov and Shapiro-Wilk measures (.200 and .991) were significantly higher, indicating that non-parametric analysis would provide the most authentic results.

Two measures were adopted to determine the significance of the effect of the intervention (the experimental group's use of WVB to complete the learning task);

- a non-parametric test (Related-Samples Wilcoxon Signed-Rank test) was applied to the experimental group's pre and post-test totals to determine the significance of the median of differences between them
- **a** Descriptives Table was produced including Mean, Standard Deviation and Variance measure**s.**

Results from both measures indicated that a significant, positive difference existed between the experimental group's test totals when pre-and post test were compared. That is, the post-test scores were significantly higher, supporting the hypothesis derived from the first part of the research question. In order to test the null-hypothesis derived from the second part of the research question, difference scores from the control and experimental groups were compared using an Exact significance measure for both 1-tailed and 2-tailed outcomes. A significant difference in the experimental and control groups' pre/post-test difference scores would be indicated by a significance level of < 0.05. Results obtained from the Asymptotic Significance 2-tailed score (.185) and the Exact Significance scores (0.190 and 0.197) for both 1 and 2-tailed outcomes all fell substantially above 0.05, indicating no significant difference detected when comparing the two groups' difference scores and supporting the null-hypothesis.

Analysis of the two focus groups showed that a significant level of anxiety was experienced by at least some members of the experimental group when making recordings for uploading to the Blackboard unit. Despite this, all participants reported that they thought that use of the WVB software had assisted them in a positive sense while attempting to learn correct pronunciation in the L2.

Conclusions

Results from the analysis of the pre and post-tests results for the two groups participating in this study indicate that 17 of the 18 participants showed a measurable improvement their ability to pronounce Spanish words correctly. This suggests that, excluding the control group results, use of WVB as the sole means of learning correct pronunciation in Spanish can produce measurable gains in novice learners. Results from the comparison of the experimental group's difference scores with those of the control group indicated no significant difference in the learning gains achieved. The conclusion suggested is that use of speech technologies such as WVB can produce equivalent results to those achieved through traditional forms of teacher-led classroom instruction in an L2. An interesting result of the focus group discussions was that at least two participants thought that, with appropriately designed content, prospective language students could use speech technologies such as WVB to preview a language course by attempting a simple learning task such as the basic rules of pronunciation before committing to an intensive study of the language itself. This suggests that speech technologies have a definite role to play in future language education and that the results of this study could inform the future design of online language courses in sometimes unexpected ways.

An innovative approach to facilitate critical thinking and reflective learning in prescribing and therapeutics e-learning

Santosh Khanal
NPS: Better choices, Better health

Y. Zuo

A fully online and standardised national curriculum for prescribing education, National Prescribing Curriculum (NPC), is offered to students of multiple health disciplines in Australia. The NPC consists of 28 self-paced one hour modules based on World Health Organisation's Guide to Good Prescribing. Health professional education requires didactic teaching to be blended with interactivity, problem solving, critical thinking and self-reflection. The NPC offers the students flexibility and interactivity and increases their prescribing knowledge to help them solve relevant problems. Going forward, there is a need to enhance the teaching capabilities of the module by facilitating critical thinking and reflective learning. In this paper, we discuss an innovative approach of embedding certainty based multiple choice questions in the NPC modules to facilitate critical thinking and reflective learning in a highly demanding learning environment and present the results of a study to evaluate the usefulness of this approach.

Keywords: Prescribing, therapeutics, national prescribing curriculum, problem based e-learning, health professional students

Introduction

Prescribing is an important part of medical practice but may not necessarily be a strong focus in the training of medical students or other health professionals. There is evidence that e-learning has some effectiveness in prescribing education (Maxwell & Mucklow, 2012). In 2001, the National Prescribing Curriculum (NPC), a nationally standardised curriculum in prescribing, was developed for senior medical students in Australian universities (Smith et al., 2006). The user base of the NPC has diversified to include other health professional student groups such as pharmacy and nurse practitioners and it is also used by an increasing number of hospitals for junior doctors and professional bodies as a continuing professional development resource.

The NPC was based on the World Health Organization's Guide to Good Prescribing (de Vries, Henning, Hogerzeil, & Fresle, 1994). It currently comprises 28 modules covering common therapeutic topics. NPC modules have been designed to offer flexibility to the learner and are self-paced and the modules can be attempted individually or completed as part of small group work. In recent years with the improvement in technology, the focus of the NPC has shifted towards interactive activities. As an example, students can now see de-identified peer answers followed by expert feedback to allow them self-evaluate their performance.

Although the online environment offers unprecedented opportunities for the NPC in terms of accessibility and upkeep, attaining and measuring learning outcomes can be a challenge. Problem based learning (PBL), the primary pedagogical approach in healthcare education, fundamentally requires real-life case scenarios, interactivity and guidance to help learners develop and improve critical thinking, knowledge transfer and problem solving skills (Wood, 2003). The NPC covers the basic elements of PBL with clinical case scenarios and peers' comments which are followed by guidance from experts. To ensure that the NPC continues to meet increased expectations for it to be a one-stop resource for prescribing and therapeutics education in Australia and thereby remain relevant in future as an e-learning resource, innovative approaches are required to incorporate reflective learning and critical thinking into the resource.

Aim

The aim of this paper is to describe the findings from our evaluation of the usefulness of certainty based MCQs as a critical thinking and reflective learning tool in the NPC for students from multiple disciplines of healthcare.

Methods

The study was conducted at universities of Melbourne, Sydney and Tasmania. Ethics approval was obtained from the human research ethics committees of each participating university and written consent was obtained from all participants before their inclusion in the study.

A total of 83 medical, 40 pharmacy and 13 nurse practitioner students from three different universities completed a set of MCQs before and after completing an online module from the NPC using an iframed survey ("http://www.surveygizmo.com///,"). For each MCQ, students were asked to indicate how certain they were of their answer on a three-point certainty scale of low, medium and high (Figure 1). The certainty-based questions (Gardner-Medwin & Curtin, 2007) were used to assess the confidence level of students and to control for any overestimation of knowledge due to correct guesses. The MCQs were scored using a validated certainty-based marking scheme resulting in a composite score. Students were also asked to rate their perception of the usefulness of the MCQs and the certainty based questions as a learning resource. At the end of the post module MCQs, students were asked to provide their email address if they wanted personal feedback emailed to them.

Figure 1: An example showing how the MCQ and the certainty-based question were presented to the students on their computer screen. Students could not proceed to the next question unless they answered the MCQ and indicated the level of certainty for their answer.

For each question the students got correct, they received 3 marks if they were highly certain, 2 marks if the certainty level was medium and 1 mark for low level of certainty. Similarly, if the students got the answer wrong, they lost 6 marks if the students were highly certain that their answer was correct, 2 marks for medium level of certainty and did not lose any marks if they were uncertain of their answer. Students' responses were also grouped into six ordinal categories based on whether the answers were correct or incorrect at the three levels of certainty. The pre and post responses for a student were adjusted using generalised estimating equations. The Kruskal-Wallis test was used to analyse data on students' perceptions of the usefulness of NPC.

Results

In the survey, a significantly higher proportion of pharmacy students perceived the pre-module MCQs to be easy compared to the other students; however, they found the MCQs equally useful as a learning resource as the other groups. Furthermore, the marks obtained by individual pharmacy students were similar to the marks obtained by medical or nurse practitioner students at the pre-module stage. For the pre-module MCQs, there was no significant difference in the marks obtained by students who perceived them to be easy compared with those who did not ($p=0.7$). Almost all students found the post-module MCQs (97.1%, 132/136 students) and the feedback (94.9%, 129/136) to their answers to be useful learning resources. A substantial proportion (91.2%, 122/136) of students also suggested that completing the modules helped them answer the MCQs.

All student cohorts answered more MCQs correctly in the post-module phase compared to the pre-module phase. Significant differences were seen in the certainty levels of the answers for all student groups, with more of the MCQs answered correctly with higher certainty levels and lower levels of certainty in incorrect answers ($p<0.01$ for all groups; Table 1) However, across all groups, 39.4% (37/94) of the MCQs answered incorrectly with high levels of certainty at the pre-module phase did not improve at the post module phase. Only 8 medical students (5.9% of all students) asked for their personal feedbacks to be emailed to them.

Table 1: Student responses to the survey that the students had to complete after completing the post module MCQs

	Medical N (%)	Pharmacy N (%)	Nurse practitioner N (%)
Pre-module MCQs easy	10 (12.0)	16 (40.0)*	0 (0.0)
Pre-module MCQs useful	61 (73.5)	32 (80.0)	11 (84.6)
Completing NPC module helped answer MCQs	81 (97.6)	34 (85.0)*	12 (92.3)
Post-module MCQs useful	81 (97.6)	40 (100.0)	13 (100.0)

* represents statistically significant difference in comparison with the medical students

Discussion

In our study, certainty based MCQs coupled with certainty level helped gauge the level of overconfidence in the different student groups which would have not been possible otherwise. Pharmacy students saw a lesser need for certainty based MCQs and were more confident of their answers compared with medical and nurse practitioner at the pre module phase. However pharmacy students' performance on the pre module MCQs was not any better than the other two groups and the improvements in their knowledge was also similar. From a clinical perspective, it is not surprising that pharmacy students saw lesser relevance for the MCQs given that they would have received more pharmacology and pharmacotherapy training than the other students. Other studies have also found that pharmacy students tend to be overconfident in their self-assessment,(Austin & Gregory, 2007; Valdez, Thompson, Ulrich, Bi, & Paulsen, 2006) whereas medical students are said to be moderately able to self-assess (Danielle, 2011). If e-learning is to be expanded, identifying these types of issues is critical given that well-founded confidence of health practitioners enhances the delivery of health care but their overconfidence can potentially have undesirable consequences.

The embedded survey in the NPC modules allowed us to maintain anonymity of the data and de-link the MCQs from the module for the purpose of this study. However, it also meant that we were unable to provide instantaneous personalised feedback to students. As the survey tool was developed for research purposes, it did not offer the flexibility to combine responses and generate automated feedback. If personalised feedback is provided, overconfident students may have gained sufficient knowledge from the activity to improve their knowledge. Computerised personal feedback, which has been proven to have an impact (Zakay, 1992), would have been useful to incorporate but could not be done in our study due to programming limitations and ethics requirements. Students were offered email feedback within a week but very few took up the offer although previous studies have shown that learners are usually keen to receive feedback on their performance (Hattie & Timperley, 2007). Some students probably did not seek feedback because their performance in the study would not contribute to their university grades. However, if certainty based MCQs are implemented as a learning resource, it is essential to incorporate automated and instantaneous feedback for the MCQs to ensure that all students, including those who remain overconfident of their wrong answers even after completing the modules, learn optimally from the NPC.

In addition enhancing learning, certainty based MCQs can strike a balance between the ease of administering MCQs and the rigor of essay type questions in assessments. Incorporating certainty levels to the MCQs decreases the probability of a student correctly guessing the answer compared with the use of MCQs only from 25% to approximately 8%, thereby increasing the validity of the assessment process. Furthermore, the marking scheme disproportionately penalises wrong answers at higher certainty levels whereas students can guess without losing marks if they admit their uncertainty about the answer. The process of answering MCQs and indicating levels of certainty requires students to use higher level cognition compared with MCQs only as they have to think through the reasons for their answers in context. This adds a level of sophistication and accuracy to the assessment (Nicol, 2007) without losing the advantages MCQs offer in e-learning assessment (Govindasamy, 2001).

A characteristic limitation of certainty based MCQs is that a student who is reserved by nature can indicate a low level of certainty although they may be entirely sure of their answers. This may result in such students being inappropriately penalised with lower marks than they deserve for their knowledge. It is important to explain the grading system to students before using certainty based MCQs as an assessment tool to ensure that none of the learners are disadvantaged. It has been reported that students value this approach of marking if it is explained properly and they have ample time to practice before the assessment (Cook & Jenkins, 2010). Costs and the resource intensive process of developing algorithms for certainty based MCQs can also be a barrier to their usefulness in e-learning environments, particularly at universities where resources are limited. Resource implications can be further exacerbated if immediate personalised feedback is to be provided. Technical failures can also cause huge setbacks and detract learners if support is not readily available. With advances in technology however, it would be expected that computing issues can be resolved as they arise.

Conclusions

With the need for a streamlined prescribing education for multiple health professionals working in the same health system likely to grow in the future, incorporating certainty based questions in online modules increase their utility by encouraging self-reflection. The advantages of incorporating certainty based questions into online modules can also add value to other problem based e-learning courses on offer in university education for health professional students.

As an outcome of the study, pre- and post-module MCQs and the certainty based questions used in the study and another module on diabetes have been made available as an optional learning activity to all students enrolling in the NPC in 2012. Up until this paper was drafted in June 2012, approximately 75% of students who had signed up to the NPC modules had completed the MCQs. In addition to enhancing students' learning experiences, the MCQs will be used as an ongoing quality monitoring tool to ensure that the NPC is meeting the needs of its users. Data collected until the end of 2012 first semester will be analysed to further understand the utility of certainty based MCQs in a self-paced and primarily self-regulated learning environment for health professional students. The role of certainty based MCQs in facilitating critical thinking and reflective learning will also be reassessed on a larger and wider non-experimental sample to help devise more holistic e-learning strategies for health professional students.

Mobility makes us agile and lean: A new paradigm for institutional projects

Tim Klapdor
Charles Sturt University

The mLearn Project at Charles Sturt University (CSU) is an attempt to establish a new philosophy for large-scale institutional initiatives that borrows aspects from the technology companies based out of Silicon Valley. This paper will outline the concepts that have been adopted as well as the rationale for this change in tact. The project is running in 2012 and into 2013 over three teaching sessions and it is hoped will foster innovation through trials of technology, mobilising system access and developing mobile enhanced learning resources. Findings and reflections from the project will be published over the next 18 months.

Keywords: mobile, project management, mobile learning, mobile technology, university initiative

Introduction

How universities respond to technology is becoming a greater operational imperative, both financially and strategically. Traditionally universities have faced these challenges by developing large-scale projects that implement technology on an enterprise level. These projects are costly in time and resources and are often too big to react to a rapidly changing environment. Is this practice sustainable in an era where technology changes are rapid and evolving? How can universities act as future makers in a climate of rapid change?

Mobile is the latest technology to pose a significant challenge for higher education (New Media Consortium & EDUCAUSE Learning Initiative, 2012) and at CSU we have sort to meet this challenge through our mobile learning initiative, the mLearn Project. We have used it as an opportunity to invest in a smarter initiative that challenges the paradigm by focussing on achieving institutional goals through small-scale innovation and adapting processes and methodology commonplace in Silicon Valley. The mLearn project operates within a familiar project structure with a clear hierarchy of Sponsor, Steering Committee and Project Team and follows the normal reporting processes. The project philosophy however is shaped by the tech industry and this creates a number of key differences:

- The philosophy of the project aligns in many ways to the model outlined in the Lean Startup (Ries, 2011) and follows the core principle of **Build-Measure-Learn**. The project is Build oriented with a focus on outcomes and actions. It is planned that these outcomes will be used to Measure results, which in turn will allow the university to Learn.
- The project follows an **agile development process** (Beck, et al., 2001) with specific focus on user satisfaction, rapid delivery, tangible use, sustainable development, good design and simplicity. Regular adaptation to changing circumstances is also crucial to the success of the project.
- The project is **multi-threaded** with a number of concurrent areas of work. Rather than a number of small separate projects, these are all bought under the one banner that can make use of the cross over in knowledge and skills required.
- The focus is on encouraging **small-scale innovation** rather than large-scale outcomes. Innovation is seen as an incubator for ideas and a proving ground for new technology. By conducting real world pilots on a small scale it is hoped that they will be easier to support and that will provide lessons as to what works and what doesn't.
- Project involvement runs **across disciplines** and includes representations from most divisions and all the faculties. The aim is for innovation not to be siloed or restricted and allowed to compliment strategic goals throughout the university. Developers will work directly with users and stakeholders creating strong bonds between the needs of the users and the work being undertaken.
- A **new project requires new resources** and the project has setup a core development team with concentrated skills with 100 per cent allocation to the project. The group will work with a wide range of stakeholders in the traditional project team, which it hopes will reduce the drain on divisions. It also provides the capacity to recruit based on the skills required for the project and not those currently available.

Rationale

For many years Silicon Valley has shown that there is a viable alternative to traditional project management. For decades the technology sector has been dealing with the environmental factors that most universities now find themselves in - rapidly changing and financially challenging. These companies, in particular the start-ups like Facebook and Instagram, have employed different methods that encourage change and embrace uncertainty which allowed them to be able to adapt quickly and operate sustainably.

Small-scale innovation informs sustainable future development

This often falls under the banner of Research and Development (R&D) and it is vital to the development and introduction of new technology and developing new business. Google is one of the biggest companies and leading innovators in the world. They have adopted small-scale innovation as a successful incubator for future developments (Wojcicki, 2011). In an educational context it is much easier to support small-scale innovation, as it requires less resources and quicker turnaround times. Traditional projects tend to run over years but small-scale innovations can be run over sessions and they have the ability to change and adapt quickly, even midstream. Their size also allows for small changes in circumstances or unintended problems to be negotiated quickly and because of a narrow scope they can reduce inherent risks.

Support innovators rather than force change

Most technology companies invest their money with in-house research and encourage their staff to be creative and innovative. They incubate innovation from their staff because they know the business; they understand the clients and the available platforms. In universities we need to recognise teachers as future leaders for the same reasons - they know the students, they know the content and they know how to teach the course. What they lack are the support mechanisms. They need technical support to help make decisions and build a solution and they need access to technology. Encouraging teachers as innovators encourages a culture of change leadership and can assist in implementing an integrated and orchestrated top-down, bottom-up and inside-out strategy for change (Uys, 2007).

Implementation

The structure of the project follows traditions and conforms to the existing standard of governance established at the university. The Steering Committee provides leadership and strategic alignment through representation from key business areas. The Project Team contains stakeholders that provide business expertise. The project follows the existing reporting regime that tracks budget, milestones, risk, issues and overall progress.

A new addition to this structure is a small Development Team that consists of new staff who are allocated 100 per cent to the project. They provide the expert knowledge and skills required to carry out work on the project's objectives. Centralising staff allows these skills and knowledge to be shared across the different threads of the project. Technical and business knowledge is combined and provides a solid foundation for the project to work from.

To enhance the project it has also adopted some of the key Agile Development Techniques including:

- Individuals and interactions over processes and tools. The project is taking a user centred approach when delivering a solution. There is an acknowledgement of the importance of staff and students rather than the technology, and support and interaction is key.
- Working solutions over comprehensive documentation. The project definition document forms the central core of the project detailing aims, outcomes and delivery. Functional and business requirements are developed with the focus on getting it done not getting it right. Mistakes are part of the learning process and key to the **Build-Measure-Learn** philosophy.
- Responding to change over following a plan. The mobile space is a rapidly changing and evolving environment and there is a need to embrace these uncertainties and make them an asset to the project. In this manner we will work on delivering iterative solutions - *"You can launch something polished that is driven by assumptions, or you can test something rough that is powered by understanding."* (nickf, 2011).

Methodology

The mLearn Project will operate in the following areas:

- Conducting Device Trials
- Mobilising Key Learning & Teaching systems
- Enhancement of Learning Resources

Pilot Programs

Large-scale adoption of mobile technology is new and has no precedent so the aim of the project to gain knowledge, understanding and real world experience. This will be achieved by conducting real device trials with our students, our staff and our infrastructure. The pilot programs are small and will have a limited scope so multiple programs can be run at the same time. The small size makes it much easier to provide focussed support to staff and students and provides the ability to change and adapt to resolve issues on the fly with the aim of making it easier to manage risks. Shorter timelines dictate that less time is spent planning and more time doing, and with all the pilots there is a sense of exploring the possibilities rather than limiting them because of the risks involved. The project will be conducting pilots with a range of devices and will provide devices and support Bring Your Own Device (BYOD) initiatives.

Mobilising System Access

Mobile technology challenges all desktop-centric institutional systems. The mLearn Project is focusing on mobilising access to key student systems. It is not rewriting systems but ensuring that they are accessible and user friendly on a number of mobile platforms. With a focus on interface design and user experience the project aims to deliver improvements that are available to all students. The project will be working on an iterative model with direction from the Lean Startup project, undertaking a 'functions first, features second' approach. This includes the delivery of a minimum viable product (MVP) (Ries, 2011) to begin the process of learning as quickly as possible which will then be developed further through feedback and features added as required.

Develop Mobile Enhanced Learning Resources

Mobile technology opens up the possibility to change what learning resources are as well as challenge the traditional space they are used in. As a leader in distance education our university has experience in developing learning resources across a range of media. Mobile technology provides us with new opportunities and a viable alternative to print in terms of portability and accessibility. There is also the ability to create unique resources that leverage the capabilities of many mobile devices to play rich media and implement interactive elements. It also provides an opportunity to investigate digital publishing workflows and the concept of Create Once, Publish Everywhere (Jacobson, 2009). The project will develop a range of resources over its duration that explore these elements and provide real working examples.

Outcomes

From this work a number of outcomes are expected:

- The project aims to deliver specific actions to improve access to the learning management system, online evaluations, library services and deliver functional mobile enhanced learning resources. The device trials will hopefully provide an authentic experience of mobile learning practice in a variety of discipline areas with a range of different student cohorts including internal and distance education.
- The project will report on the impact and implications of mobile technology on students, academic staff, infrastructure, systems and support staff involved in the project. It is anticipated to report on some of the issues related to sustainability and access in the regions.
- The project will provide recommendations to senior management about the development and delivery of digital content for mobile devices, strategic direction for mobile technology related to learning and teaching and the general and large-scale deployment and support of mobile devices for learning and teaching.
- The project intends to develop resources and guidelines that can be disseminated to academics, students and the wider community in a number of areas including: good practice guidelines for the provision of learning and teaching using mobile devices in a range of different environments; the training and support materials for the devices and technology used in the project; as well as mobile pedagogies.

It is anticipated that these outcomes will provide clear benefits to the university in terms of improvements to student engagement and satisfaction, increased access to online learning systems, good practice in the use of mobile devices in learning and teaching practice, the development of rich mobile enhanced content and resources and sustainability in practices and production. The project will gather feedback through a number of surveys and focus groups and the experiences of the project team where successes and failures are expected. Analysis will be conducted to determine what worked well and what didn't to how this might be rectified in the future. This should feed through information for the development of clear strategic direction for mobile technology, device deployment models and digital resource development for learning and teaching.

Conclusion

Through the adoption of proven techniques from some of the most successful technology companies in the world, the mLearn project will explore an unconventional approach to the challenges and changes that new technology bring. Through the adoption of two key ideas, Build-Measure-Learn and the iterative approach from the agile development process, it is hoped that the project can respond to the many issues related to implementing technology in a milieu of continuous change. It is hoped that by taking this different approach we can demonstrate a platform for institutions to tackle some of the most important future challenges in a sustainable and timely manner - ensuring the role of Universities as a centre for future makers in a climate of rapid change.

The peripatetic learner - the role of mobility in the formation collaborative learning spaces

Judit Klein
Auckland University of Technology

The earliest notion of a university came from people walking through the streets of Athens thinking about how the world works and trying to understand it. Apple Distinguished Educator Dr. William Rankin from Abilene Christian University (2012) reframes this notion of the peripatetic learner, originating from Aristotelian philosophy, to describe how mobile technologies have brought about a new way of thinking about education. The ability to be mobile has implications in reshaping future learning: to rethink the spatiotemporal structures of formal tertiary education means to understand both the affordances and challenges. The disruption of traditional pedagogies enables new forms of collaborative interactions to occur. This paper considers how to define a learning space that is no longer constrained by the physical classroom. By taking a technological perspective and a mixed methodology, it aims to evaluate practices of harnessing mobility and collaboration through existing or potential applications on the mobile platform.

Keywords: mobile learning, mobility, tertiary, education, collaboration, disruption, technology

Introduction of concepts and literature

This paper introduces the critical concepts underlying the researcher's investigation of the potential applications of mobile devices and the impact of mobility on learning and teaching practice. Increasingly rapid developments in the field of mobile technologies have led to a growing interest in how such devices are being integrating into the field of education. Despite the fact that mobile devices are not designed specifically for use in learning and teaching, they have been embraced at all levels, from early childhood through to tertiary and higher academic study. Within the field of educational technology, the research addresses the implications of appropriating the mobile device in tertiary education, specifically, how to manage the inherent disruptions of establish practice. The objective of this research is to examine the role of the mobility in the formation of collaborative learning spaces, with the aim of evaluating best practices to overcome future challenges.

The area of 'mobile learning' has gained a lot of momentum in recent years and existing research provides current field of knowledge. This paper will use the definition suggested by Manuguerra and Petocz (2011) that refers to the next development of e-learning that has utilised the advantages of mobile phones and tablet computers as means of accessing content. When discussing the learning 'space', it is important to define it as separate from a 'place', which is a physical setting in which activities and experiences of living occur (Relph, 2007). This paper argues that the learning 'space' is no longer confined to any given 'place'.

Not long after its release in 2010, early adopters of the Apple iPad were already hailing the device as the 'game-changer' in education (Brown-Martin, 2010). Mobile technologies are quickly becoming seamlessly integrated in everyday life, and one of the biggest impacts it has had is in facilitating communication and connectivity. As this connectivity is brought into the classroom, it opens up possibilities for more collaborative pedagogies. The key topic of interest is this idea of the collaborative learning space. When referring to the affordances, this paper will use the definition provided by Dr. William Rankin (2012), where the mobile device brings together rich media, connectivity, and full access to the internet. When addressing issues of pedagogy, this paper will use the wide definition as the process through which one can acquire forms of conduct, knowledge and practice (Williamson, 2012). The term 'peripatetic' is used in reference to the teaching methods of Aristotle, teaching as he walked around the Lyceum: learning happen while moving from place to place and engaged in discussion about the world (Squires, 1999). This paper reframes the notion of the peripatetic learner in light of the affordances of modern technology that enables this same style of learning across contexts.

A range of academic papers and relevant texts were selected for this review and will used to examine the role of mobility and its implications. Key concepts to understand are mobility and disruption and the role they play in changing our conceptions of what a learning space is. 'A Theory of Learning for the Mobile Age' (Sharples, Taylor, & Vavoula, 2007) provides an overview of the current technological context that exists and how this context is informing educational practice. 'No Significant Differences Revisited' (Reeves, 2005) addresses the inherent issues that arise when evaluating the effectiveness of 'new' technology enabled teaching. Laurillard

(2008) examines ‘The Pedagogical Challenges to Collaborative Technologies’ seeking to exploit the collaborative potential of technology to enhance learning experiences. The literature will inform the research design and methodology by providing insight as to how these concepts can be applied to the technology to harness the potential of what mobility enables, rather than the negative conception of what is disrupted. This paper proposes that mobility has changed the notion of a 'learning space': it is no longer defined by the physical classroom. The research questions propose that the mobile device enables collaborative learning because their original purpose was to facilitate global digital communication (Sharples, Taylor, & Vavoula, 2007). By looking at this notion that the learner is mobile, the research seeks to best utilise mobile technologies to create these learning spaces and utilise their collaborative potential for more engaging learning experiences. This appropriation of technology ultimately results in a disruption of institutional structures so it is important to consider the effects of disruption and explore its implications.

The questions posed by the research are intentionally broad: the unpredictable nature of technology brings about many new phenomena and it’s course is unforeseen, therefore it is important be open to unexpected results. Sir Ken Robinson (2012) highlights that it can’t be predicted how technology will play against culture and how people will use it. He uses the example of the iPad: Apple opened up the facility for third party applications which has resulted in a vast range of apps for many possible uses. Though it is important to be informed by educational theory, this research offers a technological perspective by utilising the mobile development platform, as it is this platform which has enabled the iPad to be appropriated into the academic context. This paper provides a review of a concise selection literature based on the key themes of the research concerns. The selected authors provide insight to the existing knowledge and provide discussion around the concepts which are central to the research questions. The findings from the literature will be used to highlight the implications for research design and methodology.

Existing knowledge and conceptions

In a society where technological change is becoming exponential, there is growing interest in understanding the relationship between mobile technology and learning. As proposed by Sharples, Taylor and Vavoula (2007), the effectiveness of a new theory of learning depends on understanding this relationship. A Theory of Learning for the Mobile Age (Sharples, Taylor, & Vavoula, 2007) acknowledges that each era of technology informs educational practice. The current technological era is defined by mobility. As portable computers become ubiquitous, so too does knowledge. Learning is no longer constrained within the fixed time and space of the traditional classroom. The proposed criteria for a theory of learning for the mobile age offers relevant discussion into the key themes of the research questions posed by this paper. The authors propose that as we enter the age of global digital communication, the mobility of people and knowledge needs to be the focus of inquiry. In relevance to the research question, they put forward the argument that we can longer be assume that ‘learning’ takes place in the classroom mediated by a teacher. The most significant concept that emerges is that the appropriation of technology leads to new ways of learning and constructing knowledge, . The technology enables us to be more connected and through our communications, we create “impromptu sites of learning” (Sharples, Taylor, & Vavoula, 2007) to share understanding.

Despite the growing interest in the use of ‘new’ technologies in education, it is not a new idea to evaluate their effectiveness by comparing it to the ‘old’ or previous methods of classroom instruction. In a review of these media comparisons studies, Reeves (2005) calls for design research as a way to move past the “no significant differences” phenomenon. The proposal addressed the need to better develop and implement online teaching and learning environments by focusing on the broad problems critical to education achieved through collaboration among researchers and practitioners. The text is key for informing the research design and methodological approach required to avoid falling victim to the ‘no significant differences’ phenomena. Reeves provides insight into the existing field of research and offers a more appropriate framework for conducting research in the field of technology enabled learning. The effectiveness of technology enabled learning is hard to measure as the results are highly qualitative. The most significant concept to emerge from the reading is that the need for pedagogical change to achieve significant educational differences from the technological innovations.

To better exploit the collaborative potential of technology, Laurillard (2008) argues that it needs to be used for more adding logistical value to existing teaching methods. The technology needs to create something new rather than emulating the existing role of the reacher. The article identifies that collaborative technologies weren’t designed for use in learning and teaching so suggests a technology design process to find a better way to utilise them in this context. A human centered approach addresses the needs of the learner and teacher and looks to educational theory to understand the learning process. In relation to the research questions, the article looks to how the given collaborative potential of technology can be better utilised through a redesign of the pedagogical framework. The collaboration becomes more than an exchange of ideas, rather, the construction of a shared understanding of a concept. The most significant concept to emerge from the article is that traditional methods need to be explored in relation to the next context. Theory of online collaboration can be examined in the context of formal learning theory as a way to build a pedagogical framework.

Impact of mobile learning: catalysts for change

The role of mobility

A key focus of the research question is how the ability to be mobile creates opportunities for new kinds of learning spaces by removing the physical constraints of time and space. These constraints are inherently imposed by institutional structures that dictate when and where learning takes place. Sharples, Taylor and Vavoula (2007) argue that learning occurs outside of the classroom as engaging with our surroundings enables the formation of "impromptu sites of learning." They propose that mobility enables us to understand how knowledge and skills are transferred across context. Laurillard (2008) uses the example of a school field trip to highlight how learning activities move from being teacher driven to becoming learner centred. The article proposes that mobile technologies offer a richer learning experience by facilitating collaboration between students in site specific practices, bridging the gap between the physical distances. From a technological perspective, Reeves (2005) argues that in evaluating the effectiveness of educational technologies, the variance of hardware features is a factor often overlooked. That is to say, it also needs to be considered that unlike the physical learning space, the mobile one is subject to limitations of the technology.

In relation to the research question, it is evident from the literature that the notion of a learning 'space' is more ambiguous. As mobile devices blur the boundary between virtual and physical spaces by augmenting the physical with the virtual, our sense of place is altered. Aided by the prevailing medium of communication, electronic media transfers information around the globe in seconds (Relph, 2007); we are able to conceive of a learning space that is defined in broader terms that enables us to interact with remote people and places. With more learning taking place off campus, it becomes difficult to define learning spaces solely in terms of a physical building. It is suggested by the literature that the role of mobility is to form a 'space' that facilitates interactions with people and places beyond our immediate physical proximity.

Social, cultural, technological and pedagogical disruption

The appropriation of the mobile devices into educational can be described as having a 'disruptive' effect. This disruption occurs when the new methods of technology enabled learning create tensions with existing pedagogies. The main issue is the need to restore balance when the physical elements of the classroom and curriculum are taken away. Introducing the notion of a more ambiguous learning space disrupts the conceptions of the traditional classroom and Laurillard (2008) identifies the need to explore traditional learning methods in relation to the new context. As proposed by Sharples, Tayor and Vavoula (2008), this context is a society defined by mobility. The technology only becomes valuable when utilised in light of this new context and the new conceptions of space. This disruption seems unavoidable as ubiquitous use of personal technology leads to new expectations of learning as, like the device, it needs to be personal, user centered, networked and mobile (Sharples, Taylor, & Vavoula, 2008). However, Reeves (2005) argues that there is not enough known about the demands of online learning or how to best execute educational objectives. To address this disruption of pedagogy, it is useful to highlight the interrelationship between technology and society. Bijker (1995) argues that there is a need to analyse technical change as a social process: the mobile device has been appropriated into the educational community, but through this appropriation, the future development of the technology is shaped by this integration.

Conceptions of collaboration

One of the main affordances brought into education with the introduction of the mobile device is the networked capability which inherently brings about a more collaborative approach to learning. Collaboration is a common theme underlying the reviewed literature and provides insight into how it manifests within technology enabled learning. In proposing a theory of learning for the mobile age, Sharples, Taylor and Vavoula (2008) base their criteria on an approach that is centered around the learner, community and knowledge. Collaboration needs to be more than just an exchange of ideas, rather the construction of a shared understanding of a concept (Laurillard, 2008). When exploring mobility as a contributing factor to collaboration, the literature addresses the need for a pedagogical framework to truly utilise mobile technologies for collaborative learning. The collaborative potential of the device is easily lost when the mobile device is simply integrated as a tool for traditional teacher driven instruction. Rather, the spatial environments in which the tools are employed need to be taken into consideration.

Conclusion

This literature review set out to determine the current field of knowledge in the regards to the appropriation of the mobile device in tertiary education. Within the context of the research and in light of the technological perspective, the focus is on the modern 'peripatetic' learner: one who is mobile and gains understanding across contexts and through interactions with people across these spaces. The research aims to examine the role of mobility and the implications of pedagogical disruption brought about by the mobile device. One of the more significant findings to emerge is that though the collaborative potential of the iPad is recognized, the current applications add only logistical value that comes inherently with online learning. Working towards learning for the future, the research aims to go beyond these current applications and harness the power of mobility.

The future challenges of technology enabled learning are in the need for pedagogical change. It is evident that this change doesn't happen overnight and the introduction of technology enabled learning is still very new in comparison to long standing institutional structures. The aim is to be able to support the modern learner beyond the constraints of traditional instruction based pedagogy. To achieve this, it is important to explore that best possible way to utilize the technology in a balance between technology enabled learning and institutional requirements. The literature provides insight to the conceptions and approaches on how to conduct further research.

In light of the work that has been done already, there seems to be an opportunity to develop an interface, system, or software product through practice based research. By taking a technological perspective, the research aims to evaluate methods of harnessing mobility and collaboration, either through existing or potential applications on the mobile platform. The design of the research will address how collaboration can be facilitated through the mobile device. The practice will look at utilizing the Apple iOS platform, this includes related supporting software and hardware, native and third party applications, to be explored in both traditional classroom environments (i.e. lecture halls, studios) and outside of it. Participants should be able to be both physically and remotely present. The highly qualitative nature of learning makes it difficult to define, measure and evaluate the best possible way to utilise the power of mobility. The learning 'space' is becoming more of a conceptual signifier rather than a physical embodiment. It is important to remain informed by educational theory, but as the literature has indicated, to adhere to it doesn't address the affordances of the technological age we live in.

The creation of a 3D immersive, interactive space for experiential learning: VirtualPREX

Vicki Knox
DEHub, Faculty of the Professions
University of New England

Sue Gregory
School of Education/ DEHub, Faculty of the Professions
University of New England

VirtualPREX, or, virtual professional experience, is the term used to describe a 3D virtual world classroom designed for pre-service teachers to practise their teaching skills and use the interactive resources to create immersive experiences to assist their learning. Outlined in this paper is how and why the space was created for the pre-service teachers. Also described and explained are the adjustments made to the space to enable a richer experience for pre-service teachers to role-play and practise their teaching prior to taking the skills to the real classroom.

Keywords: VirtualPREX, Second Life, virtual worlds, professional experience

Introduction

VirtualPREX, virtual professional experience, is a research project that explores this aspect of pre-service teachers' (PSTs) education using Second Life (SL) as their medium. The authors discuss the creation of the VirtualPREX classrooms, avatars and resources as a 3D interactive space for PSTs to practise their teaching through experiential learning. In 2010, the authors, part of a team of eight, received a two-year Office for Learning and Teaching (OLT) grant titled: *VirtualPREX: Innovative assessment using a 3D virtual world with pre-service teachers*. The project's aims are:

> to investigate the design and implementation of a 3D virtual environment to facilitate effective formative assessment of teaching practice, in order to assist pre-service teachers to acquire a better range of professional skills and better confidence in, and more realistic awareness of, their skills before being placed in real life classrooms (Gregory & James, 2011, p. 1).

The focus of this paper is on the construction of the VirtualPREX 3D classroom environment. We provide an overview of the underpinnings of the project, followed by a brief literature review on virtual worlds, Second Life and experiential learning. We then discuss the conceptualisation and design of the classrooms, including their construction and population. We conclude with future uses of the VirtualPREX classrooms. This paper can be used as a resource to enable other educators to use and create a space such as the VirtualPREX classrooms.

Background and overview

Simulations are increasingly being used in education for PSTs to prepare for real life teaching experiences (see Carrington, Kervin, & Ferry, 2011; Foley & McAllister, 2005; Girod & Girod, 2006) and these simulations have been extended to virtual worlds (Cheong, 2010; Mahon, Bryant, Brown, & Kim 2010; Fluck & Fox, 2011). However, these studies have not resulted in the development of a shared space "for use by pre-service teachers in their own time or with peers/educators to practise classroom teaching and management skills" (Gregory & James, 2011, p. 6). Development of such a shared space can be very time-consuming and expensive. The VirtualPREX project has created a sustainable simulation of 3D virtual classrooms that will be freely available from 2013 and beyond.

VirtualPREX is an innovative, forward-looking project that is designed to enable PSTs to "practise their classroom teaching skills through role-play, learning, teaching, evaluation, reflection and self/peer/educator-assessment" (Gregory & James, 2011, p. 1) in a setting which is low risk and can be used repeatedly, synchronously and asynchronously. Teachers can bring all their skills together including theory and practice into the one teaching and learning environment (Carrington et al., 2011). The quality and quantity of available access for PSTs to classroom professional experience has proven difficult (Barbousas & Nicholson, 2009). VirtualPREX aims is to address this problem by providing PSTs with an alternative space to hone their teaching skills prior to embarking on their professional experience.

Literature Review – Second Life and Experiential Learning

SL is one of over 200 virtual worlds available (Gregory et al., 2010). A virtual world is a 3D electronic presence that imitates real life through an avatar (a graphical representation of themselves in the virtual world). SL has had a wide uptake across the educational sector due to its range of features such as the ability to move and interact with others through communication tools that "affords a sense of self and presence which may result in immersion and support socialisation and collaborative learning" (Girvan & Savage, 2010, p. 347). There has been limited research in the areas of interactive simulations using virtual worlds as an educational resource (Graves, 2008). VirtualPREX has been using and researching virtual worlds for simulations through role-plays in an authentic learning environment. VirtualPREX uses a combination of graphics, text and audio communications enabling users to interact with other people and objects in the virtual world and to "experiment with simulated real-life scenarios without real-life consequences" (Gregory & James, 2011, p. 6).

In the VirtualPREX environment PSTs access knowledge through experiential learning. The founders of experiential learning were John Dewey, Kurt Lewin and Jean Piaget, but Kolb described the methodology as "immediate, concrete experiences" (cited in Miettinen, 2000, p. 54). Experiential learning is learning by experiencing or, more simply, learning by doing. It is a holistic method of learning. VirtualPREX has been using the experiential methodology to underpin PSTs learning experiences by giving them an immediate, concrete experience in undertaking their role-play activities.

Conceptualising and designing the VirtualPREX classrooms

In 2009 two members of the project team trialled virtual classroom role-plays in SL (Gregory & Masters, 2012). SL was chosen as the University of New England owned one-third of an island; Australis 4 Learning. When designing VirtualPREX, it was decided to build the classrooms 300 metres in the sky above the existing classroom as there was no space left on the ground level. A teleporter (location mover) was placed for easy access. Considerations in the design of the VirtualPREX classrooms were:

1. The classroom was to be an immersive environment for experiential and authentic learning. Therefore, it should be recognisable to users as a representation of a "normal" primary public school classroom where PSTs could practise or be exposed to real-life scenarios that they might encounter in a real-life classroom. The classroom had to display materials found in a real classroom; bright colours on walls e.g. posters and many resources such as interactive books, chalkboard, reading mats and not be too formal.
2. PSTs were provided with teacher and school children avatars to increase the immersiveness of the experience, and the authenticity of being in a classroom. Child avatars had to be created that appeared authentic i.e. they had to look, act and dress like real children, and animate like real children (see Figure 2). Teacher avatars had to be unique but created in a way so that it was obvious which classroom they belonged to. They had to be made to look casual but professional.
3. The classrooms had to be located in such a way that participants in nearby classrooms could not hear the teaching and/or conversations in another classroom.
4. The size of the desks and chairs had to be proportional in size to child avatars.
5. A variety of interactive tools would be required to use by teachers or students when undertaking role-play activities. These included interactive tools on desks, walls, floors, in the avatar's inventory or through a HUD (Heads Up Display – with clickable toggle switches to activate gestures by the avatars).
6. Each classroom created had to be unique so it was easy for PSTs to establish which one to go to. However, the classrooms also had to be similar so that each PST would have the same experiences.

Classroom Construction

Constructing the classrooms on Australis 4 Learning was comparatively low-cost. One-third of the island cost US$1,180. Several objects were purchased through SL Marketplace, including many free purchases. The classroom purchased for VirtualPREX (US$5.41) was one that could be modified and copied. Four coloured classrooms (red, yellow, blue and green) were created from this purchase. Included in the classroom purchase were furniture, classroom desks and chairs, chalkboard, school bell, clock that could be set to any time zone, customisable corkboard and a pencil giver (that is, when clicked the avatar was given a pencil which was placed in their inventory), modifiable classroom posters and a classroom plant that could be changed. Figure 1 shows the VirtualPREX classrooms. Each classroom was built to accommodate a teacher (the option of male or female was available) and 10 students (five male and five female). The area between the classrooms has potential for further development to incorporate outdoor activities. The classrooms were colour coded to enable ease of use. If someone were to say "meet me in the yellow classroom", one would know immediately which classroom was suggested. The layout of the classroom is as per a typical classroom found in many schools, with two students sitting together and a teacher desk out the front. The current structure is the layout of the classroom as it was purchased with slight modifications. Future classrooms will have the option of differing configurations for the desks and the PST will be able to choose which configuration would be most suitable for their lesson.

In 2011, Phase 1 of the project, a pilot study was conducted to test the efficacy of the VirtualPREX classrooms. Seventy-two on-campus PSTs participated in role-play scenario workshops where one PST presented a 7-minute teaching episode and their peers role-played primary students using teacher and student avatars. PSTs completed a survey answering questions on the role-play and the classroom environment in which it was located. They also participated in a reflection session on the workshop. Results from these two activities showed that PSTs thought that VirtualPREX was a promising environment to prepare them for their professional experience, however, results were mixed and a number of renovations and adjustments were made to the classrooms and the avatars due to their feedback (see Gregory et al., 2011, for further details of this study). Adjustments were made and the environment was retested with 82 on-campus PSTs in 2012, Phase 3 of the project. Phase 2 of the project was the creation of bots (non-player characters) to enable PSTs to asynchronously practise their teaching with pre-programmed child avatars (see Reiners, Gregory, & Knox, forthcoming).

Figure 1: The VirtualPREX classrooms – Phase 1 and Phase 3

The location of the classrooms was changed from Phase 1 to Phase 3 to allow access by large groups of PSTs at the same time and to allow Local Chat to be used instead of Group Chat. In Figure 1 (bottom left) the red classroom is between the green and blue classrooms. The red classroom was moved to the other side of the yellow classroom (bottom right) to provide more distance between all the classrooms. The green classroom was also recoloured so that it was not so dark when inside. From feedback, the classroom table and chairs were resized for better proportionality and increased visibility of the students. More interactive tools were bought for the classroom for Phase 3, including a chalkboard where anyone, teacher, student or visitor, could write on the board. This assisted in teacher roles where they could write the name of the lesson, or their name, on the board. Dice were added to the list of resources available which meant that teachers could have lessons or games based on mathematics. Reading and writing animations were also supplied to the child avatars so they appeared to be actively participating in the lesson. A reading mat was added so that teachers could use this as a reward or as a time-out area. Larger interactive dice were added to the classroom as a place where the students could play games such as “Peas Porridge” or “Facepalms”.

Teacher and student avatars

Forty child avatars were created, ten for each classroom. Each child avatar has a colour-coded school uniform corresponding to their classroom so that PSTs instantly know where their avatar belongs. Initially, in Phase 1 of the Project, the avatars were mostly smaller versions of adults wearing a coloured polo shirt and cargo pants. After the completion of role-plays with on- and off-campus PSTs in 2011, it was decided to update the student avatars’ appearance and uniforms for Phase 3. The original school uniforms came with the classroom. However, these were not copyable or transferable and each avatar had to purchase (for zero dollars) the uniform. The shirt was changed to the colour of the student’s classroom. Figure 2 shows a selection of the child avatars and the four different coloured school shirts. The cost to upgrade the child avatar’s look was around US$2.00 each.

Figure 2: Phase 3 - VirtualPREX child avatars – school uniforms colour coded for their classroom

Preliminary Feedback from the upgraded Phase 3 VirtualPREX role-plays
Feedback from Phase 3 of VirtualPREX was very positive. Some of the PSTs thought the best thing about the activity was "being able to consider unexpected occurrences within the classroom and approaches in how they can be overcome", that they could connect to a group of people in a casual environment where learning still occurred and being "put on the spot" provided a good understanding of professional experience. Most PSTs thought VirtualPREX would be helpful in preparing them for their professional experience and they responded that it enabled them to realise the behavioural issues that may occur within a classroom and that it was good to experience a classroom environment without a classroom. One student responded that they felt the only way to become confident with teaching was through first hand experience and did not think it would be helpful.

Discussion and future uses of the VirtualPREX classrooms

Two important issues with creating spaces for teaching and learning in a virtual world such as SL is expense and time. VirtualPREX was relatively inexpensive although considerable time was taken to create the space. In 2013, VirtualPREX will be open for all educators to use with their students. Therefore, the time and expense to create the learning environment has been eliminated. VirtualPREX, by providing classrooms in the innovative and emerging technology of Second Life, can be used to reinforce and practise fundamental teaching skills. Teacher educators can integrate it into their academic programs as an adjunct to lectures and as a means of supplementing their students' professional experience before entering the real-life classroom. A blueprint for how to use, develop and implement VirtualPREX will ensure resource sustainability. Educators world wide will have access to VirtualPREX which will be available from the website: http://www.virtualprex.com.

The increased availability of smartphones[1] with Internet capabilities has led many educators to consider their potential for delivering mobile learning materials to students. In 2009 and 2010 three case-based scenarios were developed for mobile devices by staff at the University of Sydney and The Children's Hospital at Westmead. A trial of the pilot scenario was held with fourteen medical students in late 2009. The students were positive and made recommendations for improving the case scenarios. Their suggested changes were incorporated into phase two scenarios in 2010. Throughout 2011 evaluations were conducted with a total of 171 students and quantitative analysis of the data was performed. Results indicated that whilst students liked the mobile cases, they did not utilise them as mobile resources as anticipated. Some differences were also revealed between the digital immigrants' and digital natives' interactions with the case scenarios, as well as some variations between male and female students.

Keywords: mobile learning, case-based elearning scenarios

Introduction

The first decades of the 21st century herald interesting times for both educators and students. Learning and teaching in tertiary education is shifting from structured learning environments such as lectures and tutorials into a new mode of 24/7 access to learning anytime and anywhere, limited only by the flexibility of resources made available to students by their institution.

Case-based learning is a well-established methodology in medical education (Mostaghimi et al. 2006). It can help students develop critical reasoning skills, the ability to acquire and evaluate information, the capacity to generalise and transfer knowledge, and become lifelong learners (Mostaghimi et al. 2006; Ludmerer 2004). Ultimately, case-based learning enables students to translate what they have learned from the basic sciences to real-life clinical situations (Reese 1996). Information technology can enhance learning by enabling students to rapidly incorporate information into clinical practice (Mostaghimi et al. 2006) and can improve learning through case-based scenarios (Reese 1996).

At Sydney Medical School, case-based learning in the form of Problem-Based Learning (PBL) has been a feature of the teaching curriculum since 1997. Following a review of Sydney Medical Program, in 2009 the

[1] Smartphone: a high-end mobile phone that combines the functions of a personal digital assistant (PDA) and a mobile phone. Source: http://en.wikipedia.org/wiki/Smartphone

number of PBL cases was reduced to make way for additional teaching in foundation anatomy and physiology. Three of the discontinued PBL cases formed an important part of the curriculum of the Discipline of Paediatrics and Child Health and academic staff wanted to continue to provide learning resources based on these cases for students.

In 2005 – 2006, case-based learning was developed for the iPod for medical students at the University of Adelaide by Palmer and Devitt (Palmer & Devitt, 2007). By 2009 global developments in mobile phone and mp3 player technology were hard to ignore. The iPod Touch, the first iPod with wireless connectivity, had been available globally since September 5, 2007[2] and smartphone use in general was increasingly visible among the medical student cohort in tutorials. There was now a generation of students that 'have spent their entire lives surrounded by and using computers, videogames, DVD players, videocams, eBay, cell phones, iPods, and all the other toys and tools of the digital age' (Prensky, 2001, p. 1). With the Palmer and Devitt model in mind and an enthusiastic student cohort, the academics within the Discipline of Paediatrics and Child Health decided to explore the potential benefits of mobile learning for the discontinued course material.

Support was provided by Apple, Sydney eLearning (the University of Sydney's central elearning support unit) and the Manager of Web Development at Sydney Medical School to develop the paediatric case-based learning scenarios as mobile cases. The project goal was to provide these learning materials as a mobile resource to enable students undertaking the Child and Adolescent Health specialty block (CAH) to review and reinforce their learning under the Basic and Clinical Sciences and Patient-Doctor themes, as well as their clinical reasoning skills, when they were away from a desktop computer and the structured learning environment.

This paper reports on research conducted with students who undertook CAH at The Children's Hospital at Westmead Clinical School in 2011. We aimed to discover students' attitudes towards usability, content and access, as well as the perceived benefits.

The Project

The mobile case-based learning scenarios were developed for medical students who each year undertake CAH as part of the Sydney Medical Program. The initial mobile case developed in 2009 mirrored medical students' PBL tutorials. It contained the presentation of an adolescent patient with Anorexia Nervosa, constructed from a slide show with accompanying audio file, and an unfolding case description. It also contained interactive true/false and checkbox-style questions with automatic feedback, designed to engage the students in the associated reading material, lectures, references and web links. The case was developed using HTML, with Hot Potatoes freeware for the questions.

In October-November 2009, a trial of the pilot mobile case was held with 14 medical students with approval from the University of Sydney Human Research Ethics Committee. Students were provided with an iPod Touch, loaned by Apple, with the case pre-loaded. Students were given an orientation to the mobile case and the iPod Touch. The eight students who participated in a follow-up evaluative survey and focus group favoured the mobility of the elearning device. The students were positive about the potential use of the iPod Touch for learning and made useful recommendations for improving the mobile case and developing elearning materials on mobile devices. Students reported that they liked, "just having it all at your fingertips - portable," and the "freedom to do [self-directed study] whenever and wherever."

The project team was keen to address student feedback when developing the phase two mobile cases in 2010. Consequently, student requests for a more structured narrative flow and integrated questions, along with an improved graphical user interface, were incorporated into the second and third mobile cases on Rubella and Phenylketonuria. A 'resume' function, which allowed them to 'bookmark' their place in the case, cumulative scoring of questions and a cleaner interface were included in the new design. The content was written to mirror an authentic clinical reasoning process, as if students were participating in a Clinical Reasoning Session tutorial (CRS tutorial), mirroring real life clinical practice with patients. Questions were all single best answer multiple-choice. A pre-case quiz was developed to engage students in the topic and more references to online publications were incorporated. The case was developed using CSS3 and HTML5. They utilised the HTML5 capabilities of the Safari mobile browser to allow students to 'store' the web pages in their device for later use, or in an offline situation, such as at the patient bedside or whilst on public transport. The multiple-choice questions were built in JavaScript and scores and repeated attempts were recorded. The pilot mobile case on

[2] http://en.wikipedia.org/wiki/IPod_Touch

Anorexia Nervosa was redeveloped in the new style. The download of the mobile case was significantly improved to facilitate access by students with their own devices.

Methodology

In 2011 research was conducted with 175 students who undertook CAH over three of the four eight week terms that were held that year. Students were briefed on how to use the mobile cases during their orientation to CAH. Students worked through the mobile cases during the term on a loaned iPod Touch, their own mobile device or a desktop computer in the hospital or their own homes.

In order to evaluate the mobile case-based learning scenarios, a survey was developed and approved by the University of Sydney Human Research Ethics Committee. It comprised both quantitative Likert-type questions and qualitative items. On completion of CAH, students were asked to complete the paper survey (see Appendix 1).

Ten survey questions were analysed for this paper. They used a five-point Likert-style rating with standard 1= ‘strongly disagree’ to 5 = ‘strongly agree’ (see Table 1). The questions were grouped into four themes for further analysis: usability, content, access and perceived benefits for students.

Table 1: Balanced five point Likert scale with middle category as neutral

Scale	1=	2=	3=	4=	5=
	Strongly disagree	Disagree	Neither agree nor disagree	Agree	Strongly Agree

Methods of analysis using mean and standard deviation based on parametric testing procedures are often used for analysis of Likert scale data. However, non-parametric procedures based on the rank, median or mode are appropriate along with distribution free methods (Allen, 2007), and these were used.

Results

Of the 175 students who undertook CAH, 171 students participated in the survey, providing a 98% response rate. We present an overall analysis of the responses, then more detailed analysis based on reported student gender and age, and the type of web-enabled device used by students.

Scale items 1 and 2 (‘strongly disagree’ and ‘disagree’) and 4 and 5 (‘agree’ and ‘strongly agree’) were combined for analysis. A summary of responses to survey questions 1 – 10 is presented in Table 2. The median and mode for each question is presented as a measure of central tendency.

Survey respondents did not complete all questions. While 136 of the 175 students answered question 1, there was a greater response for other questions, such as question 3 – question 9, with 142 student responses. Regarding demographic details, 171 students gave their age and 169 their gender.

Shapiro-Wilk test results (between 0.762 to 0.876) suggest the data is not based on a normal distribution for each of the samples grouped by usability, content, access and perceived benefits to students (with p-values < 0.05). Also, approximately 74% of the group are 28 years of age or less, meaning the size of the sample for the digital immigrants is smaller than that for the digital natives. The sample size for the digital immigrants is less than 10 for questions 2 and 3, in which significant differences were found between the two groups. However, sample size issues do not arise for other tests based on digital natives or those tests based on gender and type of mobile device.

The Mann-Whitney U test was used as a non-parametric measure of central tendency. It is suitable for comparing small groups, with ordinal variables and when the distribution is asymmetrical (Nachar, 2008).

Table 2: Measures of central tendency and percentage agree for sample

	N (Valid)	Median	Mode	Percentage strongly agree or agree	Neither agree nor disagree	Percentage disagree or strongly disagree	N=
Q1 - The case-based scenarios for mobile devices were easy to use.	136	4.00	4	57.4%	32.4%	10.3%	136
Q2 - I found the structure of the CRS tutorials easy to follow.	141	4.00	4	83.0%	14.9%	2.1%	141
Q3 - I had no technical difficulties working through the cases.	142	4.00	4	69.7%	9.2%	21.1%	142
Q4 - I answered all the questions in the cases and read the explanations.	142	4.00	4	66.9%	16.2%	16.9%	142
Q5 - I read through all the learning topics.	142	4.00	4	56.3%	13.4%	30.3%	142
Q6 - I viewed all the lectures.	142	4.00	4	53.5%	6.3%	40.1%	142
Q7 - I worked through the cases during free time while on clinical attachments.	142	4.00	4	57.0%	10.6%	32.4%	142
Q8 - I worked through the cases while travelling to and from clinical attachments.	142	2.00	2	33.8%	11.3%	54.9%	142
Q9 - I revised my knowledge by working through the cases.	142	4.00	4	73.2%	12.7%	14.1%	142
Q10 - I learnt new information from the cases.	140	4.00	4	82.1%	9.3%	8.6%	140

The ten questions were grouped into four areas for overall analysis:

1. Usability (questions 1 – 3)
2. Content (questions 4 – 6)
3. Access (questions 7 – 8)
4. Perceived benefits for students (questions 9 – 10)

With regard to usability, the students' responses were mixed, with 57.4% strongly agreeing or agreeing with question 1 that the mobile cases were easy to use, 83% strongly agreeing or agreeing with question 2 that the tutorials were easy to follow and 69.7% strongly agreeing or agreeing with question 3 that they had no technical difficulties working through the mobile cases. On the questions related to content (questions 4 – 6), students were more positive about the quizzes (66.9%) than the learning topics (56.3%) and lectures (53.5%).

In terms of accessing the materials, just one-third (33.8%) of students used the mobile cases while travelling and 57% of the students reported using the mobile cases in their free time (questions 7 – 8).

In the final two questions (9 – 10) on the perceived benefits, students were positive about the benefits of the mobile cases for knowledge revision, with 73.2% strongly agreeing or agreeing with this question. In terms of learning new information, the students rated the mobile cases highly, with 82.1% strongly agreeing or agreeing with this question.

Gender Difference

Of the participants, there were 89 males (52% of total students), and 80 females (46.8%). Two respondents did not identify their gender. Table 3 summarises the responses for each question by gender.

Table 3: Summary of results by gender

Asymp. Sig. (2-tailed)	0.559	0.051	0.767	0.535	0.825	0.694	0.049	0.14	0.591	0.523
a Grouping Variable: gender (1=male 0=female)										

We observe a difference between the two groups for question 2 at the 10% level of significance, with a p-value = 0.051. Approximately 89% of females agreed that the structure of the CRS tutorials was easy to follow, compared to only 77% of males. Question 7 also demonstrated a significant difference, with a p-value = 0.049 at the 5% level of significance, where approximately 68% of females agreed that they worked through the mobile cases during free time while on clinical attachments, compared to only approximately 46% of males.

Age

The age range of the sample group was 21to 51 years and the mean age 27 years, with 90% of the sample aged 30 or below. Approximately 75% of the sample were aged 28 or below. The median age was 26 years, with a mode of 25 years. The age profile in the sample therefore follows a non-normal distribution, however, it is to be expected as Sydney Medical Program is graduate entry.

In order to test for a ‘digital native’ distinction, we separated the sample into two groups based on Prensky’s classification of ‘digital immigrant’ and ‘digital native’, with ‘digital immigrants’ being those born before 1980 (aged 32 years and above) and ‘digital natives’ born after 1980 (aged 31 or below) (Helsper & Eynon, 2009). We then tested for differences between these groups for questions 1 – 10 and have reported p-values (Sig 2-

tailed). As the beginning of the digital native generation is not clearly defined, sometimes starting in 1980 and sometimes 1982 or 1983, the test is repeated for generations born 1980 to 1984 (age range 28 to 32).

Analysis using the Mann-Whitney test showed that for those aged 28 years or below, there is a statistically significant difference in relation to question 8, with p-value < 0.019 (see Table 5). At the 10% level of significance, there is also a difference for question 1. Digital immigrants scored the higher mean rank in the Mann-Whitney U test for those aged 29 years or higher in relation to questions 1 and 8. This suggests the digital immigrants were more likely to have found the mobile cases easy to use and were more likely to have worked through the mobile cases while travelling compared to the digital natives.

Table 5: Mann-Whitney Test: Digital natives vs. digital immigrants

0 =28 or below 1=29 or above		**N**	**Mean Rank**	**Sum of Ranks**
Q1 - The case-based scenarios for mobile devices were easy to use.	0	99	64.80	6415.50
	1	37	78.39	2900.50
	Total	136		
Q8 - I worked through the cases while travelling to and from clinical attachments.	0	104	66.83	6950.00
	1	38	84.29	3203.00
	Total	142		

Another significant difference was found for the group aged 32 and above (see Table 6). The ‘digital natives’ scored the higher mean rank and were more likely to find the structure of the CRS tutorials easy to follow and to have answered all the questions and read the explanations. These results are significant at the 5% level of significance, with p-values = 0.034 and 0.028 respectively for question 2 and question 4. For the group aged 30 years or below, a significant difference was also found on question 4. This was also significant at the 5% level of significance, with p-value < 0.047.

Table 6: Mann-Whitney Test: Digital natives vs. digital immigrants

0=31 or below 1=32 and above		**N**	**Mean Rank**	**Sum of Ranks**
Q2 - I found the structure of the CRS tutorials easy to follow.	0	131	72.65	9517.00
	1	10	49.40	494.00
	Total	141		
Q4 - I answered all the questions in the cases and read the explanations.	0	132	73.43	9693.00
	1	10	46.00	460.00
	Total	142		

The groups aged 32 years or below and 33 years and above were also statistically significant for questions 2 and 6 (see Table 7). Digital natives scored a higher mean rank for both questions. Both were statistically significant at the 5% level of significance, with a p-value < 0.010 for question 2 and p-value < 0.049 for question 6.

Table 7: Mann-Whitney Test: Digital natives vs. digital immigrants

0=32 or below 1=33 or above		**N**	**Mean Rank**	**Sum of Ranks**
Q2 - I found the structure of the CRS tutorials easy to follow.	0	134	72.66	9736.00
	1	7	39.29	275.00
	Total	141		
Q6- I viewed all the lectures.	0	135	70.01	9451.00
	1	7	100.29	702.00
	Total	142		

Based on these results, we observe again that digital natives were more likely to have found the structure of the CRS tutorials easy to follow. Based on question 6, digital immigrants were more likely to have viewed all the lectures. These results are at the lower limits for sample size when this partition is applied to results.

Type of web-enabled device

Results show that 87 students were accessing cases on an Apple device (iPhone, iPad, iPod Touch), while 30 students were using other brands. Usability experience is highlighted by question 1 (whether the scenarios for mobile devices were easy to use) and question 3 (any technical difficulties working through the cases). Figure 1 shows the types of mobile devices used by students for the case studies:

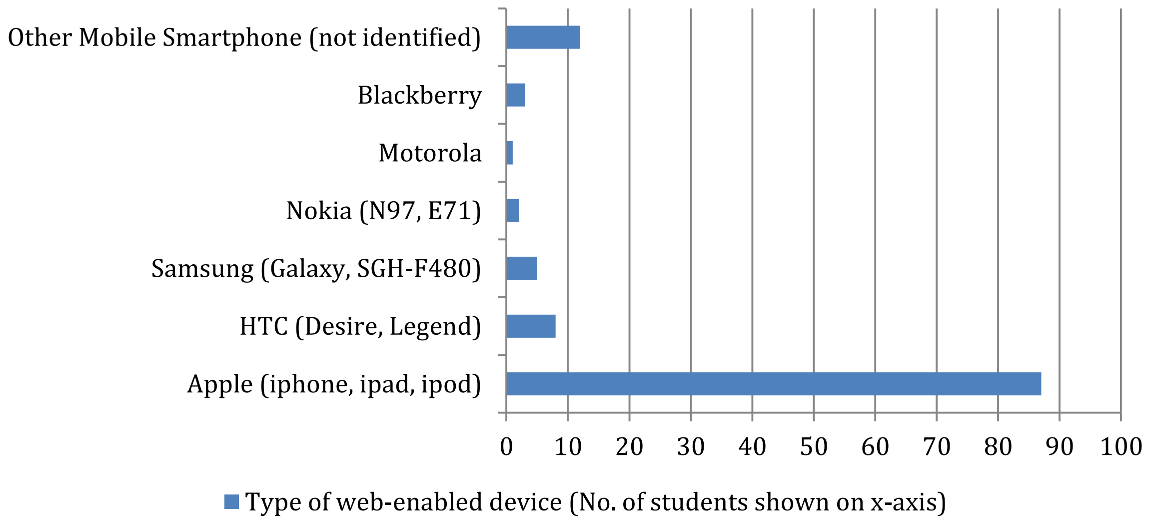

Figure 1: Type of web-enabled device

Attitudes on usability were mixed, with 57.4% strongly agreeing or agreeing with question 1 and 69.7% strongly agreeing or agreeing with question 3 (see Table 2). One reason for this may have been that the experience of the student was different based on the type of device they used. For example, students using Android/Google-based smartphones may have had difficulty as the mobile cases were designed to run using the Safari browser on an Apple device. To test for this, we examined whether the experience differed depending on whether the user had an Apple device or other handheld device or smartphone. The Mann-Whitney U test findings suggest there is no real difference between the experience of Apple and non-Apple users (see Table 8).

Table 8: Mann-Whitney U test based on type of device: Apple users versus other device

Dummy variable by type of device (where 0=Apple and 1=not Apple)	**Mann-Whitney U**	**Wilcoxon W**	**Z**	**Asymp. Sig. (2-tailed)**
Q1 - The case-based scenarios for mobile devices were easy to use.	816	3517	-0.538	0.591
Q2 - I found the structure of the CRS tutorials easy to follow.	793.5	3643.5	-1.735	0.083
Q3 - I had no technical difficulties working through the cases.	866.5	3792.5	-1.067	0.286
Q4 - I answered all the questions in the cases and read the explanations.	978.5	1329.5	-0.079	0.937
Q5 - I read through all the learning topics.	979	1330	-0.075	0.941
Q6- I viewed all the lectures.	772.5	1123.5	-1.717	0.086
Q7 - I worked through the cases during free time while on clinical attachments.	812.5	3738.5	-1.449	0.147
Q8 - I worked through the cases while travelling to and from clinical attachments.	884.5	1235.5	-0.832	0.406
Q9 - I revised my knowledge by working through the cases.	966.5	1317.5	-0.188	0.851
Q10 - I learnt new information from the cases.	944	1295	-0.281	0.779

a. Grouping Variable: type of device 2 (0=apple 1=other handheld)

The only significant differences between Apple and non-Apple users was for question 2 (in relation to the structure of the CRS tutorials) and question 6 (I viewed all the lectures). This was significant at the 10% level of significance. The result for question 6 may be explained by the delivery of lectures via iTunesU and the difficulty in accessing this on non-Apple devices. There is no difference between groups in relation to ease of use or technical difficulties. This is an unexpectedly positive outcome, given that the design and development of the cases was solely focused on the Apple iOS.

Discussion

The results revealed some interesting insights into where the mobile case-based learning scenarios were used, the students' preferred structure and the generational differences in approaching the mobile cases. These factors may assist educators in their design of similar learning materials in the future.

One of the goals of this project was to provide these mobile cases to students on mobile devices so that they could review and reinforce their learning while away from the structured learning environment. Despite this, just one-third of students used them while travelling. The geographical location of The Children's Hospital in Westmead (a suburb about 45 minutes by train from the Sydney CBD) may be a factor as students may drive rather than take public transport. It may not have been as practical for students to use the mobile cases in transit as we had anticipated. In terms of using the cases in 'free time', over half (57%) of the students agreed or strongly agreed with this. This concurs with Sutton-Brady et al's analysis that students have a preference for studying in a familiar home setting '…in reach of other learning related tools and resources...' (Sutton-Brady, 2009). From anecdotal evidence and the qualitative findings from this survey, not presented here, the students' low ratings for this question may be due to issues they encountered when using the mobile cases on hospital computers with Internet Explorer or Firefox browsers. Since the mobile cases were not designed for web browsing on a computer, these students would have had a less than optimal experience.

Students showed a strong preference for the clinical content (as represented by cases and quiz questions) versus the science-based content (contained in the lectures and learning topics). We attribute this preference to two things: 1) the structure used for the mobile cases followed the structure of the clinical reasoning process and it is likely that this was familiar to students and they found it easy to follow. Two-thirds of students answered all the questions in the mobile cases and read the explanations, which supports our previous studies with elearning in which students highly rated the value of answering questions and reading the feedback as a learning strategy (MacLean, Scott, Marshall, & Asperen, 2011); 2) some of the material provided in the learning topics and lectures was quite detailed scientific knowledge, such as immunology, which the students had covered earlier in the curriculum.

With regard to gender, a significant proportion of females found the clinical reasoning tutorials easier to follow and reported using the mobile cases in 'free time'. The results do not support a 'digital native' distinction but are consistent with the literature on the topic (e.g. Bennett, Maton, & Kervin, 2008; see also Margaryan, Littlejohn, Vojit, 2011). 'Digital natives' were less likely to have viewed all the lectures, to have worked through mobile cases while travelling and less likely to have found the mobile cases easy to use. However, 'digital natives' were more likely to have answered all the questions in the mobile cases, read all the explanations and found the structure of the CRS tutorials easy to follow. By contrast, 'digital immigrants' were more likely to have viewed all the lectures, worked through the mobile cases while travelling and were more likely to have found the mobile cases easy to use. However, digital immigrants were less likely to have answered all questions in the mobile cases and read the explanations, and were less likely to have found the structure of the CRS tutorials easy to follow. The lack of conclusive evidence of a digital native distinction concurs with views expressed by Bennett et al '…that a proportion of young people are highly adept with technology and rely on it for a range of information gathering and communication activities. However, there also appears to be a significant proportion of young people who do not have the levels of access or technology skills predicted by proponents of the digital native idea' (Bennett, Maton, & Kervin, 2008, pp. 778-779).

Conclusion

This project was conceived to provide students with flexible access to learning materials, with the expectation that making these materials available on mobile devices would give students the opportunity to consolidate their learning while travelling or on free time whilst on their clinical rotation. Most students reported the mobile cases enabled them to learn new information and revise previous learning, and that the tutorials were easy to follow. However, the survey results showed that students did not engage with them as intended, with only one third of students reportedly using these resources while travelling and just over half using them during free time while on clinical placement. We also found that more females used them in their free time on placement than males and that the digital immigrants made more use of the mobile cases while travelling than their younger counterparts. The type of device students used also did not affect their experience, which is surprising given that the cases were designed for the Apple iOS. Future research will explore the influence of educational background (first degree qualifications) and other factors on how students perceived the mobile case-based learning scenarios. These findings will assist with future mobile learning design for this and other groups of students.

A design-based research approach implementing a palette of educational technologies to foster 21st century skills

Janette Kruger
School for Continuing Teacher Education
North-West University

This paper discusses how a design-based research approach will be used to design and implement a palette of learning technologies as part of a multi-mode approach in open distance learning. A conceptual-theoretical framework is proposed consisting of the interrelationship between pedagogy and technology and content, design principles, criteria for excellence and higher level outcomes. The intention is to outline guidelines for supporting teacher-students in an open distance learning environment, not only to master knowledge relating to a specific subject area, but also to acquire skills such as self-regulated learning, critical thinking and lifelong learning. Supplementing teacher-students' knowledge and skills will enable them to prepare their twenty-first-century learners for the increasingly interconnected global society they will work and live in.

Keywords: Design-based research, authentic learning, 21st century skills, open distance learning.

Introduction

After eighteen years of freedom from the apartheid era, South Africa still faces a dysfunctional educational system. We need to recognise the effect of inequalities of the past on teaching and learning. For the sustainable future of education in South Africa, the South African government need to look at the prospects of our learners (Jansen, 2011). With tens of thousands of learners failing examinations on a regular basis, schools in South Africa need leadership and enthusiastic teachers. Teachers hold the future of their learners in their hands and for many of our learners, "a solid school education represents the only means for ending the cycle of family poverty" (Jansen, 2011, p. 41).

South African universities offering open distance learning (ODL) provide flexible learning opportunities to students. Many teacher-students teach in remote rural areas and ODL removes barriers such as time, geographical, social and economic constraints. With the growing availability of new educational technologies higher education institutions are in a position to address the changing expectations of students relating to the quality of the learning experiences that will ensure that teaching and learning are relevant to their needs (Garrison & Vaughan, 2008). Unqualified and under-qualified teachers in South African schools have the opportunity to improve their qualifications and teaching skills through ODL.

In addition to mastering knowledge in a specific subject area, these teacher-students have to attain skills needed to creatively navigate the twenty-first-century. Within the South African context many teachers attended dysfunctional schools and it is important to supplement these teacher-students' knowledge and skills so that they will be able to prepare their twenty-first-century learners for the increasingly interconnected global society they will work and live in. Contemporary literature on pedagogy recommends pedagogical practices involving interactive, authentic, technology enriched teaching and learning practices in order to enhance the learning experience of students (Herrington, 2009; Moore, Fowler, & Watson, 2007).

This paper discusses how a design-based research approach can be used to design and implement a palette of educational technologies such as paper-based guidelines, interactive white board sessions, screencasts, videos on DVDs, audio recordings; Mobi-site downloads, as well as content learning management systems as part of a multi-mode approach. The intention is to outline certain guidelines for supporting teacher-students not only to master knowledge relating to research methodologies, but also to acquire skills such as self-regulated learning, critical thinking and lifelong learning.

The next section contains an overview of the background to the project. This is followed by the conceptual framework and an outline of design-based research. These sections will be followed by a discussion of how the four phases of design-based research can be implemented in a programme to enhance the learning experience of students, as well as supplement the teacher-students' knowledge and skills.

Background

Learning inequalities remain problematic in South Africa. These comprise the diversity of students in terms of age, gender, language use, culture, insufficient Internet access and living in remote rural areas. The introduction of e-learning in ODL may offer a solution in the South African context, but insufficient internet access is seen as one of the major factors hampering the realization of e-learning potential in open distance education in the African context (Ololube, Ubogu, & Egbezor, 2007). Mobile learning (m-learning) may provide a solution to the challenge of access to the internet, as the scale and ubiquity of mobile networks often provide the only infrastructure in rural areas (GSMA, 2010).

Teacher-students in open distance education require more and diverse support and scaffolding to acquire skills and competencies often far removed from their daily existence and environments. With the use of the palette of learning technologies teacher-students will have the choice to opt for learning activities best suited to their requirements and needs. Spector (2001, p. 8) notes that the "big lesson about technology and learning from the 20th century is that less is known about how people learn than many educational researchers are inclined to admit". Irrespective of the type of learning experience, learning with technology offers the advantage of allowing students the freedom of choosing *when*, *what*, *where* and *how* they want to study. A structured approach to combining pedagogy and technology may contribute towards addressing learning inequalities effectively, and may also foster 21st century skills in an open distance learning environment.

The School of Continuing Teacher Education (SCTE) of the Faculty of Education Sciences at one of the largest distance learning universities in South Africa offers open distance learning through an 'off-campus' mode of education to unqualified and under-qualified teachers. The SCTE offers three in-service programmes: the National Professional Diploma in Education (NPDE, 3 years, NQF level 5), the Advanced Certificate in Education (ACE, 1 year, NQF level 6), and the B Ed Honours (B Ed Hons, 2 years, NQF level 7). Currently there are approximately 27,000 distance students enrolled (NWU, 2012). These students live in South Africa and Namibia, mostly in remote and deep rural communities. There are 35 study centres all over South Africa and Namibia. Contact sessions during weekends form the core of the student support system at these centres. Facilitators are employed and trained to tutor the different modules at the centres. For each module, three contact sessions and one vacation school per semester are presented, comprising an introduction to the module, content coverage and preparation for the examination. At present lecturers use interactive white board sessions as a synchronous approach of contact with the students. Learning materials are mainly paper-based, consisting of study guides, text books and a DVD containing additional information such as PowerPoint™ presentations and video footage. In line with current trends in the field of open distance learning, the SCTE has started to implement the use of ICTs such as Moodle, a learning management system (LMS), interactive white boards (IWB) and mobile learning (m-learning) to supplement paper-based learning materials.

The project reported on in this paper relates to the Bed Hons programme where research facilitation is oriented as a preparation to read master's level. The author is responsible for the research methodology modules in the Bed Hons programme. The assignments for these modules consist of a theoretical assignment and a proposal for the initial module, and a research report in the second module. In an effort to assist facilitators and students, the author compiled comprehensive guidelines on the writing of a proposal and research report, but realized that more and varied support is needed to assist the teacher-students. More importantly, they need a set of skills such as lifelong learning, self-directed learning and critical thinking skills in order to creatively navigate the twenty-first-century. A combination of design-based research and design principles may be the answer to utilize a palette of learning technologies to address learning inequalities in an open distance learning environment. Teachers in South Africa need all the support they can get in the role as future makers to realise a sustainable future for education in South Africa.

Conceptual-theoretical framework

Conceptual distinctions

Researchers use several conceptual frameworks to underpin research on new technologies in teaching and learning. Stoner (1996) adapted the systems analysis and design life cycle approach for the integration of learning technology in teaching. The adapted version consists of nine phases in the cycle: initiation, analysis and evaluation, selection of learning technologies, design integration, implementation, monitoring, adapting and evaluation of implementation. It is similar to a cycle followed in design-based research, but lacks the application of design principles and the different iterations for refining the design principles and hence not suitable for the implementation of this project.

Mishra and Koehler (2006) developed the Technological Pedagogical Content Knowledge (TPACK) that builds on the formulation of 'pedagogical content knowledge' of Shulman (1986), extending it to the 'phenomenon of teachers integrating technology into their pedagogy' (Mishra & Koehler, 2006). In this conceptual framework the primary issue is the knowledge a teacher should have to integrate technology in teaching and learning, and therefore also does not meet the needs of this project.

The conceptual model of Ossiannilsson and Landgren (2012) addresses quality in e-learning based on the benchmarking initiatives of European Union (EU) in collaboration with The European Association for Quality Assurance in Higher Education and the United Nations Educational, Scientific, and Cultural Organization, with emphasis on a holistic approach requiring change management from an organizational and pedagogical perspective.

Henderikx's (2011) advice is to incorporate the criteria of the European Association of Distance Teaching Universities' (EADTU) E-xellence programme into the conceptual framework of the project (Ubachs, 2009). The conceptual-theoretical framework for the implementation of a palette of educational technologies proposed in this paper comprises the following aspects:

- The interconnection and interrelation between technology, pedagogy and content, focused on the student.
- Design principles elemental in conducting design-based research and design principles as suggested by Herrington and colleagues (Herrington, 2006; Herrington & Kervin, 2007; Herrington & Oliver, 2000; Herrington, Reeves, Oliver, & Woo, 2004; Herrington & Standon, 2000).
- Criteria for excellence as expressed by the EADTU through the E-excellence project (Ubachs, 2009).
- Higher level outcomes aimed to be reached through the implementation of design principles and criteria for excellence.

Figure 1 illustrates the conceptual-theoretical framework proposed for the implementation of a palette of learning technologies in an ODL programme.

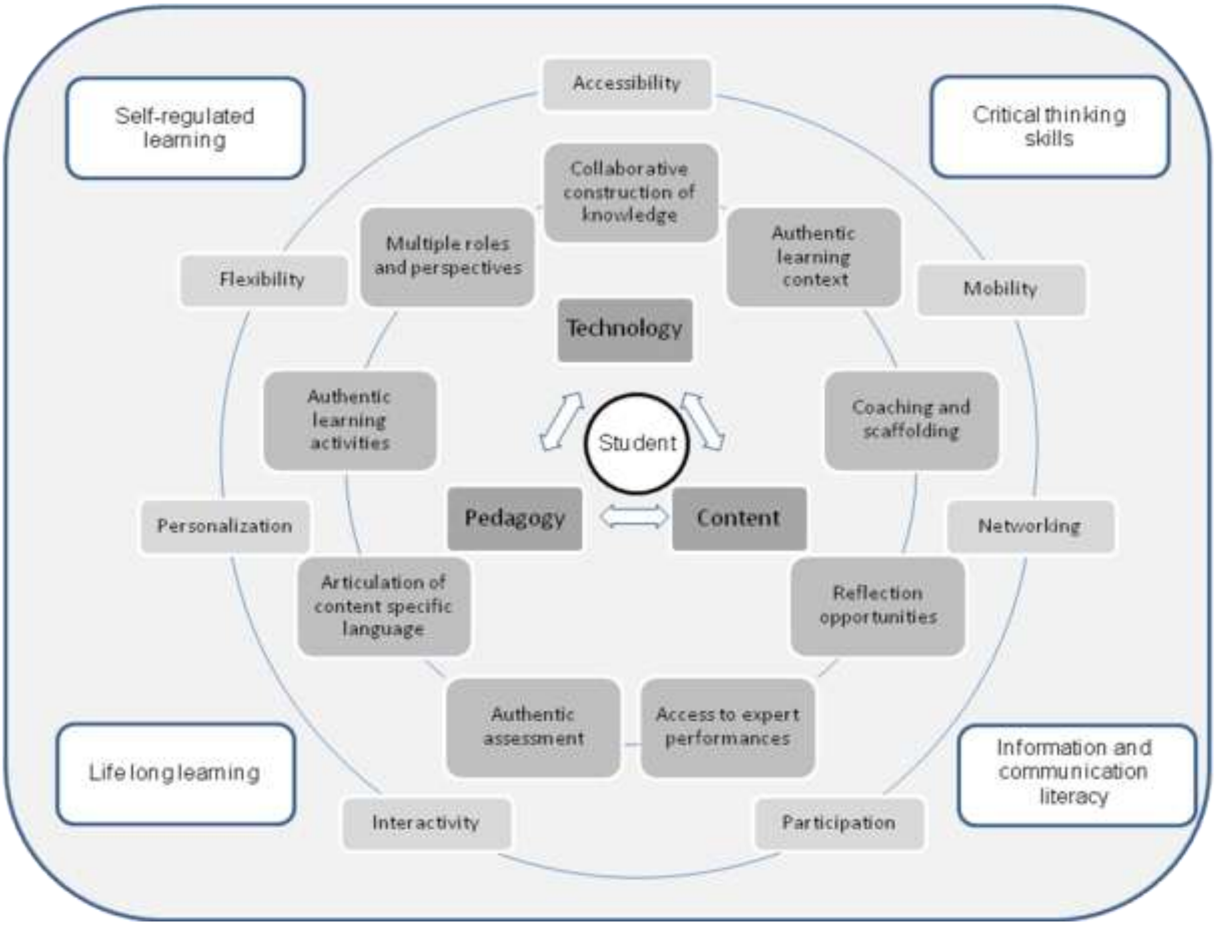

Figure 1: A conceptual-theoretical framework for implementing educational technologies in an ODL programme

The interconnection and interrelation between technology, pedagogy and content

Universities frequently use ICTs to deliver knowledge "where students learn *from* the technologies rather than *with* them as cognitive tools" (Herrington, 2009, p. 2). With the implementation of a palette of learning technologies, the intent is not to use information and communication technologies (ICTs) merely to disseminate content, but to **embrace the use of technology as cognitive tools to encourage thinking and understanding** (Herrington, 2009).

A student-centred approach to technology is proposed in this framework, with the emphasis on sound pedagogy to enable the student to interact with the content in a constructivist way. As learning with technology is a combination of "electronic"(*e),* and *"*learning", the emphasis is placed on the pedagogy that directs the technology (Nichols, 2007a). For best practice in e-learning the ideal seems to be effective and sound pedagogy combined with reliable, user-friendly technology. Therefore, "e-learning is *dependent* on the pedagogy", which, in turn, implies that the technology will be ineffective if the pedagogy is not sound (Nichols, 2007a, p. 2). Similarly, if the technology is neither easy to use nor reliable, "e-learning will be an exercise in frustration" (Nichols, 2007a, p. 3). Learning with technology has vast potential and offers challenges and opportunities for developing effective educational applications. In terms of the relationship between m-learning, life-long learning and open distance education in an African context, Traxler (2011) advises:

> Areas that must be explored also include the balance between top-down and bottom up approaches, progressive versus traditional values in education, the need for educational technologies that enable some Africans to compete in a global knowledge economy and for educational technologies that enable others to subsist and survive, the relationships between mobile learning, lifelong learning, distance education and classroom teaching, the ethical and cultural aspects of educational interventions and the boundaries and differences between various research communities and their methodologies for example between participative design and anthropology.

Constructivist learning theories are based on the premise that people construct their own knowledge and understanding through experience and reflecting on the experiences (Jonassen, Davidson, Collins, Campbell, & Bannan Haag, 1995). Students learn best when they are actively involved in the learning process and learning is reinforced when the process is social, relevant and offers multiple ways of learning (Huang, 2002).

The characteristics of learners in our schools are constantly changed by the rapid advancement of information technology. This puts pressure on teachers to develop capabilities in co-design, co-instruction, guided social constructivist and situated learning pedagogies and assessment beyond tests and papers, in order to stay abreast of the ever-changing learning styles of their learners. Teacher-students need to develop "neomillenial" learning styles to maintain effective teaching as the nature of their learners changes (Dede, 2004). Consequently there is a need for professional development which focuses on teacher-students' approaches to learning, their beliefs, attitudes and meta-cognitive understandings. In other words, it is necessary to facilitate teacher-students "to engage in self directed and lifelong computer learning" (Phelps, Graham, & Kerr, 2004, p. 50).

Design principles of the multimodal palette of educational technologies

Herrington and Oliver (2000) suggest nine design principles. These design principles underpin the design and development of the multimodal palette of educational technologies, as well as the collection of formative and summative data. A discussion of how these design principles will be implemented within the palette of learning technologies follows.

- *An authentic context that reflects how the acquired knowledge will be used in real life*
  Scenarios of typical educational research practice form part of explanations on the DVD, IWB sessions and screencasts in formats across different platforms, downloadable from Moodle.

- *Authentic learning activities*
  Scenarios of typical educational research practice form part of assignments and exercises in the study guide.

- *Access to expert performances and the modelling of processes and examples of outstanding completed research projects, reports and documents*
  Examples of proposals and research reports are available on Moodle.

- *Multiple roles and perspectives to enable students to gain perspectives on topics from various points of view*
  Links to videos on YouTube available on Moodle, e.g. a discussion between a qualitative and a quantitative researcher with regards to the application, advantages and disadvantages of the different research designs.

- *Reflection opportunities for students to reflect on their learning, the program and the learning experience*
  Within the collaborative learning groups the teacher-students will have the opportunity to reflect on their learning, the module and their experience with the use of the palette of learning technologies.

- *Collaborative construction of knowledge relating to opportunities for students to collaborate in small groups to problem-solve together*
  Facilitators will use Facebook as an educational tool to enhance peer group collaborative learning within a community of enquiry framework for online learning

- *Articulation of content specific language to encourage the students to discuss their newly acquired understanding of research methodology*
  Within the collaborative learning groups teacher-students will have the chance to articulate their newly acquired knowledge of educational research methodology.

- *Coaching and scaffolding for decreasing instructor involvement over time*
  Screencasts in five indigenous languages will be available on Moodle, to provide scaffolding and support for students in acquiring the necessary skills and understanding of research methodology.

- *Authentic assessment of real-life research scenarios*
  Scenarios of typical educational research practice form part of assignments and examination questions. and explanations on the DVD, with the IWB and screencasts.

Criteria for excellence

To successfully implement educational technologies, certain criteria for excellence such as those expressed by the EADTU through the E-excellence project (Ubachs, 2009) need to be adhered to. These are mobility, participation, personalization, networking, accessibility, flexibility and interactivity. A brief discussion of these criteria follows.

Mobility
Mobile learning (m-learning) optimizes communication between lecturers, facilitators and learners as it offers learning opportunities to rural or remote learners where the infrastructure for access to the internet is lacking (Evans, 2008). As communication and interaction are of pivotal importance in the learning process, m-learning can contribute towards the quality of education. M-learning has all the advantages of e-learning, with the added benefit of portability in the form of devices such as iPods, tablet PCs and smart phones (Evans, 2008). Lecturers should endeavour to embrace the strengths of mobile devices and design learning materials that utilize the convenience, connectivity and personalization that such a platform offers. Tablet computing presents affordable learning opportunities and are ideal for r one-to-one learning. The Zimbabwean government in partnership with Apple are planning solar-powered iPad devices for rural institutions without electricity. (Johnson & Brown, 2012). Other institutions could learn from this example and invest in the use of tablets to address the connectivity challenges of their students. This implies that, with the increased use of mobile and wireless technologies, “the time and place for learning, working, and socialising will blur even more” (Bonk, Kim, & Zeng, 2006b, p. 561). An important implication for this project is that mobile and wireless technologies may be more accessible to a wider range of individuals, thus creating greater opportunities for lifelong learning.

Participation
Bonk *et al.* predicted in 2006 that learning would become more individualized, hands-on and visual with added mobility. Their survey data show that blended learning will support a bigger range of learning styles and individual differences in future. Brown and Adler support this prediction, stating that the latest evolution of the Internet, Web 2.0, “is creating a new kind of participatory medium that is ideal for supporting multiple modes of learning” (2008, p. 18).

Personalization
As learning is a personal and individual experience, personalization and individualization of instruction is paramount to effective instructional practice. Consistent with authentic learning, instruction can be personalized by providing a palette of learning technologies in order for teacher-students to opt for learning activities best

suited to their needs. Allowing students to choose from various ways to interact with learning materials, using different instruction approaches and providing self-assessment tasks to verify their progress will empower them to make decisions and reflect on their learning (Rule, 2006).

Networking
Blended learning offers opportunity to connect people, activities and events. With increased individualization, blended learning promotes collaboration, and contributes to greater connectedness. With the palette of learning technologies our teacher-students will have the opportunity to collaborate, share and create knowledge.(Van 't Hooft and Vahey,2007). In confirmation of this, the findings of the study done by Laird and Kuh (2005, p. 232) suggest that the investments in making information technology available to students are paying off as students engage in educational practices actively and collaboratively.

Moore *et al*. (2007) discuss the possibilities of using tablet PCs for sharing information among students, as well as for problem-solving and problem-posing exercises in large or small group settings. Downes (2006) describes how the web changed from "being a medium, in which information was transmitted and consumed, into being a platform, in which content is created, shared, remixed, repurposed, and passed along" by the "newly empowered learner.". With the advent of Web 2.0 come E-learning 2.0 which, according to Downes, are "not a single application, but a collection of interoperating applications – an environment rather than a system". He argues that E-learning 2.0 has the potential to empower students in a completely new way. Brown and Adler (2008, p. 18) concur and argue that "the most profound impact of the Internet, an impact that has yet to be fully realized, is the ability to support and expand the various aspects of social learning".

Accessibility
With the fast-changing job requirements and expectations, Bonk *et al.* predict that on-demand learning will become a requirement of a global workforce(2006b). The web will be used to provide timely, authentic information for the solving of case problems. The present trend towards problem-based learning, scenario learning and online case-learning will continue, with the pedagogy employed and the learning results as the most important aspects rather than the actual technology used (Bonk et al., 2006b). Brown and Adler (2008, p. 18) argue that "the most visible impact of the Internet on education to date has been the Open Educational Resources (OER) movement which ensures free access to an extensive range of learning materials. Use of the internet has enabled students to access powerful instruments and simulation models (Brown & Adler, 2008, p. 18).

Flexibility
Using a palette of educational technologies, including e-learning, is "a way to increase flexibility in and improve access to postsecondary education" (Oblinger & Hawkins, 2005). With the growing population of adult learners having to balance their work, family life and studying, open distance learning enhanced by e-learning is a workable option and offers the advantage of allowing students the choice of when, where and how they want to study (Evans, 2008; Oblinger & Hawkins, 2005).

Interactivity
"Learning-by-doing is generally considered the most effective way to learn" (Lombardi, 2007). As with personalization, interactivity is an important aspect of a successful learning environment (Oblinger & Hawkins, 2005).

Higher level outcomes

Life-long learning
Our teacher-students need to keep abreast in a world where technology is changing on a daily basis and new training courses are continually introduced in the workplace and in higher education institutions. Lifelong learning is no longer a dream, but has become an essential requirement in the striving towards professional development. In order to meet this requirement of lifelong learning, technology-enhanced learning environments, such as blended learning and e-learning, are utilised increasingly in higher education. These technology-enhanced learning environments make use of the swiftly growing and expanding potential of technology (Beller & Or, 1998; Bonk et al., 2006b; Moore et al., 2007; Oliver, Herrington, & Reeves, 2006; Souleles, 2004; Surry, Ensminger, & Jones, 2005).

Self-regulated learning
An important objective of the implementation of the palette of learning technologies is to help our teacher-students to acquire the cognitive skills and inclinations to become self-directed learners. With the advantage of

m-learning the teacher students will be able to study the way Sharples (2000) quotes the UK Government's Green Paper on lifelong learning:

> In future, learners need not be tied to particular locations. They will be able to study at home, at work, or in a local library or shopping centre, as well as colleges and universities. People will be able to study at a distance using broadcast media and on-line access. Our aim should be to help people learn wherever they choose and support them in accessing how they are doing and where they want to go next.

Critical thinking skills
As future makers, our teacher-students need to develop key competencies for sustainable development within the South African education sector Barth et al. (2007) report that, with regard to the acquisition of key competencies, data from their research proved reflection to be one of the significant learning processes. Taking a critical stance with regard to one's actions and having the ability to reflect on them seems to be a decisive prerequisite in the learning process. On an individual level, reflecting on one's personal method of learning, questioning and examining tried and tested routines are necessary steps in the learning process. These authors contend that, in group context, "reflecting on the collaboration leads to identifying possible solutions which could take new, as yet, untried directions" (Barth et al., 2007, p. 425).

Information and communication literacy
For a sustainable future within the South African context, teacher-students need to develop relevant competencies such as information and communication literacy as they must be able to prepare their twenty-first-century learners for the increasingly interconnected global society they will work and live in. In their article on the development of key competencies for sustainable development in higher education, Barth *et al.* (2007, p. 416) state that, seen against the backdrop of globalisation, "acquiring relevant competencies within and by academic work cannot be a private concern of faculty, staff or administration. Absolutely essential is a new learning culture which does not confirm academic tradition, but examines its potential for a sustainable future, in an open-minded and participative process".

Institutions should create a supportive organisational climate for e-learning as a support for face-to face training programmes in skills development. Providing programme facilitators trained in coaching participants, focusing on the accomplishment of self-directed learning, assisting participants in the attainment of goals, modelling positive emotive skills, and encouraging the practice of new skills may help to realise the promise of blended learning (Kruger, 2008).

Design-based research

Design-based research will explore how to design and develop authentic learning experiences with a palette of learning technologies addressing learning inequalities in an open distance learning environment.

Phase 1: Analysis and exploration of the problem

Phase one addresses the problem: the analysis and exploration of practical problems by the researcher, practitioner and designer and a literature review. With an instructional design background, the author will fulfil the roles as practitioner, researcher and designer. During this phase the researcher will articulate the problem, have discussions with practitioners and carry out a literature review on work that has been done in the field. At the end of phase one the researcher will formulate the research questions (T C Reeves, 2006).

Up to date two studies have been done as part of phase one. The author adapted the Charles Sturt University Student Educational Technology Survey to determine the teacher-students' use of educational technology, their skills in using these technologies and how they expect these technologies to help them with their learning. In the second study the author explored the views of facilitators regarding the use of screencasts to augment learning materials in open distance learning (Kruger, 2010).

Phase 2: Development of a possible solution to the problem

During phase two solutions will be developed, informed by existing design principles and technological innovations. Design principles as suggested by experienced researchers in the field will be applied to design authentic learning activities to address the problem (Herrington, 2009; Herrington & Kervin, 2007; Herrington et al., 2004). Technologies to be used are interactive whiteboard sessions, screencasts, DVD with videos and interactive learning activities on Moodle.

Phase 3: Implementation and evaluation

For the duration of phase three the solutions developed in phase two will be implemented and evaluated in iterative cycles. During this phase data will be collected and analysed in order to answer the research questions. The researcher will modify the learning environment pending the attainment of the pedagogical outcomes.

Phase 4: Reflection and reporting

In phase four the researcher will reflect on the process followed to refine the design principles implemented. These refined principles could inform other researchers in similar situations (Thomas C Reeves, Herrington, & Oliver, 2005).

Conclusion

With a design-based research approach, the author proposes to implement a palette of educational technologies to outline guidelines for supporting teacher-students not only to master knowledge relating to research methodologies, but also to acquire skills such as self-regulated learning, critical thinking and lifelong learning. Reeves *et al.* (2005, p. 110) state unequivocally:

> Certainly, the need for a more socially responsible research agenda in instructional technology has never been greater. Instead of continuing to tinker around the edges of teaching and learning challenges by conducting quasi-experimental studies focused on small changes in learning environments or even conducting one-off qualitative studies of esoteric cases, instructional technology researchers and their colleagues in other academic disciplines must begin to tackle the huge problems we face in the first quarter of the 21st century. Design research offers a positive step in that incredibly important quest.

Research emanating from the implementation of the palette of educational technologies, will hopefully contribute towards a better understanding of the pedagogical practices involving interactive, authentic, technology enriched teaching and learning practices. This will not only enhance the learning experience of teacher-students, but also foster the attainment of 21st century skills. These are crucial to supplement our teacher-students' knowledge and skills, since they are future makers, responsible for creating a sustainable future for education in South Africa.

> "Education is the most powerful weapon you can use to change the world." Nelson Mandela

This paper is an account of a research project being undertaken for an Australian Learning and Teaching Council grant to develop *Indigenous On-Line Cultural Teaching & Sharing*. The project is built on an existing face-to-face interactive presentation based on the theme of Australian Aboriginal Kinship systems, which has been designed for teaching university and school students and their teachers and describes the process used to develop web services that aim to provide more interactive and exploratory learning environments.

We are collecting knowledge of the Aboriginal culture in relation to a theme and presenting this in a teaching framework that can be continually updated with community stories. We are consulting with Aboriginal and non-Aboriginal students and community members who attended interactive presentations to gather ideas for transferring the model to online format and presenting it with stories relevant to the specific professional areas of our students, such as sociology, law, education and social work. We present here the teaching framework developed in this project for Aboriginal cultural teaching online.

Keywords: Aboriginal, Indigenous Culture Online, Teaching Framework, Action Research

Introduction

The online course has been developed to increase the access to a highly successful Kinship presentation developed by Riley (Riley and Genner, 2011) by placing it online. Riley is a Wiradjuri and Gamilaroi woman with over 30 years experience as an educator in NSW. The course is now an online workshop comprised of videos of the face-to-face Kinship presentation, interleaved with short role-play games for students to gain some understanding of the different sections and levels of relationships involved in Aboriginal Kinship. These games require a simple selection by students to put their icon in the correct relationship with others on the screen.

A second part of the online system is being developed to provide a repository of community narratives that are related to themes and concepts in the workshop and which will be available for future generations to both hear and update. We have designed a set of interactive scenario-based games where the narratives are being inserted for teachers and their students to listen. Using innovative web services, teachers will select the narratives that are relevant to their course, and link these within the range of scenarios. The stories assist students to relate their future work to situations described by the narratives. In the scenarios students are to choose the way they relate to the characters, listen to their narratives, and become aware of their own role in communities in relation to services provided with and for Aboriginal people.

While the project aims to extend to multiplayer systems in future, at present we are working with single-player

[1] *The Australian Government Office for Learning and Teaching has provided support for this project. The views in this project do not necessarily reflect the views of the Office.*

simulation games. The work we describe here fit the definition of simulations (Wills, 2012), although it involves one person role-plays with computer-generated models or agents. It is similar in learning design to PRessure Point! as described by Demetrious (2007) where models use the pre-recorded voice of people to provide the main narrative learning material. For our project, these stories will be collected from Aboriginal students, staff and Aboriginal community members as well as some non-Aboriginal professionals, to provide a wide variety of experiences from which undergraduate students can construct their own understanding of the cultural conflicts that can arise from colonizing and ethnocentric world-views.

The learning system is designed to reflect where possible Aboriginal knowledge sharing processes. This is traditionally through interwoven stories, song and dance at a community ceremony or corroboree (Langton, 1997). These ceremonies or performances provide for re-enactment and are an environment for experiential learning of the subject matter. While web services provide a form of mediation that is representational and more static than previous methods of knowledge sharing (Verran & Christie, 2007), this medium does provide for greater user adaption and generation of material by many distantly located authors.

Figure 1a Introduction with comments and panel to upload narratives
1b Narrative browser

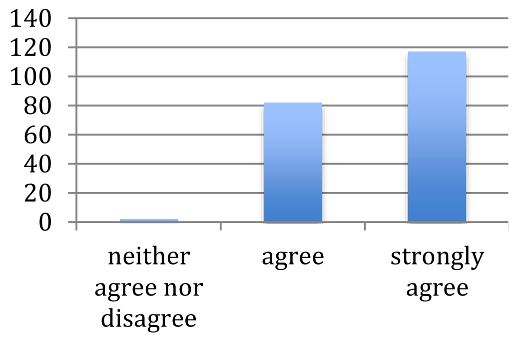
In selecting to move the presentation online, we considered work such at that by Donovan (2007) who notes there are overlapping commonalities between Information Communication Technologies and Aboriginal pedagogical systems, which include the experiential nature of learning; the ability to create an immersive space that is flexible to the specific learners and their context; and the ability to combine material from many informants. Furthermore we wish to utilise the notion of performance, and develop the individual narratives into a coherent story, in this case using simulation environments.

Evaluation of Interactive Presentation

A reflective critique of the interactive presentation pre-dates the project and has been ongoing since the original interactive presentation, developed in 1987, which has since been presented in many educational, organisational and community settings since this time. In the last six years the interactive Kinship presentation has been made available to various groups of students and staff at public schools and Universities across Sydney. It was the success of this presentation that provided the impetus to develop an online version that would enable more people to benefit from learning these concepts, and allow more aboriginal people to contribute to the experiential stories used in the teaching.

Feedback from interactive Kinship presentation to under-graduate Education students

In 2009 the interactive Kinship presentations were provided to all first year educational students at Sydney University. At the end of each interactive presentation, students are asked for comments on what they found useful and what could have been explained better, for instance issues that were hard to understand when presented in this format. This was for the presenter to evaluate what concepts she may be assuming too much prior knowledge from the students and so allow her to adapt her presentation to their needs.



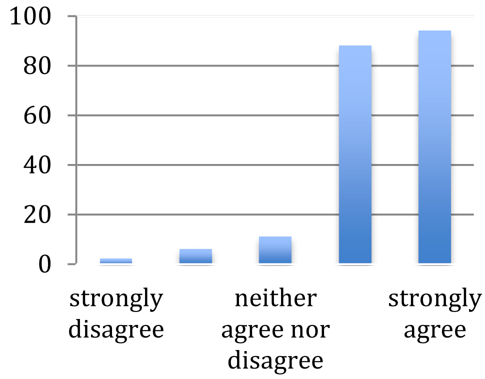


Figure 2a Survey Results – The activity helped me understand the nature of Indigenous relations in contemporary Australia
Figure 2b Survey Results - I could see the relevance of the activity to my work as a teacher

The presenter ran eight sessions with up to 64 students per session over a week. After interactive presentations, several cohorts of students were asked about their experience, and of 430 attendees, 201 returned the questionnaires that asked students about their experience. This is a response rate of nearly 50%.

What has been most interesting is the nearly unanimous response from teaching staff involved in organising the workshop for their students, and other school staff who attended workshops at the Regional Education Department Office. It was clear that, while they responded well to the first presentations, those who attended more than once were more able to reflect on the general concepts portrayed in the presentation. The main concept is how the Aboriginal world view focuses on relationships within a society and 'contrasts to the colonial power's liberal world view based on individual responsibility'. These contrasting world views can be seen at the core of most of the legal issues that affect Indigenous Australians' (Mitchell, 2011).

Further comments were collected from students both at these presentations and later. We provide some examples below from the under-graduate Education students. We have also collected comments from Social Policy students, law professionals and Aboriginal students to help develop the teaching in the online system, which we discuss next.

Table 2 Sample comments from 2009 Education students

Survey	Comment
2	Effective education is dependent on an understanding of culture and the implications of that culture on an individual's learning
20	As I may have Aboriginal students in my class and if I were to call upon a wrongdoing of one of the students and his parents did not turn up, I would comprehend why other members would come instead.
31	As a teacher understanding these different communities and different people's background
35	It is important to understand why some children behave differently and how we can learn to understand and help them.
38	Helps understand the relationship between kids and adults in schools in regard to parents/guardians
50	To avoid misconception and to teach children and help them understand the truth and why the indigenous community is the way it is today.
64	Promotes a better understanding of a student Aboriginal background, historically, politically, culturally, etc.
75	Indigenous Australians may have certain belief/cultural systems that may affect their development. Nonetheless teachers are required to respect that.
83	Definitely. Helps me understand the culture better and have more cultural sensitivity.
93	This was very relevant because it helps educators understand why parents (biological) were not always involved in their Childs education, that aunts or uncles may be more involved because of the skills they have.
